Question No. 8. Canals which are ordinarily able to obtain a perennial or cold weather supply are the following:

Eastern Nara (2) Jamrao Canal, including Dim.
system, omitting (3) Mithrao.
(4) Thar.
(5) Eastern Nara.
(6) Heran Wah.
(7) Sukkur Canal.

Question No. 9. Extent to which the supplies to the canals have been affected, if at all, by the withdrawals for new canals in the Punjab.

ME. H. G. PALLISER, UNIEF ENGINEER, INDUS RIGHT BANK DIVISION.

I cannot find any ovidence of the canals in this Division having been prejudicially affected by withdrawals for the having been prejudicially affected by withdrawals for the hanjab. The question would, of course, only arise with respect to the rabl or cold weather discharges, which unfortunately have not been gauged in Sind, except for the last two years by the Indus River District, so that no definite information is forthcoming by which the cold weather supplies of the river can be compared before and after the opening of the new Punjab Canals and one or two I believe, in Bahawalpur.

2. I am inclined to doubt whether our rabi supply to the Sukkur Canal has been practically affected up to date by Punjab withdrawals, but it is of course obvious that there must be a limit, and that any further extensive draw-off above Sind might materially diminish our cold weather supply and diminish our revenue.

MR. E. F. DAWSON, SUPERINTENDING ENGINEER, INDUS LEFT BANK DIVISION.

So far us can at present be ascertained, the canals in the Indus Left Bank Division have in no way been affected by the withdrawals for new canals in the Punjub.

Extract from letter No. 01394 I., dated 11th October 1901, from the Secretary to Government, Punjab, to the Commissioner in Sind.

Question No. 10. Necessity for (11) benefits to be derived from, and (12) practicability of constructing a weir at Bukkur near Sukkur.

Me. H. G. Pallises, Chier Enginees.

The reply to enquiry No. 10. whether the necessity for n weir nt Bukkur, as proposed by Sir Evnn Jnmes, has been felt, is in the negative.

And to No. 11, the Sukkur Cuml and possibly the Sind and Ghar Canals would be benefited by the construction of such a weir.

Question No. 13. Do the results so far attained on the Jamrao Canal indicate that it will be as successful, and that it will irrigate as large an area as anticipated in the revised estimate?

#### Mr. E. F. Dawson, Superintending Engineer.

The results so far attained on the Jamrao Canal indicate that it will be as successful and that it will irrigato as large an area as anticipated in the revised estimate, viz., 258,000 acros a year. Though in the Southern District, Jamrao Canal, all the water-courses have not been completed, and nearly half the area of the land under command in that portion still remains to be given out for onlivation, with the canal running only two-thirds full, the revenue during 1900-01, the first full year of the working of the canal, exceeds that of the estimate (Rs. 3,95,546) for the seventh year of its working by nearly Rs. 20,000, while the area (176,137 acros). vide Statement G, differs very little from that estimated (178,750 acros) for the seventh year, and in a few years more will even exceed the estimate to probably a great extent.

Question No. 14. Statement showing Lands irrigated in 1900-01 from private Canals which are not un ter the control of the Public Works Department.

Question No. 15. Generally, what scope is there for extensions of irrigation in Sind, including Khelat or other foreign territory, and in what order should they be considered?

Mr. E. F. Dawson, Saperintending Engineer, Indus Left Bank Division.

There is no further scope of financially successful cultivation in the Northern and Control Hydernbad Canals Districts, but in the Fuleli and Eastern Nara Districts there are, however, large tracts of uncultivated waste which might be brought under irrigation, but nothing definite can be said till the contour survey of the Fulcli District, which has now been commenced, is completed, and the Eastern Nara District is thoroughly surveyed. The extention of irrigation, however, dopends on outside colonists, as the area at present outlivated in this Rivision is more than sufficient for the labour available from the present population.

No. I.—Preliminary Note on the Proposed Burker Weir by Mr. E. F. Dawson,

With reference to the questions asked about a Bukkur weir, I am still not in a pesition to say whether it is practicable or nut. Enquiries are, however, proceeding, and I hope to know more about the site before the Commission reach Sukkur next mouth.

In the meautime, caquiries should proceed regarding possible increase in revenue, if the weir is practicable and is ever built. Very approximate figures will suffice in order to enable us and the Irrigation Commission to decide whether the scheme is worth proper investigation. That is all that is proposed now. I am not proposing a weir yet. This is merely our preliminary enquiry to get some idea of the revenue reasonably to be expected and the return it would yield on the probable costs.

For the present thou, let us assume the wier is practicable, that there will be no practicable engineering difficulties which cannot be overcome. I will, in the course of the next week or so, have completed an estimate of approximate figures of cost.

Meantime, to form any opinion of the roturn the project should give, it would help if the revenue were considered. Massa. Rien and Tupper should be able to assist. The Commissioner's knowledge of the country is, I nuderstand, also considerable.

The work under consideration is a low weir of solid mascury on which to construct falling gates. With gates up we would have the water in the river at Sukkur nlwnys standing at or nbove 125 ft. on the Bukkur gauge. In the flood season, the gates—a part of them—would be dropped, and we would always maintain the river at the present average height of Bukkur or above it—something over 13 ft. on Bukkur,—and maximum floods might rise to 21 or even 22 ft. Bukkur as compared with the present maximum of 18 ft. Of course bands, etc., will be raised to stand this increased flood height. The danger this might expose us to will be considered hereafter, but please neglect it for the present. We are assuming the scheme as practicable just now.

Here, then, are the conditions for the purpose of revenue estimate.

A 12-ft. weir at Bukkur will bare effect as follows on the Sind Wah:-

When now, on about 10th Moy, we get a foot of water on the sill of the equal, the weir will raise the level to 1.66. (Trivial.)

On 1st June, in average years, we have 3:50 ft. on the Sind Wah gange. With the welr, it will be increased to 4:90—say, 5-ft. (Important increase.)

On 28th June, we have now 6-ft. With weie, this will be increased to 8-ft. (Important increase.)

The weir will render up practically independent of changes in the mouth of the Sind Wah. It will not, hawever, increase the oupply in July and August: the present supply would be maintoined then. Little more out be said than this.

The early supply would be assured, and supply in July and August remain practically unaltered.

The weir will convert the Sukkur Canol, into n perenuiol cinal, and have an excellent supply throughout tho whole year.

A new head from above the weir to the Ghar will enneert the Ghar into a percunic causl. It might take a line somewhat as shown an the ucc impanying tracing, and would not only give water to a large tracet which has suffered of late years, but would render the Ghar practically independent of changes in the river at the month of the Ghar, and should suffice for an area much in excess of any area over yet cultivated.

No. II.-Note by Mr. Dawson on the Proposed Weie at Burkur.

Three questions, Nos 10, 11, and 12, have been asked concerning a weit at Bukkur. I take No. 11 first.

11.—" What canals would be benefited by the construction of such a Weir, and to what extent?"

The Ghar, Sukkur, and Sind Canals on the right bank and the whole Jamran and Eastern Nara systems an the left bank would be benefited. With a weir at Sakkur, it will prolably also be advisable to re-eansider a project for a better supply to the Khuirpur State and the Hyderabad District, Air. Joynes's Hyderabad Canals praject having been condemned partly becouse the water was carried for a great distance at a considerable dapth below the surface of the ground.

- of the ground.

  2. With a weir at Sukkur, the Ghar and Sukkur Canals (with a new feeder to the former from abore the weir) would be acconverted into percunial canals, and be rendered capable of annually irrigating a camblaced area of kharif and rabi at least equal to, if not causiderably greater than, the sum of the greatest kharif and rabi areas ever yot irrigated. The Sind Wals, being nearly 30 miles up river, would be only slightly improved, but there is no doubt that it would be improved to the extent of having a better early supply and also a somewhat better late supply than at present.

  2. The present supply to the leaves and Parkers.
- at present.

  3. The present supply to the Jamran and Eastern Name systems is taken off from the river above Bukkur through the Nara Sapply Chounel and is ample for requirements, except, perhaps, in a low river. It was despened in 1892 and is supposed to be sufficient, but frame the fact that hariferops on the Jamran are now being irrigated by rotation in this the scenad year of cultivation under the Jamran, it may not unreasonably be concluded that a limit to extensions an tha Journa and Eastern Nara systems will-seen the received. The Jamran is, however, already irrigating nearly the full duty of the water it can carry, so that there is no fear that the present supply channel is not capable af fulfilling its intentions; but if fineds can be cut off from the Eastern Nara Valley, there is room for considerable extension of cultivation there, and, were a weir constructed at Sukkur, the whole off this area and that under the Jamrao would be rendered independent of finetuations in the helight of the river supply.
- 4. The increase in revenue these improvements will yield is a question far eareful enquiry. It may possibly be raughly estimated by the Revenue afficials without much difficulty for the right bank of the river, and the Commissioner in Sind will, perhaps, be able to answer the question before the Irrigation Cammission vielt Sukkur, but it may softly be said that it will amount to lokhs of rupe's on the Sind, Sukkur and Ghar Canals alone; and, even neglecting the left bank improvements altogether, it

appears at first sight, at any rate, that a project for the weir Is worth investigating further.

5. I take question 10 next.

#### 10.-" Has the necessity for a Weir at Bukkur as 1 toposed by Sir Eran James been felt?"

The Ghar and Sokkur Canals, two of our most important revenue-yielders in Sind, have for years shown great fluctuations in irriguted areas consequent on variation of heights of water in the river at different seasons of the year, and tho Ghar has affered also particularly of late years from changes in the dhand supply where it takes off from the river. Indeed, camplaints have been so loud and real, especially as regards the higher areas user the month of the canal, that the Irrigation Department contemplate undertaking a survey with the object of completely remodelling the canal. Though, however, large additional areas may be brancht under cultivation by a re-modelled canal, it is rather improbable that the higher lands near the month of the Ghar will receive hensift from such a scheme so long as a month is taken direct from the fiver any where below Sukkur. Even a manth from above Suklur would not appreciably unprove the present canditions, as the antural levels do not permit of it, unless a weir be constructed to raise the supply level at the lind, and the only way in which the higher lands of the Ghar can be made independent of the changes at the month and af annifavourable falls in heights of the river is by the construction of such a weir.

6. In sa for, then, as improvement in the sapply has

G. In sa for, then, as improrement in the supply has been known to be desirable on bath the Sukkur and that Canals, the necessity for a well at Bukkur seems to have been recognised for years. Indeed, so long ago as 1835, Licutenant Fife, I...K., proposed taking off a now head from shore Sukkur for the Ghar Canal, but it would appear that the aver-worked Engineers in Sind have never had time to spare for the inrestigation of a praject for a weir, and the site has, I believe, generally heen supposed to be extremely unsuitable and difficult, if not impossible, for that abject. I have more than ance been informed that there was a hole in the river hed of the Rohri garge which has never been bettomed by soundings. This brings me to question No. 13

## 7. 12.-" Have any investigations been made to show the practicability of such a Weir ?"

- 8. Last season, Mr. Corbett, Excoutive Engineer, Indus River Distilet, and I sounded the Rohri side channel from a launch, and seemed to find bottom all the way through it, the deepest sounding recorded being 68 feet, and a few soundings taken across the channel abuve the garge apparently gave rock bottom at deepths in most places than 30 feet and in mony places and; a few fact below law-water level Further investigation could not be made before the inendation season, and it was postpened until this cold weather. I have now had a hurried creas section taken as aligned by the section taken as line between the heads of the Sukkur Caral and Nara Supply Channel and attach horewith plan and rection, shret Na. 1, showing results. There has been no time far rehable begings to be made, and the bottom rock has been found merely by sounding and by prabing with an iron shed homboo and with a long iran bar under difficult caaditions, with the river 6 feet on the ange, so the depths shown may be some what insecurate; but those seems no doubt that rock can be found an this line at approximate doths given an the cross section, which are coundinge below a stage of 6 feet on the Bakkur garge. There is uncertainty abnot parts of the seetian shown datted.
- P. Much more favourable conditions may exist—the deep hole shown on the section may die out a few handred for up-streim; but without a complete survey of the led at the river for some hundreds at feet up and down stream, there can be no certainty of this, and I therefore propose at this stage of the enquiry to assume that the section is as plotted.
- as plotted.

  10 Starting from the Sukkur side, we find rock at depths of from 1 to 8½ feet below the zero of the Bukkur gange for a distouce of 2,400 feet; from 8½ feet at 2,400, it drops to about 36 feet at chainage 2,600; and from 3,100 it sizes to 9 feet at 3,300; and onwards it gradeally rises until the Bukkur zero is met at chainage 4,600. With the exception of the deep partion between 2,100 and 3,300, there would be no serious difficulty in putting in the foundations for a well, although parts at it might here to be done under compressed all in suitable causeous. But

whether the 900 feet length in deeper water could also be satisfactorily dealt with is a question for more serious cousi-deration.

- 11. Before discussing this point, however, I propose to briefly review the whole project. There are difficulties attending it which are inter-dependent with the weir design.
- 12. For the present, let us assume that foundatious can be hid on this site and that we can construct on them a solid weir up to 3 feet on the Bukkur gaugs. Above this, we will provide a weir or dam fitted with suitable openings (regulated by gates) for the passoge of floods.
- 13. The calculations to find the effect of the weir on low and high river water levels involve fixing data-regarding height at which cortain discharges occur, their sectionial areas, velocities, etc., all of which are given in the attached "Colculations." All of the important data have been obtained from results of discharges measured in the last two years and from gauge heights of which we have a record for over 40 years to refer to. The lowest discharge for calculation purposes has been taken at \$0,000 ouble feet per second and the highest at \$00,000 cubic feet per second and the highest at \$00,000 cubic feet per second. The latter is supposed to occur without a weir at 18 feet on the Bukkur gauge, a height which has never been realised; and although the discharge at such a height might quite possibly exceed even \$00,00), it will not seriously affect the design, the height at which the moximum fleed is fixed being the important feature for that purpose.
- 14. The calculations show, with weir solid to height of 3 feet on the Bukkur gauge and with movemble gates of 9 feet height above this for width of 4,100 feet, that the following will be attained:—
  - Immediately above the weir the low-water level will
    be permanently raised to 12.5 foot on the
    Bukkur genge. It will gradually rise as the
    discharge increases on the river, and can be
    maintained by regulation of the gates at a
    height of 18 feet on Bakkur at all times when
    the river's discharge exceeds 200,000 cubic
    feet per second. (In practice, it would not probably be accessary to maintain this height:
    the gotes will be lowered to unintoin the water
    lovel only at height required by canal head
    works). The maximum flood discharge with
    gates open would pass over or through the weir
    at a height up-stream of the weir of 20.25 feet
    and down-stream at a height of 18 feet on the
    Bukkur gauge, ie, the construction of the weir
    will cause a rise in the maximum flood level at
    the weir site of 2.25 feet. (Of course, if gates
    can be provided at a lower level than referred
    to, this flood level will be lowered. However,
    the ostimates for protective embankments, etc.,
    are at present fromed, to be on the safe side,
    on this assumption.) At the Sind Canal,
    which is about 30 miles up-streom in low river
    and 25 or under in high water, the effect of
    the weir will be as follows:—
    - Where now we get one foot above sill on 10th May, we would have, with gates closed on the Bukknr weir, 1.65 on the Sind Canal.

      On 1st June, with an average river, we now have 3.5 on the Sind Canal and with the weir we would have 4.90.
    - On 29th June, we have 6 fect on the Sind Canal, and with the weir we would get 8 feet. Therenfter, gotes would probably be opened, and lovels in July and Angust would be much the same, but slightly bigher than nt present. The weir would have practically no effect on the Bagari or any canal north of the Sind; but it would give a permanent full supply for the Sukkur, and, with a new head or feeder from above it for the Ghat, would convert the latter as well as the former into perennial canals.
- 15. Attached short No. 2 shows the hydrogrophs of the river, after construction of the weir of Snkkur, and the Sind Conol, as compared with averages of the last ten years.
- 16. Sheet No. 8 is a general map of the country, showing weir site, lines of protective cubankment up-streem, and alternative lines for feeders of the Ghur Canal. The latter have been shown without any preparatory survey of the country, and are, of course, only approximate; but they serve as the basis of an approximate estimate of cest.

- 17. The first difficulty that arises is to select a suitable bend for the Ghar feeder. It must, if possible, be placed near the weir to secure its permanency; and with this object it will be advisable to pravide under-studees on the Sukkur side of the weir itself. There will probably be some difficulty in this, and it may have to be combined with a new head for the Sukkur Canal, but no definite opinion can be expressed on this point until proper surveys have been made and designs considered. Plou sheet No. 4 is the only information on the probable which gives useful infurmation on this point. It is probable that a suitable regulator in rock can be designed. If not, it will be necessary to consider the olternative or placing the regulator in the band line to the westward, but this would probably necessitate permanently maintaining a suitable dredger to keep open its freder channel from the river.
- 18. This ulternative would, however, have the very serious objection that the in-drought of such a large volume as this ennal would carry, namely, 6 to 7 thousand outle feet per second, might seriously endanger the safety of the hand itself, and also tend to encourage the admittedly possible estats the hand itself, and also tend to encourage the admittedly possible estats the hand itself, and also tend to encourage the admittedly possible estats at all likely to occur under existing conditions, with river bed levels at Sukkur well below the surrounding country; but, with the altered conditions of a weir blocking the lower levels of the discharge section of the main channel, it is not at all difficult to consective circumstances which would render the turning of the river not only quite possible, but probable. For instance, I believe, while there should be no difficulty in constructing suitable river embankments up-stream of the weir to withstand any chance of being breached merely by water pressure, that, if the river happened to take a decided trend towards the right bank, the correction of this tendency with raised bed level at the weir site might involve an expenditure of cnormous sums in the maintenance of suitable training and protective works, which, if onsuccessful in the early stage, would threaten disaster to the whole scheme.
- 10. I might dilate at considerable length on the possible dangers the river might threaten with altered conditions of bed such as have been considered up to this point, but it will be sufficient to state that, with the small amount of consideration I have been able to give the scheme up to the present. I would not no prepared to recommend the construction of a solid weir up to the level of 3 feet on Bukknr. This height has been chosen for the purpose of preliminary calculations of flood levels, etc., merely because at first sight it seemed suitable for that purpose.
- 20. The obvious conclusion is under-sluices in the weir must be provided in order to prevent interference with existing conditions of flood and water levels os little as possible. Whether suitable sinices can be built at the dopths necessary to secure this object is not so cavily unswered. It is a most interesting subject for consideration and discussion, but for the present I propose to proceed with my general review, assuming for the time being that the engineering difficulties are surmountable.
- 21. Estimato.-The project will include the following:-
  - (1) A weir or dum across the river so designed with under-slaices as to interfere with the height of flood discharges as little as possible, and also provided with under-slaices on both the Sukkur and Rohri sides of the river to secure a soon in front of the heads of the Ghar and Sukkur Canols on the Sukkur side and the head of the Nara Sapply Channel on the Rohri side
  - (2) A lock on the Robri side of the river for the pussage of boats and stemmers.
  - pussage of boats and steamers.

    (8) Protective embankments on each side of the river up-stream of the weir, suitable cross section, to safely withstand continued water pressure due to the maximum flood. The section chosen is as follows:—Top bank of 10 feet; top width at 6 feet above flood level; water and outside slopes 4 and 3 to 1, respectively, with an extra berm of 20 feet width at level of 2 feet below top water level added to the outside of the section.
  - (4) Head regulators for the Sukkur and Ghar Canals.
  - (5) Fcoder for the Ghar Canal, capoble of earrying a supply of 7,000 onbie feet per second.
- 22. The cross section for the weir has 16 feet width at 3 feet above the zero of the Bukkur gauge with down-

stream batter of 1 in 4 for a depth of 20 feet, and below that an increased batter of 1 in 3, which gives a width of 52 25 feet at 30 feet below the Bukkur rero. Allowing 2 feet for foundations, the whole quantity of masoury taken solid up to 3 feet on the Bukkur gauge amounts to 1,123,776 cubic feet. The openings for under-sluices will save at least half of the quantity above the foundations, but, to provide for a better class of facings, quoins, etc., at openings, one-third only is deducted. The total quantity up to 3 fact on the Bukkar garge will then he \$21,269 cubic feet, which is estimated at a rate of Rs. 150 per 100 cubic feet. Excavation for foundations is also taken at this late. Both rates are practically dauble those at which the same classes of work could be done above water, and should be sample in any circumstances, even under compressed insame classes of work could be done abare water, and should be ample in any circumstances, even under compressed nir-Tag fank well is esparately estimated. Above 3 feet, for estimating purposes, the weir wall is taken solid as was done below that level to simplify this approximate estimate. A 400,000 are allowed for under-sluices. Lump sums are provided for the lock and regulator. The Ghar feeder is taken as a canal, 220 feet in width carrying 11.75 feet of water for its whole length, half the length being taken 7 feet in embaakment and the other half length altogether in cutting.

#### 23. The estimate works out as follows :-

	Rs.
Freliminary Expenses, Survey, etc	50,000
Land Compensation	3,40,232
Weir	29,88,970
Lock	5,23,000
Protective Embinations	11,42,576
Regulator, Sukknr and Ghar	5,25,00
Feeder for the Ghat Canal	18,23,581
Total Works	72,05,959
Establishment at 213 per cent	15,68,532
Tools and Plant at 2 per cent.	1,43,907
Leave and l'easion Allowances at 11	•
per cent. on establishment	2,19,590
Interest during construction .	7,52,500
Grand Total, all Charges .	99,81,838
Or. 505-	
Wurks	73,60,000
Otler Charges	26,52,000
GRAND TOTAL .	99,52,000
Say	1,00,00,000

21. Recenue Return.—Mr. Tupper, Acting Collector of Larkana, has written a note on the expected additional area which will be cultivated, if the Ghar is converted into a percannal causal with feeder from above the weir site. He asthmates the additional revenue expected as follows:—

		Rs.
On Sakl ur Canal— ita'ndero Tabika On Ghar Cau il—	•	20,000
Kambar Taluka from Rs. 50,000 Rs 70,000, sav Nasirabud Taluka from Rs. 20,000	•	60,000
Rs. 49,000, say Lulkana Taluka	•	35.000 20,000
Son hern part of Palodero Taluka Toras	•	15,000

25. He, however, almits that he may have under-estimated the figures. I think that this is probably the case, especially when one examines the variation in the revenue realised on the Subkur and Ghar Capals for the past ten years. The figures have been as follows :

Canal.	Average realised for 10 years.	Maximum resh- extions	Minnoun reili- ertiors.	
Sakkur Canal	2, 15,359	3.13,422	1,(0,052	
Glar Caral	7 22,193	8,12,637	8,53,574	
Torth.	1'.67,552	11,57,219	1.70,230	

The difference between maximum realisations and averages should, I am of opinion, be taken as due to this project, because by construction of the weir both causis will be readered perennial and independent of the river, and the figure which represents this should be added to Mr. Tupper's estimate, which relates only to lands not at present brought under cultivation. under cultivation.

20. The figures of revenue due to the work would then be as follow :

					Rs.
On existing areas		•			2,19,900
On new areas,	•	•	•	•	1,50,000
		T	OTAL		3,69,900

27. The Sind Canal would also receive benefit, though perhaps small; so also would the Rukan, Rani, Sauro and Jamb an the Robri side, all aithm a distance of len miles above the weir. Unfortunately, I know nothing of these canals, which seem to be merely small canals taking off through sluces in the bund line, but owing to the large increase in higher supply which should be available at their heads it is probable that, taken together, they may be safely calculated to yield an additional revenue of at least half a lakh of rupees. The Siad Wah and other bind sluices on the right bank may also be credited with another half a lakh of rupees, and adding these figures to the previous expected realisation from the Sukkur and Ghar brings the total to Rs 4,69,900.

28. It is equivalent to n return of 6:40 per cent. on works and 4:70 per cent, on works and nil other charges, including interest, and, as this revenue return takes no account of passible advantages and proportional revenue which would result on the Jamino and Ea tern Nara sistems, it would appear that the project in north fully investigating, if the Engineers consider it practicable to construct a weir at a cost anything near that at which it has been approximately estimated.

29. This points ta the advisability of first getting a reliable survey of the bottom of the river, but there is no time for this before the Irrigation Cummission meet at Sukkur, and it would help greatly in the solution of questions likely to arise if, while there, the special Commission would discuss the practicability of constructing the weir or dam, assuming that the cross section is even more unfavourable than is shown on the section submitted.

30 Statements showing results of irrigation on the Sukkur, Ghar and Sind Canals are attached for reference.

#### No. III .- MR. J. L. RIEV, I.C.S., Collector of Shikarpur.

Khan Bahadur Pir Baksh, the Deputy Collector of Rohri, to whom I showed the papers, estinantes the increase of revenue in Rohri at half a lake He knaws the country better than I do, but I am inclined to think his estimate rather too liberal. The only canals affected on that side (apurt, of course, from the Nara supply channel) are the Jaaib Wahand Korai. They are small canals, and nothing much is to be expected from them, while I doubt whether any important system of canals is possible. The cost would be prohibitive, and there is not much unbruken ground.

The floods in the fishe would extering to make the made manner.

The floods in the Guhe would certainly be made more certain and of greater volume, and there would be a good deal of rabi. But it is very difficult to give estimates. What would really happen is that there would be more good years in Robri than hitherto.

As regards the Sukkur Division. I attach Mr. MacMunu's letter. Perhaps, he rather under-estimates, or rather, I should say is wrong in making no estimate at all. I doubt, however, whether even with a good supply in the Suid Canal, the extensive lands near the Jehan Wah in northern Nau-habro could be irrigated from that canal.

Ann-hauro could be irrigated from that canal.

The fact is that the principal result of a weir will be to give an early rise, a steady river, and a late fall. Now, when the croys fail, Government only bears an infinitesimal proportion of the general less; so when crops are flourishing, the gain to Government (in rupees) is impreceptible almost compared to the general gain. Ultimately, no doubt, them will be actual pecuniary gain in the shape of higher rates of assument, but at the beginning, when there are no large tracts of virgin soil to be brought under cultivation, an immediate return cannot be counted on.

Not printed.

No. IV.-MB. V. C. MACMUNE, I.C.S., Assistant Collector.

I do not think Mr. Dawson's sohemo is meant to benefit I do not think Mr. Dawson's solume is meant to behelf this division much, and I do not suppose it would do so. There is a good existing supply on all the three canals—Sukkur, Slud, Begari; and the main effect of Mr. Dawson's solume would be, perhaps, the removal of the restriction on the first of these. There is land, as Mr. Giles said, in the Drakhan-Madrji region, also about Ruk; but there is no extended area uncultivated, and uone over which there is an actual look of water with the exception of the strip it was netnal lack of water, with the exception of the strip it was proposed to irrigate by the new Shikarpur Canal and the northern pieces of the Nau-hahro Taluka to the west, which are on the tail of long kurias from the Begari. The Sukkur Canal would, no doubt, benefit from having a really permanent rabi supply, but I cannot put the benefit in figures.

On the whole, I should say that, while this division would profit, the profits would be small compared to that

elsewhere, and would consist principally of all vantages it is difficult to express arithmetically: e.g., the one that would accrue from raising the height of water at the beginning and end of the immedation, and thas making the supply

uniform.
One is forbidden to discuss the practicability of the scheme. But I would like to point out that the district between Mr. Dawson's "proposed line of bands" and the Sukkur-Begari is a very good piece of country—well populated, well enliveded. What is Mr. Dawson going to do with it? If he is going to flood it, he should be told to stop at once. But I suppose he does not mean to flood it. Why a separate supply channel? It was long ago suggested to enlarge the Sukkur Canal and feed the Ghar from it.

No. V .- Mn. H. G. PALLIEER, Chief Engineer, Indus Right Bank Division.

#### A .- SIND CANAL. Acres. 169,000 Culturable area commanded Maximum irrigation estimated by the Exocutive Engineer 24,000 75,000 Area remaining

The estimated "maximum irrigation" is about 66 per cent. of the culturable command, which agrees fairly with the combined Sukkur and Ghar Canals' figures, for which seo B of this Note.

Given a higher supply in the Sind Canal, the Executivo Engineer estimates that one-fourth of the "remaining area of 75,000 acres will be irrigated, or, say, 18,800 acres, which at Rs 3 per acre will give a gross annual revenue of Rs. 56.400.

B.—SUERUR AND GHAR CANALE—	Acres.
Existing culturable area commanded by the two canals	555,000
Of which average irrigation of lost 10 years (up to 1900-01).	
Actual average irrigation equals 58 por	-020,000
cont. of coulturable command.	
Maximum area irrigated in 1894-95	390,000

was Equal to 70 per cent. of the command.

The above "oulturable area commanded" includes the Shahdadpur and the northern portion of the Ratedero Talokas, which are watered by the Sakkar and Ghar Canals with great difficulty and at the expense of heavy silting every year. The contour survey has cenelusively shown that this particular part of the country must be taken over by the re-modelled Begari Canal, which can easily and naturally deliver ample supplies, the Begari water being at a higher level than other that of the Sukkur or the Ghar.

Gpar.					Acres.
Culturable are	a comma	nded	•	•	555,000
Deduct— Culturable are	s which	will	be tra	ns-	
ferred to t	ho re-n	odelle	d Beg	ari	
Canal	•		•	•	135,000
Net culturab			_	•	420,000
Culturable a	irea ava	ilablo	in Gai	ibi	
Dero Jugir Do	do .	Mir	zapur	•	81,000 18,000
Do	40		ou par	•	20,000
Total caltural		o bo co	omman	ded	519,000

Of the 420,000 acres remaining within the Ghar and Sukkur systems, 58 per cent. seems to be actually irrigated. This, if correct, is a very high percentage indeed, and there seems to be no possibility, therefore, of extending irrigation within the limits of the present command.

Thore are, however, 102,000 acres of jngir land which could be brought under command of the (extended) canals. Calculating on the high proportion of 50 per cent, there wend be 50,000 acres of new Irrigation, yielding, say, Its. 50,000 gross anaual revenue to Government in the slupe of Hakabo.

But it must be remembered that the Ghar Canal when re-modelled, after relief of its impossible duties in Shalidadpur and the north, will be quite enpable of watering the jagir country on the west during the klurif season, unassisted by any new Foeder Canal from the lake caused by the Bukkur Weir.

The proposed Feeder Canal would certainly raise the rabi level of the Gher to something like the present kharif level, and would therefore secure the extension of rabi cultivation. But the existing irrigation is already 58 per cent, of the whole cultivable command, and it is difficult to cent. of the whole enturable command, and it is difficult to see how extension of irrigation can be brought about. The only result of increased rabi supplies would practicably be the substitution of rabi for some of the present kharif entiration, and it is doubtful in the first place whether such substitution will be effected by the people to any considerable extent, and in the second place whether such substitution would secure any increased revenue.

In his Note, the Collector of Laskana estimates the annual increase of revenue due to improved sapplies brought down by the proposed Feeder Canal from the Bukkur Weir as under :-

(i) Ratodero Taluko, north	From Rs. 15,000	To Re. 20,000
(ii) Kambar and Nasiraban, do	50,000	70,000
(iii) Larkana do.	18,000	20,000
(iv) Ratodero Taluka, south	15,000	15,000
Total .	83,000	1,05,000

The north Ratedore figures have been excluded from the total, as that land will be taken over by the re-modelled Begani Canal.

The estimate scems a cautions one, and agrees with my general view of the probabilities.

C REVENUE DUE TO BUERUE WEIR-	Rs.
A Sind Canal	56,400
B.—Sukkur and Ghar Canuls.— The Collector osti- mates about	1,00,000
The Gaibi Dero and Mirzapur jugits will bring in Rs. 50,000, but the re-	•
modelled Ghar would water this nrea without assistance	50,000
Total Gross Revenue, say .	2,00,000

Against this must, in fairness, be set the loss of revenue from the land thrown out of onlivation on both banks of the river by the raising of the celd weather river level by the proposed Weir. It is true that such loss of revenue will be allowed for in the Weir project as an indirect charge under "Capitalisation," but none the less the revenue will bo lost to Siod, and most he fairly recked as a set-off against the increased revenue from the Sind, Sukknr, and Ghar Canals systems. What such loss is likely to be, there are at this stage no figures to show.

#### No. VI .- Mr. J. H. E. TUPPER, Collector of Larkana.

- The scheme would affect 4 talakas in the Larkana Collectorate - Ratedere, Kambar, Larkana, and the northern pertion of Nasirabad.
- 3. Improved supply in the Sakkur Canal will affect the northern pertien of Ratodeto Taluka only.
- 4. Improved supply in the Ghar will affoot the southern portion of Ratodoro Talaka, the whole of Kambar and Larkans, and the northern portion of Nasirabad.

- 5. It is apparent, therefore, that the offeet likely to be exercised by the scheme on this district will be practically confined to the new commanded by the Ghar system.
- contined to the new commanded by the Giar system.

  G I may observe, in passing, that the Sukkur Canal shready gives both a kharif and a rabi supply, and that it is, I am told, eapable of giving full supply with Bokkur Esuge at 9 feet, riz, 4 feet under what is usually described as "fair irrigation level" for other canals. In spite of this, the sopply is at present unequal to the demand. It would appear, therefore, that what the Sukkur Canal stands in med of is increased bed width and a larger volome of water, and it is not clear from Mr. Dawson's letter that those remedies form any part of the Bukkur Weir scheme. Without this, the mero raising of the water level at Bukkur to 125 feet all the year round will exercise a comparatively trifling effect upon the canal, so far at least as it affects this district. If the carrying capacity of the caoal can be increased at the same time, and the canal kept working during practically the whole year (as it was last year and is likely to be this year). I should estimate the yearly increase of revenue from the northern portion of the listeder. Taluka at Es. 15,000 to Rs. 20,000, not more, since the waste area in that portion of the taluka capable of being brought noder entiration is limited.

  7. Turning to the Ghar system. The conditions on
- 7. Turning to the Ghar system. The conditions on this canal are widely different from those of the Sakkur. The latter is a "perennial" emal and gires a full supply with a comparatively low river: the Ghar is not a "perennial" canal and can only give full supply with a high river. The Ghar is, therefore, likely to benefit to a far greater extent than the Sakkur by acquisition of a head above the weir commanding a permacent 12-feet supply.
- shove the weir commanding a permacent 12-feet supply.

  8. The mere conversion of the Ghar into a "perennial" canal is not likely of itself to greatly increase the area under cultivation, but if the surface level of water in the canal em he raised some 3 or 4 feet (the hed level remaining the same—this implies a greatly increased volume of water also), the whole system is capable of great development. With the Ghar, the main point would appear to be raising of the surface level. This is all-important, her use the major portion of the waste land available is capable of being brought under cultivation only if it can command a mok" (flow) supply. This land, fur the mest part, contains a hency admixture either of salt or of sand. Such land can be rendered fit for cultivation with comparative case with a plentiful "muk" supply; but if a laft supply unly is available, the task would be an impossible one.
- 9. The land which is locally known us "axil kalimti" and as "wariasi" may be left out of calculation, since it would require a grent number of years and an unlimited supply of water to make it fit for the plough.
- 10. Other varieties of these two descriptions of soil, which contain respectively a smoller admixture of "kalar" and of sand, can be converted into good land with more or less trouble in proportion as the admixture is greater or smaller. The only requisite is a plentiful "nock" supply. The variety known as "kat kalar "especially is capable of being quickly converted into what is known as "dangachi"—an excellent rice soil.

The randy soils, on the other hand, from "drib" down-wards, are expable of conversion (given a "mob" supply) into the description of "latashi" or "latinri," knewn respectively as "gasari" and "drasari"—both excellent light soils, though not soited for rice.

- II. Turning now to the talukas affected. Kambar and Nasirabad both coutain large creas of saltish or sandy soils expable of conversion as above described into arable land—notably Kambar. I should say that the cultivable area of Kambar Taluka is capable, under the conditions described above, of an increase equal to one-quarter of the area at present cultivated, bringing in between Rs. 69,000 and Rs. 70,000 per annum as additional revenue.
- 12. As regards Nasirabid (of which the northern portion only depends on the Ghar), I have some hesitation in expressing an opinion, since it is three years slace I was in charge. I should say that the taluka might be counted on for on increase of from Rs. 30,030 to Rs. 40,003 owing to a greater area under cultivation.
- 18. Larkana Thinks is already very heavily cultivated, and I do not consider it would be safe to speculate on an increased area ender caltivation of more than six or seven thousand serve, representing an increase of, say, Rs. 20,000 in Land revenue.
- 14 The southern half of Batedero, which depends on the Green head, has softered severely of late years, owing

- to the low surface level of the water. With a mouth above the weir, this would be remedied. I do not, however, think that the additional nrea of land which could be given out for cultivation would amount to more than 5.000 acres, representing a revenue of about Rs. 15,000.
- 15. I may possibly have somewhat under-estimated these figures, but I should not myself care to speculate on an increase of more than 14 lakes as the resolt of new land brought under cultivation in this district by the proposed scheme.
- 16. This, of course, does not take into consideration the greater profit that would accrue to the cultivator from land already under cultivation, owing to his being able to calculate upon a certain, instead of n precations, supply. This would doubtless mean ultimate enclamacement of rates, and hence greater revenue from the whole cultivated area on the oanal assems concerned.
- on the canal sistems concerned.

  17. I would notice one more point. Mr. Dawson writes that the wew scheme would render the Ghar practically independent of changes at its mouth. From this, I infer that the existing Ghar and Ford Wah mouths will remain, and that the mouth above the weir is intended to be merely supplementary, and will not be designed to carry the full supply required for the whole canal. If this is so, there cannot, I presume, he may intention of greatly raising the surface level of the water in the canal, since, if this were done, the exiting Ghar and Ford mouths would both be convented into ecoapes. If the surface level is substantially raised, both Ghar and Ford mouths must cesse to exist as feeders. As I have pointed out, my celenlations of increased revenue are based on the assomption that the sorface level of the water in the canal will be raised 3 or 4 feet. If this is not the case, the increase of revenue is not likely to be mere than one-third of what I heve stated.

### No. VII .- MB. H. G. PALLISER, Chief Engineer, Right Bonk Division.

There are no great expansos of what may be called virgin colturable laod in this Divisioo awniting the construction of new canals, such as was the case in the Left Bank Division previous to the commencement of the Jumr. o Canal, and soch as may yet remoin in the Hydernbad and Thar and Parkar Districts. Speaking broadty, all the culturable waste land to the Right Bank Division can be communded and watered by extensions of existing canals. These may be teken separately in geographical order, commencing from the north.

- 1. Desert Canal.—The "re-modelling" of this canal at a cost of about 18. 11,00,000 will, it is hoped, be completed in time for the inundation of 1902. When completed, this canal will, it is believed on present information, reach its full development, and be capable of irrigating the whole of its command without probability of any feasible extension for years to come.
- 2. Unhar Canal.—Beyond extension of distributaries for watering interior command, not much can be done, as the land at the tail comes within the influence of either the Desert or the Begeri Caunl.
- 3. Begari Canal.—It is proposed to entirely "re-model" this canal and to extend the tail distributaries so us to irrigate the Shahdadaur und parts of the Raiodero Tolukus, which have hitherto suffered from inadequate supplies from the Sukkur and Ghar Canals. The Begari will deliver higher water than either of these two eausis, which take off much further down the river.
- It is also proposed in the "re-modelling" scheme to investigate the possibility of taking in a larger partion of the Khelat territory for irrigation seross the border near Khairo Garhi.

Sorreys are proceeding, and will, it is hoped, be completed this next season.

- 4. Proposed Shikarpur Canal is an alternative to the widening and extension of the Begari Canal, the merits of the twn proposals being judged on the results of the zurveys now in hund.
- 5. Mahi Canal (on the left bank of the river, but included in the Hight Bank Division) will be completed next season at a cost of about Rs. 7,60,000. When completed, it will probably be found that there is a good deal of land at the tails of the Delra, and of the other distributaries of the new Mahi Wah, which could be brought under command by extensious. This would involve a fresh sarvey and a new estimate, and can be seen to next season.
- 6. Sind Canal.—No extension is possible, beyond that of the distributaries, as the tail country enture within the sphere of either the Begari or the Sukkur Canal.

- 7. Sukkur Canal.—Some of the country at the tail, at present watered with difficulty, and at the expense of much silting, will be taken ever by the re-modelled Begari. This will relieve the Sukkur, and enable it to extend its sphere of usefulness in the southern direction, thus in turn relieving the Ghar.
- 8. Ghar Canal is proposed to be entirely "re-medelled," and the preliminary contour survey was commenced last season and will, it is heped, be completed by next hot weather. The Shahdadpur country in the north-west will be taken over by the Degari Canal, which delivers water there at a higher level, and the Ghar will then be fitted to carry out its full legitimate duties to the southwards, where the water-supply is under present conditions defective. Extensions will also be worked out so as to include the Jaibi Dero and the Mirzapur jagirs, situated in the west, under the hills, and littlerto not served by any irrigation system. The culturable area of these jugirs is believed to be about 100,000 acres.
- 9. Western Nara,—Complaints have been rife for many years past of the unsatisfactory working of this great cause, and proposals have from time to time been made for partial improvements, some of which have been carried out in fairly recent times. But experience does not encourage the continuance of such patch-work, and it is now proposed to institute an exhaustive enquiry into the whole system of irrigation, commencing with the indispensable contour survey, to show how the lords of the land his everywhere, and then to proceed cautiously and scientifically with a complete scheme for re-modelling. A history of the canal has just been prepared, and an estimate for the contour survey is being submitted for the sanction of Government.

There are large areas within the system which receive no supply of water at all, and others with a defective supply. There is no question of extension, but of construction of now branches and re-arrangement of old ones, so as to make a complete and homogeneous system of the whole Western Nara irrigation, from the mouth near Larkana down to the Mauchar Lake and Schwau.

10. Karachi Canals.—From Soliwan to Kotri, the strip of culturable land between the river and the hills is narrow and there is no scope for any but very small extensions.

Below Jerruck, the country opens out into the deltnic formation, and both banks of the river are included in the Right Bank Division.

On the loft bank, enquiries are proceeding for extensions of two small canals (Laikpur and Ali Bahar) near the Pinysri, which will bring, perhaps, 10,000 acres into cultivation. Further south, near Sujawal, there is a proposal for a new small canal (called Gaugri Chalatbo) which will take in about 12,000 acres of waste land; and still a little further south it is proposed to extend the Satah Canal to irrigate 6,000 acres of new land, as well as to improve the supply to existing cultivation.

On the right bank of the river, there are no actual proposals us yet for extensions, but it is thought that there will be no difficulty in bringing a few thousand acres of fresh land into cultivation.

11. The order in which the above schomes may be considered is very much the order in which they have been enumerated, except that the small projects in the Karachi Canals District can be worked up simultaneously with, but of course independently of, the larger schemes of Upper Sind.

#### Statements laid before the Commission by the Commissioner in Sind.

Reie.-Blee-la Shikarpur, the experiment was conducted on Segasti and in They and Parker on Beirio rice in 1597-88.

WITNESS No. 1 .- ME. E. F. DAWSON, Superintending Engineer, Indus Lest Bank Division.

- 1. Q. (The President)—I understand, Mr. Dawson, you are the Chief Engineer, Right Bank of this canal?—No. At present I am Superintending Engineer, Indus Left Bank Dirision, acting for Mr. Dunn, who is absent.
- 2. Q How long have you been connected with these works?—I have served as Executive Engineer, Sind, 43 years and as Engineer and Secretary, Indus River Commission, for 9 months.
- S. Q. I suppose there is no question of famine relief works?—I think not. Last year there was a threatened scarcity caused by people coming in from Cutch.
  - 4. Q. You never consider it necessary to keep up a programme of relief works?—Such is never called for. We only open so-called famine works to meet the requirements of people coming in from Kutch.

- Mr. Dawson. 5. Q. The point that concern us in the Irrigation Commission is to enquire how the irrigation system can be 5 Nov 1901 improved so and to the various food supplies required for the country. We should like your opinion on this?

  — My information is based on the replies given to the written questions already asked. To begin with, what strikes me is the very large area of land that is cultivable but is not cultivated or assessed, 700 square miles I suppose you understand we have in Siad a system of fallows. you understand we have in Siad a system of fallows.
  - 6. Q. Will you explain this system P.—We are supposed to allow for three years' fallow and one year's caltivation. The area commanded is therefore four times at least the nrea that will be cultivated nnunally. In some ground crops are grown year after year, but ordinarily there is three years fallow, and the revenue settlement provides for only that, calculating one-third of the area as assess-
  - . 7. Q. You deliberately provide for only irrigating each year 3 of the area ?-Yos, the land won't stand irrigation every year.
  - 8.  $\hat{Q}$ . If ad you occasion to go into that ?—No, we have statistics but our projects provide for irrigating only  $\frac{1}{2}$ .
  - 9. Q. As the result of your ebservations, doce it appear a reasonable thing to reserve such a large amount of fallow?

    —Yes, in the present condition of the people.
  - 10 Q. I sappose there is no restriction. They may enlivate the whole area P—Yes. Land is assessed as lift or flow, but a man is not allowed to convert lift late flow without permission.
  - 11. Q. Can you tell me approximately the relative nrea of kharif and tabi?—I can't give it to you otherwise than in n blue book.
  - 12. Q I suppose the "lift" is rabi. You give in statement "C" the total area cultivated. I suppose the wheat crop represents the rabi P-Not altogether. We have a large area of Jhamba and other oil seeds.
  - 13. Q. As far as water is concerned, putting aside lands under fallow, I suppose there is plenty of water for increasing the sabi caltivation ?—No, not in our causis.
  - 14 Q. In the river?—Yes, there is ample water. We have measured 34,000 cubic feet a second. That would inhave measured 31,000 cubic tects second. That would increase as the river rises, but it is on too low a level to be utilized in estals. We are exercising the beds of some of the canals to give a supply at what is called the fair irrigating level. We speak of 13 feet on Bukkur as being a fair working level and it corresponds to 17 feet at Kotri. It would not pay us to deepen some canals became they would become silted early in the season. Certain of our canals are vory good rabi ones.
  - 15. Q. You mean it would not pay at the present assessment rates ?—It would probably disturb our system altogether to irrusate specially for rabi.
  - 16. Q. What is, roughly speaking, the bed slope of canals?—Usually 5" to 1' per mile,—sometimes vil, the surface slope is then given by the rise of river.
  - . 17. Q What is the slope of the country?—Near the river itself it is running inland sloping 9 inches to a foot and thea reduces to 4 inches per mile.
    - 18. Q. Sloping away from the river ?-Yes.
  - 19. Q. I find in one of the papers the remark that "well irrigation need hardly be noticed—27,000 acres P"—Yes, the statement is given, but I think the Revenue Department had better explain how it is classified. I think it is due to our cannis, by the water level being raised, but it has hone classified as wells and not under cannis. it has been classified as wells and not under canals.
    - 20. Q. But still the wells are very largely used P-Yes.
  - 21. Q. What abant is the depth of spring level?—Perhaps a little back from the river face we should find water in a few feet. It follows the ground level.
  - 22. Q. What is about the outside the cultivators have to raise water?—Ordinarily ten to twelve feet. But in Hydenabad our canals get very little flow, the irrigation is all lift and the wells are deeper, down to 50 feet I think. Outside the onnal tracts they have deep wells up to 90
  - 23. Q. Even where they are only 10 feet below the surface would cultivators prefer canal water :— I really don't know. I think they would if they got flow. We have certain restrictions on the description of cultivation to be grown. We might not allow them to grow rice on such lands.

- 24. Q. Then there is a restriction on rice?—Yes. Owing to the larger quantity of water it requires.
- 25. Q. Do the oultivators apply to the Collector for pormission to grow rice?—Yes, to the Assistant Collector, who passes it un to the Engineer concerned.
- 26. Q. Is the silt which comes into your canals fertilizing of sorts ?—I think not appreciably. If it puts merely a skin on the ground the people undoubtedly praise it, but I find if eilt is brought by flood it eften gives trouble.
- 27. Q. Have you both large and small inundation canals ? Yes.
- 28. Q. Are the small ones private property?—No. Practically all the causals in Sind are in Government charge. There are a few private ones and they are gradually being
- 29. Q. Are those in Government charge under the Irrigation Department?—Yes.
  - 30. Q. You are responsible for clearance !- Yes.
- 31. Q. What are about the maximum and minimam levels on the Bukknr and Kotri gauges?—We mark every year on a diagram the average of ten years. This diagram shows the heights. It starts in the month of January. Our present average height is about 5' on Bukkur.
- 32. Q. That is the minimum ?-No. Two feet below
- 33. Q. What is the average P-About zero.
- 33. Q. What is the average ?—About zero.

  34. Q. What does it rise to ?—Starting at zoro it just touches the foot and then on to 1½ in February, thea to 4. At the end of Maroh, and at the beginning of April it rises to 5′. At the end of May it reaches 6′9. We get a temporary rise in the middle of May. This year it went to an enormous height. At Dena Ghazi Khan it reached a maximum record. From the 1st June it rises to 11½ at the end of June. Even on the 10th July it reaches 12½ and it stands at that height until the end of August. The faul height it may reach varies from about 12′ to 17.9′. The minimum I have not here.

  35. Q. Thun there are varietions of at least 6 th have not
- 35. Q. Then there are variations of at least 6 ft. between the maximum in one year and the maximum of another? We generally approach 13.
- 36. Q. Then it might be as low as 12 and it might be as high as 16 ?-Yes.
- 37. Q. You are ongaged on the Indus Survey?—Yes, We are doing what we can.
- 38. Q. Do you go further up than your own province?
- 39. Q. Would not that be necessary ?-No. If we think there has been crosion of the liver fuce we survey the river for a few miles above and below and leave on record possibilities of future movements. We are also measuring discharges.
- 40. Q. And taking cross sections?-Yes, depths, cross sections and velocity measurements.
- 41. Q. In your answer to question 5 " aroas of irrigation, etc.," you give a table. It gives altogether the areas commanded 44,000 acres, besides which I gather there are 150,000 acres which may possibly be irrigated by proposed canals P-Yes.
- 42. Q These are extensions which might be made to the canale?—Yes.
- 43. Q. Do you think that you will add nearly I million acres?—Yes.
- 44. Q. This million acres, what is it going to cost? How many laking of rupees?—Possibly 45 lakins or 50. I have not got estimated figures. I am not familiar with these figures because I have only had charge of the Division for a short time.
- 45. Q. Then you say 10 lakbs of irrigation for 50 lakhs. of ropees 9-Yes, I think that would be a fair estimate.
- of ropees?—1es, I think that would be a lar estimate.

  46. Q. According to the present system, in may year you would irrigate a third or fourth of that?—I believe that is right. I am not sure of the figures. It may only be a third that we expect taget out of that.

  47. Q. Have you had experience of land that seems to be injured by salt or red?—I have bad experience of it. I prefer not to mentica any opinion on the subject. At Karachi wogst rice, but a poor description requiring a large amount of water. amount of water.
- 18. Q. To come back to private canals, are they the property of single individuals or communities P-I think of single individuals.

- 49. Q. I understand there is a very large area here under jagir?-Yes.
- 50. Q. Are these the men who make private canals?
- 51. Q. As regards making new canals would you make any difference where it is jagir land?—Yes, because we only get a hakabo rate. It may be 8 oo aas an acre.
  - 52. Q. Would you avoid such lands?-Yes.
- 68 Q. On the other hand, I suppose many of the jogir-dois get capals by toknyi? Yes, I think so.
- 51. Q. It is a boon giving them free water?-Yes, that is what it comes to.
- 55. Q. Is there any irrigation in Sind dono from mountain torrents in the west?-Very little; they bind up suall streams.
- 5d. Q. You are in favour of construsting a weir at Bukkur! Yes, but more information is required before I can come to a final decision. Until I came to answer cortain questions put by Mr Higham we had nothing at all prepared regarding this scheme.
- 57. Q. You estimate the cost of 100 lakhs?—Yes, that includes interest.
- 58. Q. Have you say real doubt on the subject as to where the site of the weir should be. Must it be above Sukkur :—Yis; there is no other point where it could be except at thermek. That project was examined very enceful; with a vi w to taking an irrigation canal to Karachi, bot ufter examination, it was considered that it would yield
- 59. Q. When you say no sites what do you mean ?—No suitable foundations.
- 60. Q. Do you think there is practically no site elsewhere !-- No.
- 61. Q. (Mr. Higham)—The statement you have given us shows about ten thousand square miles in Sind that are irrigable but at present not provided for by irrigation?—I have not got that staloment. I have not seen it.
- 62. Q Have you any idea whot the area is that remaios to be taken np?—No. I have no idea.
- 63. Q. The cultientle area is 13 million acres of which you irrigate 23 million acres u year !—Yes.
- 64. Q. Aro you supposed to Irrigate one-third of the area commanded ?—Yes, we are, however, doing very much more than that on some canals.

  65. Q. On a broad average you Irrigate that ?—Yes, that is what it practically omounts to.
- 66, Q. Of 7½ million seres commonded you irrigate 2½ million seres, that leves obout 5 millions Yes, but I don't know what the 6 million seres mean. It may Include all sorts of land.
- 67. Q. Whot would be the result of constructing o weir and raising the level of supply to the canals on the right and left bank and giving a perenuial sopply? What additional area would it enable you to bring under cultivation. What would it pot on the right bank i—I estimate that oa the average we might expect murty 4 lakks of rupers.
- 69. Q. I am talking about areas; whot would be the iditious area of cultivation?—Aboat 120,000 occus on the right bank.
- 69. Q. That would be new enlivation !- Altogether new cultivation on lands which don't get water now except on rare ocessions of flood.
- 70. Q. Multiply that by 3, the actual portion under commend, that is, 300,000 acres, and you would improve the conditions of supply to the existing cultivation?—It would render the existing outlivation permanent and secure.
- 71. Q Wint additional area would you take up on the left bank?—I don't know what the figure is, but Mr. Joyner sais 300,000 acres practically would be brought under cultivation.
- 72 Q. The greater part of the left bank is in foreign territory f-Yes, Bahawalpar and Hyderatad.
- 73 Q. Would the land in Bahawalpur be under com-mand !-It will be practically "flow" instead of "lift."
- 74. Q. I think on the left bank of the river the present irrigation is chiefly "lift?"—Yes.
- 75 Q. If you make the weir it would be flow ?- Yes.
- 76. Q. What is the difference in the rates of flow and lift irrigation !-I think the rate would run Rs. 2-1-0 for

- lift and Rs. 3 for flow, bot a smoller quantity of water Mr. Dimena.
- 77. Q. Would it only cost 12 annas to lift the water? 5 Nov. 1901. Mr. Joyner estimates it would cost 12 times that.
- 78. Q. If you give flow irrigation although the reconna-would not increase much the cultivator would benefit?—
- 79. Q. (Mr. Higham.)—Is there not a large area in the Hyderobad tabel not irrigited at all ?—Yes.
- 60. Q (The President.)—There is plenty of room for extension of irrigation in Sind !—Yes.
- 81. Q. If the weir is made at all you will take full value out of it ?-I think so.
- S2. Q. (Mr. Higham).—Is there any reason to suppose that the withdrawal of supplies from the Ponjah will injuriously affect the sapply in the Indaa canals ?—In my opinion none at present, because of the cold weather discharges. All that we require us for the Nara and the Pholleli and those which have cold weather irrigation. I don't think it can have any effect. The Punjah canals only take 20,000 with fact. cubic feet.
- S3. Q. What is the minimum discharge of the river?-Last year we measured 35,000 cases. The measurements we have only had for the last two years and the duschargu does not necessarily vary with the gougo.
- 81 Q. That 35,000 was measured at Kotri and the same at Sukkur?—Yes, nothing goes off between.
- E5. Q. That is exclosive of what is passing down the Nari, how much does that take ?—Probably not more than 2,000 n occord at this season of the year.
  - 86, Q. It is immaterial ?-Yes.
- 87. Q. If we take another 10,000 onsecs off in the Paciab would not that effect this discharge ?-It might affect our supply slightly.
- SS. Q. When do you open?-Between the midulo ond end of Mny.
- 89. Q. What would your supply rise to in May?—I have shown we get 100,000 per second with a gauge of 0' on Bokkur. A withdrawal of 5,000 cusecs would not have any effect at all.
- 90. Q. Then the proposal for a weir is not with the object of preventing the retrogression of the Sind canals owing to the withdrawal of water in the Punjab !—No, the weir is regoired to ensure command and extend cultivation in Sind.
  At present it we wish to make extensions we must deepen
  the 'take off' of our canols.
- 91. Q. With your weir you will get an increase in the corface slope?—Yes.
- 92. Q. And therefore a less deposit of silt?-Yes, in the Nari not in the canal.
- 93. Q. That would only extend a short distance because you get on notural levels again. So from consideration of this subject you think you chould build a canal at Sakkor for a crose of ropees P—Yes, if it is practicable
- 94. Q. What woold be the advantages of it. It is un-necessary, I understand, to prevent the present canals falling back?—No, it would canvert the Sukkay and Ghay into percental canals. We would then know moves for efficient cultivation. We might have a large tract on the left bank at Hyderabad. The combined revenue from these improve-ments would unquestionably give us a return of mora than \$\frac{\psi\_{\text{total}} \text{ result} \tex 6 to 8 per cent. on expital rost.
- 95. Q. Assuming tha cost would be a crore?—Yes. Then we would be owed all the trouble and accessity far surveys at the months of the Ghar and Sukkur which limit the orea on account of the ancertainty of the oupply, and we would also provide for extensions a great deal more than is praidle at present. Opening up the Hyderabad area would be an enormous improvement.
- 96. Q. The supply would be much more constant!Yes, it would be permanent in a sense.
- D7. Q. That would lead to an increase of assessment !-Yes, finally.
- 98. Q. In the meanwhile the average sapply would be brought up to the level of the maximum. —I think so unquestionably. The real difficulty is construction, which involves measure work with compressed air at a depth of 40 fee, and provision of slokes.

Mr. Dawson. 99. Q. Might you not divert the river from one side to the other?—I think not. That is my present impression. 5 Nov. 1901. It would be a magnificant work if it could be earried out.

- 100. Q. Are none of the canals supplied with distributories?—Yes, they have branches.
- 101. Q. What is the length, provided P-I could not newer. We have long distributories. Down in Korachi thoy have very small distributaries.
  - 102. Q. The water courses belong to the villoges ?-Yes.
- 103. Q. What length; how many miles !—I oan't give you the figures. I have not leoked at them for years.
- 104. Q. (Mr. Hibetsen).—Do your canals ever fail in drought?—We have sesseities.
- 105. Q. Within your experience to what would that scaroity amount, what propartian would the contracted cultivation hear to the area of oreps ordinarily matured?—It might be 1 in bod years.
- 106. Q. That is a maximum?-Yes, and that would be only on specially bad canals that had something wrong with their mouths.
- 107. Q. Is very much damage done by water-logg-ig?—There has been, but practically none since the eming?-There has been, hankments wore made.
- 108. Q. Have not drainage works been excented?-We have spent a prere of rapees on the Jameno. On that systom they have a drainago system as part of the project.
- 109. Q. Do you think that drainage is required?-I think so in certain tructs.
- 110. Q. Has compensation ever been given within your experience for the damage dons !- Never.
- 111. Q. Don't you think it would he right to give compensation when you injure a small truet for the benefit of an
  immense anmber?—I think it is the fault of the cultivator
  taking too much water in order to give full benefit of the silt for rice enliration.
  - 112. Q. What form does the injury take ?-Marsbes, etc.
- 118. Q Does tho health of the people suffer seriously ?-Fever is a result.
- 114. Q. Are the remissions considerable?—In some
- 115. Q. What proportion of revenue is given?-Wo have flood remissions and remissions for shortage of water. The latter is given on the examination of the reveaue official and a villago punch; so much by the aggregate outturn on the area concerned.
- 116. Q. If you get a four-anna crop, you would not charge half rate?—No.
- 117. Q. The assessment is made by the village punch?-
- 118. Q. You have nothing to say to that? Do you think that the remissions are liberal?—Yes, very liberal.
- 119. Q. What credit, direct or indirect, is made to your anals?—The whole revenue realised on the area of irrigated land, after deducting, I think, o per cent. for collection.
- 120. Q. The assessment is levied only on land sewn, is it not?—Yes, but it is compulsory to cultivate each field periodically. A man has to pay his assessment if he does not.
- 121. Q. How far are the Sind canals provincialised ?-They are all Imperial.
- 122. Q. Does the Provincial Government get no share at all of the Revenue ?—I think none.
- 123. Q. Do you experience any difficulty in getting money to extend canals?—There was some difficulty a few

- yoars ago, but lately we have been treated very well. At present there is a difficulty in getting finds for works classed uader 43 instead of 49.
- 124. Q That is extensions and improvements to existing
- 124. Q That is extensions and improvements to existing canals and extending ethers?—Yes, we have such projects as the Hasanali. We may be able to epare measer for 49, we have a difficulty to get it for 45.

  125. Q. We are told that you have some tea thousand square males of land anirrigable but irrigated. Your statement shows that \$\frac{3}{2}\$ of the cultivable land is irrigated and that \$\frac{1}{2}\$ is lying fallow. You told us also that you have schemes which would add materially to the area irrigated, and that large extensions are possible?—Yes.
- 126. Q. During the past 13 years there has been next to no increase in cultivation and next to no increase in irrigation. (Witness produced statement to explain.)
- 127. Q. Within the last 11 years have there been any large extensions?—Not very mach. We have constructed a large number of works, which have, however, not yet begun to show results. The next few years ought to show a considerable increase. We have also secured stability of irrigation; the annual area fluctuates much less than fermerly.
- 128. Q. Suppose you had unlimited money could you extend irrigating practically to an unlimited extent.—No, to an unlimited extent. We should have to bring in labour from outside.
  - 129. Q. You are doing that?-Yes.
- 130. Q. Yon say that a good many of the existing oanals were made originally by the people, and that the private casals have been gradually absorbed. Has the process gene on in your own experience ?- Yes, we have cases.
- 131. Q. Why has it been necessary to absorb them ?— Owing to the neglect of the owners who had become bonkrupt the lands fell out of cultivation and the people themselves appealed to Government to take the canols over.
- 132 Q. Has the oristence of private rights in ennals impeded progress on Government canals?—Yes. But not appreciably.
- 133. Q. In a tract where Government is not prepared to extend irrigation within the next 20 years, would it not be a good thing to stimulate the construction of private canuls?—We have very few tracts in which to give out rights for private canuls, There is little room for them.
- 131. Q. Has there been any treuble on priento canals in the recovery of dnes?-1 den't know.
- 135. Q. Do you charge any royalty on private canals for the water ?—I don't know. They are mostly ou jagir
- 136. Q. Do you know what the owners of the private earnly take from enlituators as water-rate?—No. I think it is a charo of the crep.
- 137. Q. Have you may experience of the working of the statute labour system ?— I have had a few such canals in my change, and it is thought unsatisfactory. Some men do not do their share.
- 138. Q. If the men don't finish their share of work it has been necessary to take it over ?—Yes.
- 139. Q. Is it not the onse in Sind that canal water is only used to start the rabl which is neatured by the wells?—I den't think that is the case here although it may be to some slight extent on porticulor tracts.
- 140. Q. Have you any knowledge of tracts which are irrigated from wells without cannt water—that are independent of wells?-No.

WITNESS 2 .- MB. T. SULLERS, Superintending Engineer, Indus Right Bank Division.

Mr Summers. 5 Nov. 01.

- 1. Q. (The President.)—I understand you are seting as Superinteoding Engioeer f.—Yes, of the Right Baak.
- 2. Q. The part you know hest is the left bank ?-Yes.
- 3. Q. We wish to ask you about the left hank. How many years bave you besa in Siad ?—Ten yeare.
- 4. Q. What is your opinion about the extension of rahi irrigation? Do you think it should be encouraged?—Yos, decidedly.
- 5. Q. Woold you do it by converting the present inundation causes into personnal caoals?—Yes, as far as possible.
- 6. Q. We were told just now by Mr. Dawson that if we increase the number of peronnial cannis there will be tremendeus increase in the amount of silt? De you share that opinion?—These large pereanial canals don't silt, they seem out, at any rate this is the ease with the Fulcii ceaal.
- 7. Q. 1 gather from what Mr. Dawson says, at all times in the year there is a silt donesin f—There was in the last five miles only of the Fulcit; before the escape was opened in 1899, new there is none. It scenrs ent above?
- 8. Q. What is your greatest slope ?-33 inches a mile is the bed slope of the Fulcli.

Mr. Summers.

- 9. Q. Have you experienced any other canal excepting the Fuldi ?- Same of the large branches of the Fuldi with discharges up to 1,600 casees dun't silt at all.
- 10. Q. I surpress where silt does exist, it is near the canal heads?—Yes, of the branches. They all silt except some large ones, which don't oilt at all except at their tails, when there are no escapes.
- 11. Q. And is this silt clear mon a costly business ?— Yes, about a lakh and a quarter for the Enlelt: it used to be 14 lakhs: it is greatly reduced.
- 12. Q. I suppose clearance of silt is all doos by minual
- 13 Q I indeestand the Puleli Canal was an inendation canal oad son made it into a percential canal. Was there any difficulty with the cultivators?—No. They took to it at once. They get flow in the cold season in the lower reaches. The result of making the Fuleli percential, at a cost of only 2 lakes of rapees, has been to provide a cold-washer supply of about 1,200 cubic feet per see, which will certually bring in an extra revenue of several lakes.
- 11. Q. And you command the countre well ?—Ves. In the lower portion of the Fulch for about 40 miles, the land is 'ow, b it in the upper half the land is high.
- 15 Q. Is there are passibility that a weir bullt at Sukkur woold affect it?—If no extra 4,000 is taken off it would affect the depth of the Indus by about 9 inches to a foot, If it is running 50,000 cubic feet per second.
- 16. Q. How far is the head of the Fulch below Sukkur? I could not eas. (This was accounted from the map and put at 300 miles.)
- 17. Q. Have you had any occasion to question this ration of having three years fallow to one years erop? system of harl No, not at all.
- 19. (Q. Mr. Ibbetson.)—Do you think that lurning the exacts into percautal counts will do not with the accessity of follow?—No.
- 20. Q You do it agree with Mr. Pallicer that if the rabi is increased it will be at the expense of the nutumn eron ?-No.
- 21. Q Are you getting near your limit?-No, about 4th of the cultivable area is onlivered.
- . 22 Q. The increase of irrigation on the Fulcil le 80,000 · 22 Q. The increase of irrigation on the Fulcil le \$0,000 acres in the ten peurs ending 1900-1001. Is that increase due to a reduction of fallow area?—It is principally awing to the duty of water being increased from about 49 to between 50 and 60 acres per enbio faut per second of discharge by putting a stop to waste and distributing the water by rotation. Most of the outtration on the Fulcil is rice.
- 23. Q. Are further extensions possible?—Witness explained his project for the new lineasin Ali Canal, for a second escape nu.] for farther improving the irrization of the Fulci Cival. He said that encouragement of bear traffic was very important. The cost of camel can large to the people in the Budin taluka used to be I lakh n year. Now that the grain and rice is carried by boats it is only 1115,030
- 21. Q. How much moury has been spent on the Fulcli?— Live than a lakh a year—gerhaps 5 lakbs allogether during the last ten years.
- 25. Q. And by how many acres did the irrigation in-erere i-siy 80,003.
- 26. Q. That comes in 6 enpers on acro? -- Yes, and with little more expenditure. We have not got to the limit of distribution. We woul distributory chancols?
- 27. Q. How far do you irriga's from your canal by pairate nator-courses ?- Therois a private one 40 miles long. 23. Q. How lar do the villages take the water from
- the canni ?-Perhaps 3 or 4 miles 23. Q. Yan would alter that by making distributory cl. nucl. ?-Yes, and masonry outlets.
- 30 Q. Does any part of your work take you into the villages 2-Not much. We are fully engaged in carrying works, distributing unter, and stopping works and have little time to think about crops.
- 31. Q. Do you do the rotations?-Yes, it is all done by
- 32. Q. Does the system work well du you think ?- Yes.
- 34. Q. There is no clashing of nuthority between the canal officer and the revenue officer i-Not in rotation;

- they help in that. It is only in waste of water that I have had any clashing. The fines not less small.
- 31. Q. Is there much still on your estimates to he spent on the Fuld! ?—The Hearn Ali Wah is a sanctioned project and the second escape is mother one, which will cost 4 lokes of rupees.
- 35. Q. Suppasing a weir coold be built to suit the Fuleli and other caush, du you consider it a desirable thing to have it? I dua't think it would pay.
- 36. Q. You don't see any argent need of it?-No, because if we improve the canal system we have now we can irrigate all we want. (Described on map.)
- 37. Q. I think you hard the questions I put to Mr. Dawson. Did mything occur to you on which you would be inclined to express a different opinion?—Na, except that the Fulcil escape is really a drainage causi. The whole of this country need to be absolutely water-logged and the people used to take their cattle away to the high lands. Those 'dhunds' (depressions) are non furned into the finest cultivation.
- 83. Q. What caoses do you think have kept back irriga-tional progress in Sind?—Perhaps too much work for the engineers to do.
  - 39 Q Insufficient atnff ?- Tes.
- 40. Q. Have you had any experiences of private cannis?

  -Yes. There is one of the largest private canals in India from toe Fulcii.
- 41 Q Ifon does it work ? Vary well-I believe. The owner irrigates more than he is allowed by his caned.
- 42. Q. Yan refer to a private canal from the Fulcli ?-
- 43 Q. Does the owner use the white water himself or does he give the water to others?—Does he sell water to others? Ho uses nost of the water fur his own hand. Inst within a week or two before leaving the district I locked lato his sanad and found he was taking more, weter than he was allowed.
- 41. Q. It is a jugir ?-Yes, a single owner.
- 45. Q. Have you ony other experiences of private anals? There are several smeller mass
- 46. Q .- Of private owners P-Yee.
- 47. Q. Would you etimulote the making of private usls?—I don't think it would work. Private canals are often given up.
- 49. Q. hey don't us n rule arrigate successfully P-No.
- 49. Q. Still admitting full that, in a truct where Gor-ernment is not prepared to extend irrigation would it not be a good thought to have those private causes?—Yes; they do more good than barm.
  - 50. Q. You would encourage them ?-Yes.
- 51. Q There is scope for that ?-Yee, a little scope.
- 52. Q (Mr. Higham) Has your experience been confined to the Faleli Canni ?- Entirely.
- 53. Q. Nat on coy other ?-No.
- 64 Q. How many yearn?-Ten years.
- 55. Q. Is the Pololi entirely different from the others in respect of the surface slope?—It's average ourface slope is 43 inches a mile.
- 56. Q. It's bed slope is only 33 inches a mile?-Yes.
- 57. Q (The President.)—What is the disclarge?— 10,000 enhis feet per second is the maximum discherge, 7,000 the average.
- 58. Q. (Mr. Higham.) What ore the improvements made in the Fukli. ( treeribed an map. )
- 59. Q. 14 the burden on the cultirators in clearing their rater-courses very considerable?—No, I don't think no.
- 60 Q. Clearing the silt from the water-cour-es?-No, I think it is quite easy for them. They do it in a for weeks.
- Oi. Q. Are there not further improvements proposed ?— Constructing distributuries will cost many lakis of rupees. There are thousands of water-courses, all with hacheha mau(h4,
- 62. Q. Have you olways been able to get hold of money you wanted for improving? How much do you spend a year?—Nearly & lakb a year.
- C3. Q. Do you mean on new works ?-Yes.
- 61. Q. Half a lakh a year for improvements f-Yes that is about the arcsoge.

Mr Summers. 5 Nov. 01.

- 65. Q. You know nothing about private canals taking off from the river ?—Very little,
- 66. Q If private awners are allowed to take causla away without restriction are they not likely to interfere with the Government canale?—They will come in the way of our new canals.
- 67. Q. Is there not danger from that ?—There might. If we make this new Hasausli Canal very few, if any will come in the way.
  - 68. Q Da they often make new canals ?- Hardly over.
- 69. Q. (Mr. Rajaratna Mdlr.)—You just taild us that owing to certain improvements made on aertain canals a private owner has benefited very largely. When were those improvements carried out P—Some years ago one of them and the private owner will benefit still further, later on.
- 70. Q. To what extent has be benefited? Can you give a rough idea?—He gete a batter supply because the water level is raised in the Fulcli.
- 71. Q. In the increase of area of enlitivation or bow has he heacfited ?. Has the area increased ?-Yes, the area or cultivation has increased.

- 72. Q. Is the canal officer responsible for messenting the area ?—The Revenue Department anly.
- 73. Q. Was the fact brought to the Revenue authorities notice that he has benefited by it? How data the Ravenne Department know ?—As far as I recollect, I wrate to them about the oultivation. It is an important question. If he is going beyond his sanad, he should pay a large assess-
- 74. Q. You referred to some wanting of water. How is it wasted !—Flanding jungle or wasta had.
- 75. Q. What is their abject in doing that?—They may get little patches of grass to grow or it may he simply carelessaess. For inetance, can of the Municipal Commissionere told me that they had to carry the water-courses neross low ground and had to bank them np. Cattle walked across them and knocked them down and flooded the fields, for which he said, they shalld not be held responsible, and, similarly they have been accustomed to wasting much water.
- 76. Q. (The President.)—Is there any particular fine for this ?—No, but I think they should pay the fall rates of assessment for unauthorized cultivation in suob cases.

#### WITNESS No 3.—Me. F. Sr. G. Genbie, Executive Engineer, Jameso Canal.

Mr. Gebbie.

1

- 1. Q (The President.)—I undarstand, Mr Gobbie, you re Executive Engineer of the Jamrao Canal?—Yes, 5 Nov. 01. northern section.
  - 2. Q. That is on the right bank?-Na; left bank.
  - 3. Q. Tho Jemrao is the newest project you have ?—Yes, it has any heen campleted two years.
  - 4. Q. You were there from the first? Practically from
    - 5. Q. Is it perennial? Yes.
    - 6. Q. It is a branch of the Eastern Nara river ?-Yee.
    - 7. Q. And has it a masonry head ?-Yes.
  - 8. Q. What volume of water does it supply ?-About 3,000 cubic feat per second.
  - 9. Q. What Is your longitudinal slope !- From the head to the fall it is 1 in 5,000 and after that 61 inobes per mile.
  - 10. Q. Do you find the silt clearance a serious difficulty? -No, we have bad no trouble.
  - 11. Q. Is the Jamrao an entirely new canal?-Eatiroly
  - 12. Q. How did the country do before; was there no cultivation?—There was a little cultivation.
  - 13. Q. The offcot of this Jamrao Caual has been to bring a large area under oultivation which abould go on increasing f-Yes, up to a certain limit.
  - 14. Q. Woold you explain to ue the system of coloniza-tion an this canal?—Only a few villages on the Dim Minor have been colonized. In these there are about 1,600 Pan-jabis, chiefly from Jullundur and Gurdaepur. At first many

of these men were very discantented and wished to return to the Panjab to try and get laud on the Jhslum Canal; but the excellent results of the past kharif season have altered their views. The rest of tha laud in the northern altered their views. The rest of the land in the northern district is cultivated by the original owners, who have some difficulty in getting sufficient labour; but this is gradually coming in from Cutch, Marwar, and Guzerat.

- 15. Q. Havo you much difficulty in getting money for these projects?—I don't think there was much for the
- 16. Q. Do you knaw anything about 75,000 acres to he brought under the Ghar Canal !—No.
- 17. Q. Who has been working it np?-Two Executive Engineers, Mr. Wright and Mr. Karpur.
- 18. Q. Did you get out any proposals with regard to the improvement?—There were no proposals made except to europly the Ghar from the Sakkur. The natural levels are, against it.
- 19. Q. Do you know what the supply is in the Eastern Nara. It varies with the inundation. It is about 21,000 online feet per second at the top of the inundation. At presout it will be 8,000.
- 20 Q. And is it all the water they want?—That is all the water they want in the Jamrac.
- 21. Q. Ara there any further extensiane ?-In the
- 22. Q. Could they utilize more water on the Eastern . Nora than they get at present !- I don't know.
- 23. Q. Is the rabi copply there too low?—Not on the Januarao. The Eastern Nara is in flow all the year round.

#### WITNESS No. 4.-MR. R. J. KENT, Executive Engineer, Public Works Department.

Mr R. J. Kent. 5 Nov. 01.

- 1 Q. (The President.)—You are Executive Engineer, Wosten Nam ?—Yes.
- 2. Q. How lang have you held that aliarga ? ZSix months, 3. Q. From where doss the Western Nara obtain its sapply?—It takes off from the right bank of the Indus about five miles from the large town of Larkana.
- 4. Q. In it a permanent canal?—It was originally an old branch af the Indus, hat is naw an inundation canal.
- 5. Q. Has it got eluioes and a head regulatar ?—It has no hoad regulator, but there are many eluices across it, in the lawer reaches, for regulating the supply.
- 6. Q. Is it an executive division by itself P-Yes, since the year 1890.
- 7. Q. I supposs the executive work upon it is chiefly clearance of silt?—Yes.
- S. Q. Have any impravements been carried out recently?

  —Yes, during the past twelve years many large improvements have been carried out, including the anastraction of two new feeders to the main cause from the river and several targe branch causis.

- 9. Q. It is one of the old-fashiooed inundation caosls?
- 10. Q. In the cilt olearance expensive?—In the main canal although the hed slope is only about 3" par mile still the amaunt of cilt deposited is very small, and for many years post no expenditurn has been incurred in clearing it. The reason for not silting must be attributed to the excelleat draw-off by the large number of branch canala.
- 11. Q. Have you any proposals for improving the canal?

  —Yas. It has been praposed that a new casal should be taken out from the river for the purposs of relieving the Nara of the greater part of its irrigation in the last 40 miles. This canal would bring a large area under cammend which is too high to receive flow water from the Nara and which canally he intended in cool water by life and at the cool water than the state of the cool water than the cool water th which ean anly he irrigated in good years by lift under tha present systam.
- 12. Q. When does the Western Nera cease to flow?— This depends on the condition of the mouth. This year it ceased to flaw at the end of November.
- 18. Q Would there be any advantage in deepening the channel l-1 think pote

- 14. Q. Would it be any advantage to the people to have rati water ?—It might be, but on the whole the recept near to be fairly contented no they are. Years ago the area round the Mancher lake was the finest wheat-growing tract in Sindb.
- 16. Q. Why bus it follen off?—Before the river bunds were made the Indus flood used to pour large volumes of water into the Muncher and the surrounding country. On the fall of the river this was drained off egain into the river by o natural escape which exists to the south of the district. The large area so drained was sour with wheat and other rabi cross The object of the river bunds was to prevent destruction to canals and to enable the cultivatura to grow

Lharif crops which hitherto had been impossible owing to the flood water aweoping all before it.

16. Q. If we had a weir unde at Sukur the Western Karn would link jule it?—It might, end it would then be 5 Nov. 01. u perennial canal.

- 17. Q. (Mr. Highom.)—Are there any distributaries on this canul?—Yes, there are a great number.
- 18. Q. Are they all Government channels ?- Yes.
- 19. Q. Do you want uny more of them ?-Yes, several new distributaries are being investigated.
- 20. Q. What fall have they got P-Falls varying from 3" to 6" per mile.

#### Witness 5 .- Mg. P. J. Connart, Executivo Engineer, Public Works Deportment.

- 1. Q. (The President.)-You ore Executive Engineer of the Begari Canols?-Yes.
- 2. Q. Have you been long in that position? I went up lust April. I was there twice before for shurt periods. I know something about the country.
- 3. Q. This is a group of canals?—Yee, there are three main ones.—The Bogari, the Unherwah, and the Desert Canal.
  - 4. Q. Are they all immdation canals ?- Yes.
- 5. Q. Arn they fur obove Sukkur ?—About 34 miles in a straight huo-60 miles by river.
- 6. Q. How much is the irrigation in that system ?—On the Begari 285,000 neres, on the Unherwah 20,000 acres, on the Desert Canal 130,000 acres.
- 7. Q. Of the total enturable area, you estimate that one-third is ununully irrigated ?—Yes. The Deputy Commissioner considers that on the Begari Canal, we should ullow for half the culturable area being annually irrigated.
- S. Q. As a matter of fact you blink that in land, oachalf lies fallow?—I chould not say that generally. It depends on whether the cultivators cau get sufficient woter, and lubour.
- 9. Q. Is a great extension of cultivation possible P—Yes. The potential area of irrigable land in Baluchistan is about 500 square miles. (Explained from the mup.)
- 10. Q. Have you gone into the reason for illowing the large muonnt of follow?—The reason is supposed to be that land won't stand cultivation more than one year in three. Another reason is that there is not sufficient labour and monute.
- 11. Q Toe Baluchia are not cultivators?—Practically not so far as canal cultivation is concerned.
- 12. Qt The population is scanty ?-Very. Do you get labour from the Paujub. It which y comes from Afghonisian.
- 13. Q. You are too far up to be offerted by the question of a weir at Sukkur?—Yes. The only effect the weir would have in my district would be to make the course of the river more stable by reducing slightly its bydranlic gradient.
- 14. Q. Have you much trouble with silt?—There is A good deal of trouble in old bronches. There is no silt in the first 47 miles of the Begari Canal. The Desert Canal is being remodelled. The surface velocity at its head is six feet per second. The Begari Canal has also a large velocity.
- 15. Q. How far loss the remodelling of the Desert Canol got?—We have completed the remodelling up to the 3th male. The work will be completed this year with the exception of a new canni, the Adiuwab, which is included in the project.
- 16. Q. How for has the remodelling of the Begari got?—
  We have empleted the Contour Survey for the last 46 miles
  of the Canal. Two large new bronches have been surveyed
  und leveled, and the main could and all its bronches have
  been surveyed and levelled. One of the branches 503 miles
  long, runs into Khelut territury.
- 17. Q. You have no estimate or data to lay before Government?—A project called the shikarpar Caunl has been completed. The Begari Canal Remodelling is on ulternative to it. The idea is to find out which in the better scheme. Everything is purely tentative. The Begari Remodelling scheme is not being done on its merits, batto find out what it is worth. I am opposed in the large branch canal into Ktelat territory.

- 13. Q. Have you knowledge of the other canals ?—The Mr. Corb.tt. Began discharges 7,000, the Desert Canal about 5,000, and the Unherwah 2,000 ensess. Two new branches from the 5 Nov. 01. Desert Coool are being made in Balnehistan.
- 19. Q. Then you will have command of a very large areo of waste load in Baluchistan and British territory from the Devert Canal P-Yes. Large orem luve been given nut ta Biluchi Zemindors. Last sonson some land was given out to a Marri Zemindar.
- 20. Q. Where do Biluchl Zemindars get their lubour from f-Chiefly from Sind. They are not importing more labour now because they get all the Sindhi labour they wunted when the Desert Canal was first made.
- 21. Q. (Mr. Ibbetson.)—Now remodelling in being done there must be more lobour. Where will the Bilachi Zemindars got people to de their increased cultivation f—From Sind and possibly the Panjah.
- 22. Q. (The President.)—Is there a dense population in Baluchiston on your cannin?—Yes, probably is dense.
- 23. Q. Where do you make your head-quarters?—Daring the bot weether I am supposed to be on the Kushmur Bund. This is the first year that the Executive Engineer has been ullowed to go to Subkur.
- 21. Q (Mr. Highum.)—Where is the Kashmer Bund?—
  (Described from the map.)
- 25 Q. Whot have you been doing on the Desert Gaual?—Its remodelling has been under construction for the past three years.
- 26. Q. What is the estimate P-About 13 lakha including the Adinwala.
- 27. Q. On whot lines are you remodelling f—Widening and regrading the existing canol and branches and nonstructing new branches. In Khelat we are moking two new branches to replace seven old kurius. I am new proposing distributaries from the branches so os to save the cost of constructing pucks kuriu sinices, and lo enable me to control and regulata the water-supply.
- 23. Q. How is the count working where remedelled?— Exremely well. The people got moke (flow) water where formerly they only get checki (lift), and they got a plentifull supply.
- 29. Q. The result of that would be that you irrigate the greater portion of the area commanded?—They started doing so, but locusts and grassboppers came and are up the young shoots twice.
- 80. Q. You are giving out new land ?- Yes.
- 31. Q. Will the new land be occupied ?—Yes, all the loud the Deputy Commissioner could give out was given out.
- 32 Q. Do they give the land free of assessment P-No, bot practically free from malikann or occupancy fee.
- 33. Q. On the Begari you have a scheme of remodelling What new land will be taken up?—It is proposed to add portions of the Ghar, and Enkkur Canal ayatems to the Begari. It is cleo proposed to extend the caltivotion in Balurhistan. Woste Isad commanded by the Pryari, but for which water is not available, has not been yet given out.
- 34 Q. Is it possible to command much land in Rhelat?— Tes, if the remidelling proposals are carried out. The potential area of irrigation from my district is about 500 square miles.
- 55. Q. You only get a maintenance rote from Khelat?— The Balachis pay us one rapeo per core. They have agreed in pay Rs. 1-S per acre for all land berigated by the Desert Canal after it is remedelled.

Alr. Corbett.

36. Q. That rapes an aero goes to cover the cost of maintenance?—I don't know how it was arrived of. The onnal is a political one constructed to tempt the Balachi tribes to settle down. It has been successful in that object.

37. Q. Whot do you estimate the rate of maintenance per acre P -- About six annas.

38, Q. You don't moke much profit from irrigation in Khelat ?—No.

39, Q. When you go into Khelat territory how is the management dono ?—There is no menagement. The people irrigate the lond and the tehsilder sends an annual statemont showing the area cultivated.

40. Q. You have no particulars ?-No.

41. Q. If we put a weir at Sokkur, it will not affect your ounds ?-No.

42. Q. I suppose it would have this effect Tho Sukkur Canal would be taken up from the weir and you coold send more water on into Khelat? - I don't follow that. I don't think it would command the load up thero.

43. Q. Is not the river altered very much ?-Very much.

(Explains from the map.)

41. Q (Mr. Rajaratna Mdlr.)—You say new lands ready for irrigotion one given from of water-rate?—No: free nf malikana or occupancy fee. On the Begari, I believe they charge Rs. 2-8 0 in places.

45. Q. The whole assessment is remitted for some years?
No, assessment is charged overy year. No malikana or occupancy fee is charged.

46. Q. (Mr. Ibbetson.)—On entering into occupation of the loud this (occupancy fee) is remitted P—Yes.

47. Q. (Mr Rajaratna Mdlr.)—And not woter-rato?—
Thero is a consulidated assonament for land and water. The
irrigation department is oredited with 78ths of the consolidated
assessment. No remission of the consolidated
assessment is given unless in easo of the failure of crops.

#### SIXTH DAY.

#### Sukkur, 6th November 1901.

#### WITNESS No. O .- Mr. E PINNEY, Executive Engineer, Karachi Canal.

Mr. E. Pinkey. 1. Q. (The President.) - I naderstand you ore in executive charge of the Korachi Canol?-Yes.

2. Q. How long hove you held this charge?—I have only held charge since April last, but was in the come district for about ten months in 1897. 6 Nov. 01.

3. Q. How lang have you been in Sind?-Since early in 1803.

4. Q What is the tutol area of irrigation?—About 70,000 acres on the Punjari and about 203,000 for the whale district.

5. Q. Aro your canals all inundation canals? - Yes.

6. Q Are any of them need for growing rabi crops in Yes, the Pinyari flows and the Bhagar flows a little in the cold weather; the rabi irrigation is all by dift. a little in the

7. Q. Is there much seepe for an increase of irrigation on lands which have not yet been tnoched by cauch? Howe you any projects for extensions?—There are one or two for improving the canals.

S. Q Is there any wish among the people to have rati irrigation? would it pay to deepen the causle so as to make them per unial?—I should not think so. The irrigation from lift is so small at present os compared with the total.

9. Q. It might be extended if they chose to extend lifts?

—At present lift irrigation it so small; it would never be very big; there is no inclination to irrigate from the lift, judging from my experience of what they do in Sind.

10. Q. Is that because of want of energy on the port of the people or is it because it does not pay them?—Partly because of both. In the Western Nori district the land that was formerly irrigated has been deserted in parts and the men have gone to the tail of the eanal where they can get

11. Q. Is the difference between the rates for lift and flow irrigation great ?—Not very g.cat I believe.

12 Q. Have you any private enacls in your district?—None that I know of .

18. (Mr. Higham.)—You were speaking about oultiva-tors leaving lift irrigation, and descring the upper reaches to go to the tails of the canals in order to get flow?—I said that with reference to what is left on the Western Narl

14. Q. Is not that due to the fact that the cost of the lift is sa much greater, owing to the small difference between the lift and the flow rates !—It may be, but I think it is due to its being easier to get cultivation on flow and it pays better.

15. Q. If they could get flow they naturally would Pbeliere.

16. Q. Have you much land under command now that was formerly nnoecupied?-Very much (refers to map and explains.)

17. Q. Everything you have water for is fully occupied? I have no sorplus water, but I could irrigate 30,000 acres more by moking improvements.

18. Q. Where is this 30,000 acres?-(Exploined on mop)

19. Q. Is the rainfall in the Karachi district more than that further north?—I think not. It is very uncertain. In 1897 there was about 13 inches, and in the last three reasons we have not had a couple of inches in each year.

20. Q. Is the enant irrigation supplemented by wells; do they require wells?- No.

21. Q. Can they moture the rabi erop without wells? - I don't know. There are wells, but they also use water standing in the big enoals that has not dried up.

22. Q. They lift it !- Yes.

23. Q. To mature rabi crop they must lift, water either from canals or wells?—Yes.

On subsequent enquiry I find there are some private ennals .- E. P., 8-1-62.

#### WITNESS No. 7 .- MR. R. GILES, Commissioner in Sind.

Mr. Giles.

1. Q. (The President.)—I ondorstand, Mr. Giles, you have been owny years in Sind?—Yes. I have been here 6 Nov. 01, oloso on 33 years.

2. Q. And know the whole pravince from end to end?—I have been in every taloka and know somethlog of every part of the province.

3. Q. (The President.)--We are not concerned here with anostimes of fan ine relief, but it is our duty to enquire how far Sind can subscribe towards the food supply of the contry and whot improvements and extensions can be made in irrigotion. What we wish first to osk you is to exploio some points io the tables, which were sent to na which we find it difficult to understand. Whot chiefly strikes us is the lorge area (said at one place to be 10,000 sq. miles) not assessed and not cultivated?—It is described not quite correctly. I think or irrigable.

4. Q (The President.)—The figures are given in the footnote to stotement "G." Mr. Muir Mackenzie rold it was estimated that 10,000 eq. miles of irrigable loud were still left in the province ?—I have game very closely into the question and undoubtedly the word "irrigable" is wrong and shoold be 'cultivation

whether by irrigation or rain water, wells, etc. I would prefer referring to the statement which follows G among the Rerence Stotistics; with regard to every tulnka I have some knowledge and therefore I can shew you by turning to one taluke only that the word cannot mean "irrigable as it includes land irrigable by rain, land which the Tapadar (who Is the lowest Rerence official) has clossed as culturable. He deem't know whether the Indus water can be brought to it or not; the real proper expression for soch land is "fit for caltivation."

- 5. Q. What do you think, with the amount of knowledge we now have, would be a safe estimate of the orea in Signary when I was discussing it with Mr. Dawson yesfeedoy he said perhaps a good estimate would be a fourth of the 10,000 asy, miles, i.e., of the 63,00,000 acres, but I think a larger area. Mr. Dawson said that his was a very rough estimate. My opinion is that the orea is distinctly inrec. It is quite clear that the GI lakks was a mistake. Take for instance Karachi, where the oulturable area is shown as 51 000 seres. If anything is set led it is that Karachi will not be irrigated by the Indus. That question has been thoroughly threshed out in former years by the Engineers.
- 6. Q. By "Karachi" you meaa Karachi district?-No, the taluka
- 7. Q. There is no canal irrigation in the taluka?—None. I have a report from the Deputy Collector of the Shahhandar Dirlsion lu which he says an area opproaching two lokks is irrigable in that Division alone, hat yesterday I discussed this with Mr. Dawson and Mr. Snumers who was the Executive Engineer of the (anal Division from nhiel the water would be supplied and they were of opinion that probably 60,000 would be irrigable from the Indus.
- 8. Q. In your opinion Mr. Dawson's rough estimate of 16 lakhs as the irrigable area is low?—Yes, I think there is a large area which could still be irrigated. Mr. Dawson has not a very intimate knowledge of the province, After a short service in it he went back to the Presidency and has nolly just returned. He was formerly in charge of the Karachi Division but does not know the prevince
- 9. Q. In your statement "A" there is 1,270,000 neres shown as 'alienated;' that means jagir ?—Yes.
- 10. Q. It is a very large proportion of the province?—With regard to the lagir had it has always seemed to me a pity that canals should not from the first be credited with full revenue. The whole canal revenue cought to be credited to the canals and areas which have been granted for political reasons should be a debit to their proper department.
- all reasons should be o devit to their proper department.

  11. Q. Until you have a perennial supply of course the rabi irrigation will be uncertain; but do you think it would be an improvement to try the perennial or pakka system of load-works purely from a khorj' point of view?—The ordinary cands in Sind have no cold weather supply and you can never toll what the Indus may do at their wouths. Head-works in themselves are no protection as the river may leave them high and dry or crode them ac-ording as it wanders from one side to another. Until you have permanent heads you can have no certainty even as regards your kharif crops and, as a rale, no regular rabi supply.
- 12. Q. A weir here would not do any good to the Begari Canal?—No. The Begari owing to its situation has worked better—it has had less had years and suffered less than most of the canals.
- 18. Q. Do you happen to know if the Engineers have got a project for improving the irrigation of the tract of country at the tails of the Begari, Salkur, and Ghar Cano's?—Yes. There are two alternative project, etc., to increase the width of the Begari Canal, or excavate a new one to be called the Shikarpar Canol. I have written very strongly obout it and I ndvised Government to send up an Engineer. It is very disappointing; the people have suffered for years from an unreliable and insufficient supply.
- 14 Q. All the available money has been spent on the James and Right Bank works?—Yes.
- Jaminso ond high hank works ?—1es.

  15. Q. There has been no large increase of irrigation (according to the statement) in the last 10 years?—That is quite true; we have had a good many bad years. 1897 and 1898 were very good years; 1803 and 1898 were very good years; 1803 and 1898 very bad gears. We have had unnsuelly had years complet with this drought, otherwise our area would have good up very much. Then again the effect of the Jaminso is not included. In the first

year the cenal irricaled only 11,000 acres, in the third year there were over 175,000 acres under cultivation and 4 lakts of revenue. These last figures correspond to the project estimate for the asseath year. The ordinary estimate in Sind is that hand is cultivated eace in three years. The best meas in Sind are collisated every year, but the circumstances vary coormandy. I essid mane a whole taluka where the land is high (under lift) and is only oultivated once in four years that in the north of the Hyderahid district, where there is a large number of wells will good irrigation every field is cultivaled every year. There is a vest difference hotween different parts of Sind. In some places you have only to bring water to hore the land irrigated every year.

16 Q Is there well irrigation independent of canals?—

- only to bring water to hore the land irrigated every year,

  10 Q. Is there well irrigation independent of evanls!—
  Practically none. With regard to sistement "I;" "the area
  under wells," what is put down there as well outlivation unduabledly gets its shief sapple from the evanls. Owing to
  the rise is the level of the water canced by the canals, I
  suggested that this should be altered and the area credited
  to the canals. Sir Evans James took of different view and
  therefore we left things as they were.
- 17. Q. In there any feeling here that what is grown by to well is better than that grown by the canal?—Certainly.
- tho well is better than that grown by the canal F—Certainly.

  18. Q. What do you put that down to ?—The man who has a well will ordinavity be more careful. He has to be industrious to build his well. The cultivotor practicelly resides in the fields. The outtarn would be better than the outtarn of a field under ordinary flow irregation. If I were a zemindar myself there is nothing I should like better than to have a good tract of land irrigated by wells. I am always advising the zemindars to build wells.
- 19. Q. It is much more expension for them? The flow ratea are extraordinarily low?—That is a very hig subject indeed. I hove just recummended to Government that the rates for flow ou the Militane Canal should be raised a little. rates for now ou the Miltr. o Canal should be raised a little. Now that there is perennial irrigation there I don't think the lift rates too high compared with the flow rates; tha lift produces a better crop. Under native rule the lift paid more because the outturn was greater.
- 20. Q. Nothing is credited to the man for his own cost of lifting?—Wo don't charge on wello at all. We trent wells as non-sxistent as regards assessment.
- 21. Q. The last column of the statements of cultiration on wells shows assessment of Rs. 54,000 P.—The rule is this. We assess land which is irrigated by wells exactly as if the stell was not there. If it gets a flow supply we assess it at flow rates. If it gets a lift supply we assess at lift rates. We ignore the well altogether. For instance, supposing the rabi crop was irrigated with canal water at the end of the flood senson and received additional water from the well, we should ussess the field as if irrigated by the canal only. the canol only.
- 22. Q. Would you geremlly advocate the deepening of causis for rabi irrigation ?—That is too much of an engineering question for me. It strikes ms that the causis might
- 23. Q. You are agreed that there is a very large area still irrigable and cultivable in the province and there is lots of water in the Indus?—Yes.
- lots of water in the Indus ?—1es.

  24. Q. Supposing you had monoy to carry out works would there be a difficulty obout finding cultivate a?—Yes, at first, bot they would be forthcoming in time. The Balachts on our frontier are hading for land. Hajputane would also send as men. There is always a want of cultivators at first, When I want to the Janumo last year, there were very few people to cut the crops, but that was practically the first year. You must allow time.
- 25. Q. You say money is given more liberally for canals by Government now thou it used to be ?—Yes.
- 26. Q. What is your opinion about private canals?—
  There are private canals all through the prevince. By
  assuming the entire management of the canals we have spoilt the people for the construction of new private canals.
- 27. Q. Are the private canols properly looked after ?-Not always.
- 23. Q. Are they the private property of individuals or exammanities?—Commanities governily.
- 23. Q. Are people anxious for Government to take them neer?—They like keeping them until there is a dispute. We go on taking over causls. We have just take nover three important causls in one taluks.
- 30. Q With your experience of Sind do you know of places now water-logged which used to be flourishing?-

- Mr. Giles. The best example of this is uniforbiedly the Milhran whem water was given too profusely and a great deal of the land 6 Nov. 01. has become sadden and block from salt.
  - 31. Q. Has this last efflorescence done much harm?—It would be difficult to say, as there are always other areas available; but as cultivation and population increase in a taluka likethis (Sutkur) with villages all about the salt ballow threather with sufficient and the salt ballow threather with sufficient salt about the salt lauls are brought under enliration.
  - 32. Q. What is the population per square mile?—There are about 47,000 square miles and 3,200,000 of people excluding Khairpur. Large areas of Sind are hill and desert. Roughly speaking, half of Siml is culturable.
  - 33. Q. Is the advance of irrigation here, as for nre aware, hindered by want of ostablishment ?- I think so.
  - 3i. Q. (Mr. Hibetson.)—I understand, Mr. Giles, that in Sind as the India supply never fails, water is pleatiful and therefore famine is unknown?—Yes, except in the desert. The moment famine occars there the people all come in execut a certain number, obiefly high casts Responts and a few others, and the consequence is that actual famine relief work is very little indeed. It is not conducted on Famine Code principles. principles.
  - 35 Q. Of course you have good and bad years. What do you suppose as compared with an ordinary year, the difference in the whole yield animants to in the worst year you have knowledge of?—1895-98 was a very had year; 1897-98 a good nme. The difference in cultivation was 700,000 acres. The remissions represent only about 75th of the total less to the country.
  - 36. Q. At any rate though no famine is possible yet a So. Q. At any rate though no famine is possible set a bad year involves an enormous loss of yield to the people which presumably might be remedied by solvenes for making more cretain the supply?—Yes, certainly. It will never be remediable to a large extent except by a system where a permanent supply can be given. There is no permanency in the Sand Canala except the Sulkur Canal and where you have a green supply. have a sure supply.
  - 37. Q. Then your system of assessment is a consuli-duted charge on the assessed aren?—Yes, subject to remis-sions on poor crops assessed by the Tehnildar or Mukhtiarkar assisted by assessors.
  - 3S. Q. Supposing that in a surrey number the total area of which is 6 acres three was an acre of entireation and four acres remained uncultivated, how would you occuss the anapher?—We should take the arse-smeat on the entire area of the number.
  - 39. Q. Supposing the number was entirely usenhivated how would you assess it?—We should take no assessment sabject to the limination that after the number had remained four years in succession uncultivated, it would be assessed in the fifth year, whether cultivated or not.
  - 40. Q The assessment on the number in which there was entired in would be subject to remission for poor crops?—Yes, even on the uncultivated number of second in fifth year remission would be given if from any reason soch as failure of water-supply, cultivation was impossible.
  - 41. Q. What is your scale of remusions?-If the gross rolluce exceeds twice the assessment no remission is given, If it does not, we take one-third of the produce.
  - 42. Q. What proportion of the revenue is credited to canals?—90 per cent.
  - 43 Q. Is that a direct or indirect credit f-It is a book credit.
  - 41. Q. Do you know what share the Lucal Government takes:—I don't know.
  - 45. Q. You tell us that private canals have been gradually absorbed ?-Yes, there is still a certain number of private oanals,
  - 46. Q. Now in nn ares where Government is not p 40. Q. Now in an area where coverament is not pre-pared to undertake works for the supply of water, would it not be a good thing to stimulate the construction of private canals?—I don't think so. The people would not make them. They are all looking to us.
  - 47. Q. You think nothing we could do would, stimulate tle construction of private canals ?- No.
  - 43. Q. Do we take a royalty for the use of river water?
  - 49. Q. Have you any power to anthonise a conal being enried over the land of another man?—No. Neither do

- we generally help them .- Yes, the Bombay Irrigation Act provides for such authority, but it is very seldon used in
  - 60. Q. You don't think this is an abstacle ?- No.
- 51. Q. According to the Bunhay Rule no revenue is taken for private improvements. How do you reconcile this with taking more than one-tenth of the manal revenue in laud irrigated by private encals?—Most of our private canals take out of Garcenment canals. Private canals from the river are almost unknown.
- 52. Q. My points this do you think a liberal reduction should be given on account of outerprise in making or improving private canals. Bu you think it would be a stimulus ?— I would not reconnected that for a moment.
- 63. Q. (Mr. Higham.)—There is a small reduction I ree?—Yes, that is for clearance.
- 54. Q. (Mr. Ibbetson.)—I understand you to think that taking Sind as a whole two-thirds fallow is not an excresive estimate?—I think that would be about correct.
- 55. Q. Do you think that this large follow area is due to want of labour! Yes, I think so.
- 50. Q. As the population increases you may expect to see that diminish !- Certainly.
- 67. Q. Mr. Pelliser accme to think that a perennial supply would not reduce the fullow Irrigation ?- I do not
- 58. Q You say wells are very volumble to supplement the canal irrigation in the rabif Yes, in certain areas.
- 69. Q. I understand that well lerigation is charged by. Q. I understand that were tregation is energed at the ontes which they would pay for the usualble canal irrigation if they took it f-Generally so; if the land would ordinarily be irrigated by lift then the kharif lift rate (the lowest rate of assessment) would be taken, and if by flow, then the flow rate.
- 60. Q. Is not that assessing private improvements?—
  If we were to assess it according to the lift rath rate we should put on a couple of rupes at least. If you look at our table of rates you will ree that this is the case.
- 61. Q. Practically then the well does get loner rates ?-
- 62. Q. I see from statement E that in 1896-97 there acres 4,699 wolls, in 1897-98 2,000 and in 1898-90 5,699, What does that mean f.—The number of wells depends on the goodness or otherwise of the inundation.
- 63. Q. Does it mean the number of wells netually worked !- Yes,
- 61 Q. At any rate we have the fact that you have never reached a maximum of 6,000 wells in Sind?—No.
  This statement E is a statement of cultivation by wells only you ought to add the number of wells nited by canals—9,328. Take 1899-1900, 5,617 wells; in addition to that in that year there were 8,328 aided by canals, altogether
- 65. Q. In the mreas in which wells can be constructed moderately and can be worked at a proof is there much room for extension?—Yes.
- 63. Q. What could we do to slimulate that extension?—
  If you could do away with all the present complicated rules regarding tokari and allow us to give takevi on simple
- Gr. Q. What are the main points you would sorgest?—
  I must refer to the present rules. When the Makhtiarkar has drawn a cheque it has in come back to the fluzur Deputy Collector for an endorsement of an order of payment. I should like to see one document which should form the application and the bond. That document should he given to the zemindar who should present it to the Mukhtiarkor for codrasement as to the amount of land to be held in security. I don't think it is necessary to go thereoghly into whether the takur is much needed or not. Some certificate is necessary. That heing satisfactory the applicant takes his money.
- 68. Q. How long do you postpone the first recovery full depends. There are two systems of talant grants under two different Acts. Under the Lond Improvement Act, the two different Acts. Under the Long ampravement act, the postponement is ordinarily fixed with reference in the time when it is estimated that the improvement will begin to yield a return. Under the Agriculturists Loans Act, the postponement of the first payment is usually for 12 months.

- 69. Q. What is ordinarily the period of recovery?—Up to 20 years in grants made nuder the Land Improvement
  - 70. Q. Is that ordinarily given ?-No.
- 71. Q. Why?—I don't think the Revenue officers are always as lenient as possible and in Sied few (if any) large works rendering long period advisable ore carried out by private individuals.
- 72. Q. What is the ordinary period allowed for the epsyment of, may, 300 rapees ?— From five to six years.
- 73. Q. Would not longthening that period premate upplications for taken's—I don't think so. With regard to taken's I am anxious to make onother improvement. We used to give monoy for canal clearance under the Agricultarist Lans Act no being an urdinary recurring expenditure, but Government now insists on its being granted under the Land Improvement Act.
- 73. Q. Is the latter system more complicated?—Yes, money for ordinary clearance operations should not be treated us Public Works. Must of our money under the Land Improvement Act is given for canal clearance and very little for wells. I think it would be u very great advantage if we suild go back and grant the former under the simple restern. the simpler system.
- 75. Q. Do you think having to pay 61 per cent-makes much difference?—No.
  - 76. Q. What security do you take ?- Land, chiefly.
- 77. Q. The laud to be irrigoted by the well?—I was not thinking of the wells—the man'e holding.
- 78. Q. Do you require collateral security?-Not gene-
- 70. Q. Do you insist upon registration?-That is according to the umount.
- 83. Q. Has a mon to go to a registering officer to register the security?—No.
- S1. Q. Do you lead on the joint security of a village?
  -No-there is no village system.
- 82. Q. Supposing soveral land-owners came and wanted to horrow on their joint security, would you lend them?— Yes, I have got all the people to sign together but of course it has given an immense uncount of trooble, but by that means I have got o consi cleared which they would not have done independently.
  - 83. Q. There is no combination among them ?-No.
- 84. Q. Has a land-owner any difficulty in sinking well. Is be likely to come neross difficult strate?—Yes.
- 55. Q. Should not help be given—boring tools, expert axistonee or advice?—I don't think so. They have their own skilled mon for wells.
- 86. Q! (.Ur. Rajaratus Ildlr.)—Are remissions only ranted in years of drought?—Remissions are granted wheo he erop fails for any cause for which the nutrivator is not
- 87. Q. Evert year it is grauted? It is to be expected every year?—No It is not expected, out of u whole taluka you will not get a single application.
- 83. Q. Do you great remission for a 2-anns or a 4-anns crop?—If the value of the crop is less than double the assessment remission is giren.
- 89. Q. You have no sart of classification ?-No.
- 93. Q. The vaine is double the usessment 2-Yes. Then Government takes one share and the zemindar takes the other two shares.
- 91. Q. Is the remission limited to a tract ur to individual fields?—The individual field.
- 92. Q Even though the onresunding fields may have less f-Yes. They would then be entitled to remission also. It used not to be so. The Remission Fules are obsolutely the result of long experience.
- 23, Q. In stutement E mention to unde of "wells independent of earnly? —They are said to be so; I say they are not.
- 94 Q. I suppose all these well lands are commanded by the canal—they might get a cauch supply ?—I should say a very large aamber cuald.
- 95. Q. If eveal water is used for one month and well water for the remaining peried, do non charge?—We charge the ordinory rate. We generally charge the lift Larif

- 96. Q. What would be charged if a field got assistance from a supply which belonged to Gorernment?—We should charge according to the description of supply received, i.e., a more notes such supply was soperior as, for instance, rabi lift from a canal.
- 97. Q. Are these well lands ussessed independent of the canal P.—In these cases where they are independent of the canal we still examine to see what the consl supply might
- 93. Q. Have you one information os to the number of walls constructed during the last ten years with the aid of loans?—No. There bave been very few. The people making will don't care for loans. They are generally careful men and I don't think they eare to borrow.
- 89. Q. You said if the precedure as regards takers advances was simplified nod loans promptly granted there would be more applications P-Yes. I am trying to simplify the procedure and have called for reports from all Collectors. Before the applicants get the money into their honds there is great delay.
- 100. Q. Why fout people toke the leans?—In the matter of taken's we are going ulong at a tremendous rate, os Relurn I (Recenne Statistics) will show, but the nacertainty as to grants forms a hierance. Thus in the financial year 1897-98 Government was noahle to give uny grant to Sied.
- 101. Q. Would the appointment of a special officer for disbursing loans promoto extension?—That is a question like many others that I have been thinking shoat. I think it might, but the worst of it is that he would be wanted everywhere, and often oil that is necessary is a very little enquiry. One proposal has been put forward, which affects taken; is a one artisin fixed days, the mukhtiorkor should he in the kachori for the disposal of all personal opplications or complaints, the fast being widely known. The tokavi would than be given without only references to subordinates. The proposal is olredy known os "kachari" days, and there is no doubt that it would be an udrantageous one. Sending a chaque to the Hazur Deputy Collector is simply ladicrous; it doesn't make things one atom sofor.
- 102. Q (Mr. Higham.)—Turning again to this question of fullows. I understand that when an estimate for a canal is mude it is customary to take \{ of the area that will be brought under command as the area to be irrigated annually ?—I think that is generally done. I abould say that was the rule. I don't think though there is u rigid rule to that effect.
- 103. C. Looking at the figures you have given to as, it oppears there are about 7½ millions acres on the canalo and 2½ millions arrigated only. In it considered necessary that there should be a fallow two years out of three to save the land from exhaustico ?—That depends upoo the water-supply and the owners of lond you are decling with.
- 104. Q. If you have very good land and plenty of water there is no reesan why you should not irrigate the same land every year?—Yes. There are large areas in Bind enlivated annually. Ordinarily rice is cultivated every year.
- 105. Q. In some ports they give rice laud o fallaw ?-
- 106. Q. Is there room for increasing the irrigation in Sind, out by going into new tracts but by earrying on improvements on the existing causis?—Yes, to a rery considerable extent.
- note extent.

  107. Q. The & rule would not apply?—You would not get an exactly proportionate roturn by remodelling—say you double the orea of supply I don't think you would double the cultivation.
- 108. Q. My point is this. To increase the total area in Find it is not necessary to take up new lands or new tarritory?—No, there is a good deal to be done on existing roads; the remodelling, apart from oxtensions, will lead to larger irrigation of the urea commanded.
- to larger irrigation of the urea commanded.

  169. Q. One of our witnesses coid the people were very right in some evest to ubandon lift irrigation if they got flow lower dawn. Have you known any cases of that sort?—I can give you an instance of ubandoning lift for flow in tha lands odjoining the Jomrao, e.g., the Taudo Allohyúr Tolula the cultivation of which is all under lift and the cultivators of which have been with dilieutly kept from transferring their tenancy to the zemindars on the Jamrao.

  110. Q. The difference between the rates of lift and flow appears to be very slight?—Yes, I am not our priced at your saying that.

6 Nov. 01.

- 111. Q. What is the difference?—Here is a teluka with o lift rate of R2-12 and flow 3-8. In Sukkur, which is a very good taluka, the rates are, flow 4-4, lift 3-9. Rico is more of course. The difference varies. If we had the population the lift would be the hest because it does not render the soil water-logged, has better straw for cattle, and the people live in a happier way in their villoges in the tolukas where there is lift irrigation. Every Revenue officer will soy that lift is hotter.
- 112. Q. Havo you any idee whet the cost of lift may be taken of P-The subject of the cost of lift has been deals taken of 1—The subject of the cost of lift has been dealt with at great length by different officers and is one regarding which I could submit stotistics, but not give any definite figures off hand.
- 113. Q. I want to know whether you can explain on what considerations the lift rates depend?—The lift is a very sure supply. It never fails and never varies. They don't have troubles as regords flooding.
- 114. Q. You don't think it would be an advantage, as far ne the people me concerned, to convert lift irrigation into flow. You think they me better off as they ore P—Yes, I think so, but orops are raised with so much less trouble and labour under flow that limitation to lift would mean a great reduction in the food-supply. Moreover, it is only following on economic law that people should go where they can raise the largest area of every with the least labour, e.g., when the ground only needs to be scratched and the water to be torned on.
- 116. Q. When the Rohri Canal was thrown out by the Irrigation Committee of 1892 were you on that?—No.
- 116. Q. One of the erguments in invour of the project was that it would give flow irrigation ?—Yee.
- 117. Q. I think all the new projects substituted for it will not give flow?—It is rather a difficult thing to say for they are supposed to give a very considerable flow supply. I om very much inclined to doubt if they will give as much os is onticipated. I know lift areas where people connot be got to take up the land, e.g., the Tondo Allahyar
- 118. Q. Anything to do with the rates?—Nothing at all. It would not he wise to say one prefers lift to flow. Either is very geod-for the production of grain in the
- 119. Q. If a weir were made at Snkkur it would reopea the question of the Robri Canol?—Certainly. If the
  woir was possible, abent which I know nothing, it would be
  magnificent in its results. In the first place the whole of
  the Khairpur State could be irrigated, then you come down
  to the Hydernhad District with its high lift lands which
  would nli be irrigated by flow. The Dad and the Nasrat
  Canols would be abandoned of course os independent
- 120. Q. The statements we have bed regarding the weir deel mostly with the right bonk. As regards the effect on the left hank we have not had any opinious?—You con get the whole motter from Mr. Joyner's report.
- 121. Q. Is colonisation now proceeding on the Jam-rao ?—I am just going out to see about it. None is pro-ceeding at this moment.
- 122. Q. Why?—Because there have heen difficulties about the supply, and the Colonisation Officer Mr. Robertson wrote in and said he thought we had better not go on with the colonisation until the success of the canal was more cure,

because if these colonists saw ony deficiency they are apt to pack their goods and go home. The first 8 miles has silted a good deal, but it goesthrough a very hod hit of sandy country. But that in the opinion of the Engineers was to be expected and will gradually right itself. Then where we can we will begin colonisation again.

- 123. Q. You are now marking time ?-Yes.
- 124. Q. How many colonists have you?-26 yeomeo,
- 116 pensents.

  125. Q. The irrigation that has been recorded has been mostly by the existing people?—Yes. To the local people we have given large areas of land.
- 126. Q. The coleaists all came from the Punjob !- Yos.
- 127. Q. Has the question of rates on jagir lends over been discassed f—The question of bakelo bes been discussed as to what the rate should be, and it has been definitely fixed, for Kelat at 1-8 per acre.
- 128. Q. Is there any other case except that of Kelot? Yes, on Jagir lands in Sind irrigated by Government canals the rate on which varies from 10 annas to 5 annas per sere according as the enlitivation is 'rice,' 'flow' or 'lift.'
- 120. One rupes is what a zemindar generally takes as hakabo when he clears a canal.
- 130. Q. And he takes a share besides?—No, he takes nothing more for cost of clearance.
- 131. Q. There are some private channels on the Fuleli?
- 132. Q. If Government made the distributary cheunels, water would be economised?—Yes, but it should be remembered that the esuels had for the most part existed prior to Government toking possession of them, and that they had a vast net-work of private obannels, i.e., distributories from them which it would take un immense sum to re-moke or remodel, and merely to build the sluices on their months means lakes of rupees.
- 183. Q. In many places the water-courses run parallel to each other, so thet each mon may have his own channel; that leeds to waste of water Yes, but the people object to heing charchelders and insist on their right to separate chounels. But in the Hyderahad District, where the old Inundation Cenals are very hed and the clearances are heavy, the people would glodly here their channels cleared by Government. A very curious thing which I may meation as regards the irrigation in Sind is, that under the Irrigation Act the Shiness are the property of Government which the people used to be made to make. Even now we try to got them to pay part, usually half of the cost. Properly speaking, the onus is ou Government. The pelicy, however, is to leave things to work on os they best een on all existing coals.
- 134. Q. What do the sluices cost?—Anything from 200 to 1,000 rapess. If you put oil these sluices in direct charge of the Arrigation subordinotos, it would mean an enormous increese of establishment. It seems better to enormous increese of establishment. At stock watch the new system on the Jamino and see how it works watch the new system on the Jamino and see how it works when canals are end then on that experience improve. When canals remodelled all the sluices are provided by Government.
- 135. O. From whot I have heard the colonists are not 13D. Q. From whot I have neard the colonists are not yeary satisfied. Why are they only brought from the Punjah?—That is the effect of the Chenah. Oor colonist officer went to the Chenah and studied the work there and so sought his colonists from the Punjah.

Note.—The seventh and eighth days sittings were held in the Punjsh, and the ninth to thirteenth days in Rajputana and Kathiawar.

#### FOURTEENTH DAY.

#### Ahmadabad, 2nd December 1901.

WITNESS No. 8 .- Mr. BAHMANJI EDALJI Modi, Deputy Collector, Kaira.

Answers to Printed questions.

Paragraph 1.—The totol area of the Kaira district is 1,021,372 ocres and the total culturable area is 893,307 Mr. E. B. Modi.

3 Dec, 01. The area protected by Gorcrament irrigation works is 8,893 ocres in one taluka—Moter—where the land is irrigated by flow from the Kharl River. About 698 ocres can be wetered from the Kheri River in Mohmadabad taluka by lift.

The area protected by villego werks, namely, tanks, is 20.952 nereo.

The area protected by wells in 47,268 acres.

The roil of the greatest portion of the distict is allorial, while in the western part of Matar trluka the soil is black learny, where rice and wheat are grown. There are also large tracts of had in some of the rillages of knyadrani and Thara talukas called the Mol; the soil carsisting of black soil or white allorial soil, is about two feet deep resting upon a concetionory had of Ilmestona. These bind lands generally lie uncultivated.

If the rainfall is plentifed no artificial irrigation is

Extent to which culture required for the crops sown in the raing teason; even the soporiroz kinds of rice which tipen about the beginning of November can do without irriga-

When the roins full in the beginning people raise seed-lings of rice and havts (Eleusine coracavano) in prepared bads by well-irrigation, so that they may be planted not at the proper time. When the rains foil in the latter part of the reason, rice is watered from tanks and wells, and in the villages commanded by the Khori from the water taken by fow from it.

The rainfoll for the whole district is on an average 26

Rainfall.

Rothes In some years two maximum unwares much us 60 inches
and the minimum 16 icelies. In 1809, the year of drought,
there was not more than 4 or 6 inches of rain.

There is no demand for water in a year of ordinary
Dimand for water daring roinfoll during the south-west
south-west moneous.

Tice which ripen after the cod of the moosoon do require

The crops which require irrigotion are rica and tobacco.

Crops regality irrigation.

In some challeng irrigation.

In some places tobacco is not irrigated, but the superior kinds require two or three waterings nifer the end of the season. In some places tobacco is not irrigated, but a larga portion is inligated about eight times during the season after the close of the rains. The yield of enthicated tobacco is generally double that of the unfringeded. The water of certain localities is specially suited to tobacco. Barley or jon is irrigated generally with brackish water mbod S or 10 times during the season. Wheat is also irrigated if the soil is entable, about four or five times during the cason, and the yield is then three or sometimes four times that of the unirrigated wheat.

Justi is grown by injustical.

Just is grown by irrigation during the summer chiefly for the sake of the fodder.

Sugorcane requires watering every ten days.

The other irrigated crops are the garden crops of outons, chillies, ginger, garlie, cumin, carrots, radishes, egg-plant, edibla hibiscus.

Except in the Khari irrigation tract there is no control over the invigation. Feeple can draw water by lift from the rivers, and have, eince the introduction of the Revised Survey in 1895, nothing to pay; they can also take water from the tanks, bot have to pay the water-unes occording to fixed scales when their lands have no water-rate charged shready on them. Those who have wells in their own fields have not to pay anything; when they toke water from wells in Gorcrament waste lands, they have to pay a water-rate of Rs. 8 per law for the sauson.

\*\*Preserved 5.\*\* Perspirated invitation weeks.\*\* Those

Paragroph 5.—Provincial irrigation works.—There is only one irrigation work which may be called the Provincial Irrigation work, namely, the Khari Irrigation. The Revenue is credited to Imperial Land Revenue. These laro been no new works. This is on old work. The Khari is a small river und tha water from it is taken by flow by 12 villages by turn, namely:—

	,
1. Kawra. 2. Kajipuru. 7. Pinglaj. 4. Pansoli. 5. Dhadhal.	7. Bherai. 8. Govindapura (Inami) 9. Necka. 10. Novagam. 11. Kathwade.
6. Malarpura.	12 Chanidra.

The river is divided into two branches of Pinglaj, the villages of Pinglaj, Pansoh, Dhadhel, Malarpura, Bherai, Gerindapura, and Nacka taking water from the east branch by turn, while Navagam, Kathirada, and Chandra teke the water from the west branch.

Formerly there used to be earthen hands pot up in order to raise the level of the water, but subsequently mooden claims gutes were put up.

Before 1876 there were no works for regulating the flow of water into the two branches, and the result was that for many years the western branch carried much more than half the water, and the villages on the east branch used to enfer greatly, and in 1878 it was found necessary to give remissions of water-rales in the castern villages.

The Chief Engineer, Irrigation, examined the locality and derised a plan by which the flow could be regulated. It was decided to throw half the water into the eastern and half into the western branch. Other improvements were

No new Provincial work has been sanctioned.

There was a project for making the canel from the Mashra River, and after a good deal of enquiry it was faulty obandoud in 1893 as being unremnuerative. It may be incidentally mentioned here that there is no water in this Mashwa River this year.

The revenue on account of the Khari irrigation is credited to the Imperial Revenue along with the Land Revenue.

Paragraph 6.—District or village works.—There are no district or village works except the village tanks.

These rillage tanks exist from old times, and the villages now and then repaired them; occasionally the District or Tuluka Local Funds repaired some of them.

Strictly speaking, Government are responsible for keeping up these small tanks, but they do not seem to have done unything. In 1892 Government passed o Resolution that tanks irrigating more than o certain area shoold be kept in proper order by Government and oppointed a special officer to examino and report upon these tanks | nothing, however, seems to have come out of it.

No remissions of land revenue are given when the works

No new tanks have been constructed of late years.

There was a project for repairing the ambankment of on irrigotion tank, called the Pania, in the village of Dha-rora in Mater Taluke, but as the Inamders of the village were too poor to contribute anything towards the cost Government would not take up the project. The village has suffered greatly in consequence.

It is desirable that District Funds should be expended on small tanks which Government will not look after.

The protective value of village tanks would corininly be increased by devoting more money and greater attention to their up-keep, so as to make them hold water for two years.

The local authorities may be held responsible for these works, but the increased revenue should be given to them.

Villaga timks in this district are no doobt useful both for men and for cattle. The water is not generally used for drinking purposes, but people generally batho in it. They are useful also insumed as the wells situated near them remain ewect owing to the percolation from the tanks.

Parograph 7.—Wolls.—The lands ordinarily irrigated by wells are as follows in five of the talukas :—

Matar			_				3,717
Mehmade	had		:	:	:	·	4.6.8
Thuara			:	:	:		470
Anand							3,953
Nadiad						•	9,662
The lands i	ricai	ed in	1899-	190).	the v	ear of	drought:

					Acres.
Matar					6.852
Mchmud	bad				10,725
Thesrn				•	403
Annd	,				11,743
Nadiad					17,775

The amount of takavi given in 10 years for the construction of wells ie na follows :

	Takari.	Nomber of wells.
Metar	Ps. 3.145	17
		. 123
Melmadabad		
Thusm	. 26,950	90
Anand	. 23,666	55
Nadiad	40,979	216

There are no concessions given to the constactors of wella except that no extra revenue is to be levied.

It is perhaps not goite possible, though it is desirable to stimulate the construction of new wells by more liberal ad-vances. People do not think that they can make sufficient

Actes.

Mr. B. E. Modi.

use of well weter for irrigation; they'do not feel sore of roising remnnerative crops.

2 Dec. 01.

١.

The lands that were in the sandy alluvial soil did not generally fall during the drought of 1899-1900, but those in the hard rocky soils of Kapedwanj and other talakas failed and held water for irrigation. They were not despensed.

The nverage depth of water helew enrince varies from 90 and 100 feet in villages near the Mahi River on the east of the district to 30 and 40 feet in the alluvial lands.

The cost of wells depends upon the dopth and the diamster. Lorge wells intended for working 4 kes or leather bogs cost from Rs. 500 to Rs. 1,500 according to the dopth; wells of ordinary depth for 2 kes cost from Rs 400 to Rs. 500.

The area served by one well is from 2 to 4 seres per one kes; it depends also upon the nature of the crop.

With regord to the possibility of finding arream wolls in Gajarát no definite opiaion can be formed as our knowledge obout the lower strata at a depth of, say, 500 feet is very meagro. Government should, however, make experiments in the lower tract hetween the peniusula of Rathinwar and Ahmadobad district, becouse it is very likely that the underground streams flow from north-east to southwest in Ahmadahad, and are meeting with the horder strata of soil in Kathinwar.

strata of soil in Kathiawar.

Paragraph 8.—Drainage works.—There used to be water-logging in several villages of the Matar taluka and in some villages of the Anand taluka. In 1830 it is stated the district was unhealthy and the crops saffered, and a system of drainage was earried out from 1831 to 1840, which greatly improved matters. The drain in Motar laluka had silted up about four feet and, owing to the representations of the Settlement Officer, who made the revision of the survey assessment, a scheme had been prepared. It was earried out as a fomine relief work.

#### II. A --General

- 1. The naswers relate to the Koira distrist. I have been sorring as District Dopnty Collector for several years.
- 2. The overage rainfall is each of the mouths of June, July, August, Septomber, and October is as follows:

					inches.
				•	3.63
	•	•			8.83
		•	•		9.79
					6.23
•	•		•		0.10
•					

- 1. Q. (The President)-You are Deputy Collector of the district of Koira?-Yes.
- 2. Q. How long have you been stationed in that district?—Altogether about sixteen years.
  - 3. Q. Then yan know the district well ?-Yes.
- 4. Q. Were you there throughout the last famine?-
- 5. Q. You have some irrigation works in Kairo ?-Yes.
- 6. Q. I understand that they irrigate 8,900 ocres?-Yes.
- 7. Q. But only a very small portion of the district is protected by irrigation ?- Yes.
- 8. Q. I understand that the rainfall in your district has generally been omple?-Yes.
- 9. Q. What was your loss of population by famine?-About one-and-a-half lakhs out of nine lokhs.
- 10. Q.—With the experience you have hed of fumine, what measures would you take to protect your district from it in the forme?—If we could make tanks that would hold water for two years, it would be advantageous.
- would hold where for two yeors, it would be advantageous.

  11. Q Do you think there is nny reasonable belief that tanks con profect you?—I am quite certain they con. In the Kapadwauj oad Thasia talukas where there are andultiag lands, water can be held up for two yours. There are also cortain localities where wells would be n great protection. During the last famins, in Jano and July, wells were used for growing cattle fodder. The season had passed for growing it; it does not ripen in the cold soason.
- 12. Q. (Mr. Ibbetson)—The people grow juari in the cold sesson ?—Yos.
- 13. Q. (The President.)-If there were tanks what would they water from them?-They would water rice.
  - 14. Q. Rice only ?-Yes, generally rice only.

- In the other meaths there is prectically no rain,
- 8. Is there any obsteels to the extension of irrigation nrising from-
  - (1) Sparsity of population ?-Noas.
  - (2) Insufficient sapply of plough cattle !- Nons.
  - (3) Insufficient supply of masuro ? Not much.
  - (4) Unsaitability of soil to irrigation ?-- None .
  - (5) Uncortainty of the enpply of water, or its too late commencement or too early cossation !—The sapply in the Kheri irrigation work is not sufficient after the cessotion of the mins for irrigating more lands.
  - (6) Lack of capital for the initial expenditure, ste.?

    —Capital would be coming forward if there is a certaioty of profit.
  - (7) Fear of calanced rent or revenue assessment?—
    No fear if irrigation is remnnerative.
  - (8) Uncertointy of tounre P-None.
  - (9) There are no other recsons preventing the extension of irrigation.
- 4. Land irrigated from works constructed by private copital orghi to be exempted for over from enhancement of assessment nader the present law. No alterations under the present law are required.
- 5. Loans are not taken freely under the Land Improvement Act for the extension of irrigation, because there are no feeilities for irrigation.

Wells are made from takavi advances.

- (1) There is no necessity to reduce the rote of interest,
- (2) or to remit the interest,
- (3) or to partially remit the edvence.
- (4) There should be total remission is case of failure to obtoin water.
- (5) The present period, 30 years, is sufficient.
- (6) No grants-in-aid ore necessary.
- 6. In this district the ortension of irrigation cannot tend to injure the remaining cultivation by attracting the cultivators to the irrigated tracts.
- 15. Q. Is it o very profitable crop ?-Yes. It is more profitable than any other crop.
- 16. Q. Is rice ever grown under wells? No, but when there is scarcity of water in the latter part of the rains they sometimes use well water.
  - 17. Q. That is lu October ?-Yes.
- 18. Q. When is the rice reaped?—There are two kinds of rice; superior rice is reaped in the beginning of November, interior rice in the beginning of October.
- 19. Q. Does the superior rice crop suffer most in a year of drought P-Yes.
  - 20. Q. Inferior not so much f-No.
- 21. Q. If tanks were mode would the people he reased to teke advantage of them !—Yes.
- 22 Q. They would not decline to uso them?—No. During the last famino they utilized every smoll pond. They lifted water from these ponds and wotored their ries
- 23. Q. The dry orop is obiefly juari !- Bajri and kodva are also grown.
  - 24. Q. Is cotton grown much ?-Not much.
  - 25. Q. What is kodra; is it a millst P-Yes.
- 26. Q. When is juari sown?—In July and Angust; it is grown chiefly for foddor.
- 27. Q. Whon is bajri sown?—In the latter part of June, or sometimes in the middle of June if the rains, are favourable.
- 28. Q. If the crop is sown in Juns and the raios fail in Soptembor would it some to maturity?—Bajri is a very hardy plont and survives for a long time without any water.
  - 29. Q. When is it out ?-In September.

- 30. Q. (Mr. Mair-Mackensie)—Is it tenped as early ns September ?—About the end of September ; it depends upon the time when it is sown.
- 31. Q. In the case of an early erop?—If it is seen in June then it is renped about the end of September.
- 32. Q. (The President)—Is tobased grown on a larga scale?—Yes. It is a very paying crop.

  33. Q. ts it grown by well irrigation?—Yes, mostly under wells. A small proportion only is grown as n dry
- 31. Q. You say there is only one irrigation work in the district which is closed as Provincial ?—I unde a mistoke; I should have called it an Imperial work.
- 35. Q. Is the Khari irrigation work of great value?— Yea very great. It was not of very great valoe during the past fomme; because there was no water flaming, but in odioary years it is of very great value.
- 36. Q. (Mr. Ibbetson)—It increases the wealth of the province?—Yes.
- 37. Q. Would you advocate its extension ?-We have already made as much use of the water as we can. Formerly there was aspecial engineer for the Khari irrigation works, now it in under the Excentive Engineer of the Ahmadabad district.
- SS. Q. You are using all the water that is available?
- SO. Q. (The President)—The only may to increase the supply is by storage?—There was a project for bringing in water from the Mashwaviver, and to have a storage tank near Bokh in the Ahmedabad district.
- 40. Q. In the famine year very little water was loft to the village tanks?—Yes, all the tanks ran dr3, the village tanks were especially dry.
- 41. Q There must lare been great difficulty in watering the cattle?—Yes, they had to be watered from wells.
- 42. Q. Was there great mortality omong the cattle f-
- 43. Q. You say that it is desirable that the District Funds should be expended on anual tanks; has the district got any funds at its disposal?—Money has been spent from the Local Funds on small works. The Kaira District Board is very weolthy.
- 41. Q. Have any tanks been mode by private indivi-
- 45. Q. Is it looked upon as a religious net to make a wall r n tank?—No.
- 40. Q. Hos the last famine given a stimulas to the construction of wells; are people more inclined to make wella than before?—They have been moking some wells.
- 47. Q. Has the number of wells increased !- Very much, chiefly on account of the liberal taken indvances made by Government.
- 48. Q. The people willingly availed themselves of these metacoes?—They did. It is possible that they maiotained themselves to some extent, too, out of three advances. A caltinate who took fis. 400 or its. 500 to make a well, perhaps kept aboot fis. 100 for his own maintenance. We did not exercise any very stringent sopervision considering the hard times the people were passing through.
- .19. Q. What interest does Government charge on these advances?—Five per ceut,
- to. Q. Do you think it would be a good thing for Government to advance money at a lower rate of interest, or even without any interest at oil, in order to encourage the people to build wells; do you think that the people were prevented from making wells on account of the 5 per cent, interest independent of the first people were prevented to not think so.
- f do not think so.

  51. Q. You do not think it is a heavy charge?—Nn, uf course they would be induced to come forward more largely if we remit interest and make greatevadvances of takavi; but as a rule thay are not prevented from applying by our rate of interest.
- of interest.

  62. Q. Yon say, "It is perhaps not quite so possible, though it is desirable, to stimulate the people." Is that on account of their ignorance and indoleure?—They do not know whot paying crops they coold grow from wells; if all the land is irrigated for valuable crops they think there would be on market. Their idea is that if all were to raise garden produce it would become too chiap.
- 53. Q. You say that in some cases the villagors lift water from 90 to 100 feet!—Yes, that is the case in a village near

- 54. Q. Is the water deeper near the river than elsewhere? Mr. B. E.

  -Yes, because the banks are very high; in some places Modi.
  they are 100 feet above the bed of the river.
- 55. Q. At what depth is the water below the surface which they irrigate from wells?—From 40 % 0.45 feet. In Knim there is a town called Dákor where a good deal of garden stops is grown, the wells there are about 40 feet to 65 feet deep. garden crops 45 feet deep.
- 45 feet deep.

  56. Q. Is there any uncertainty as to the proposed afte of used yielding good water F-That depends upon the tract of the constry. In the sentre of the district the people are generally sore of fielding good water. But into western tracts sometimes they get brackish water and sometimes they do not get any water at all at a depth of fifty feet. I know of a well which was annk to fifty feet without water being reached.
- 57. Q. There is genorally one well in each villaga ?-- Yes.
- 58. Q. It is need for drinking purposes?-Yes, but io ome villages there are no wells; the villagers drick tha some villages there water of the river.
- 59. Q. Before making n well do the people employ having tools to see if water is obtainable P.—As a rule they do not; they appear to know where to find water, and work according to old native ideas.
- 60 Q. Supposing the Collector of a district were to lend the people bring tasks, woold thay was them?—I think they would. We had a boring apparatus, but we had no akilind workman to use it, so that we could not use it doring famine.
- corning remaine.

  61. Q. Do they do much in the way of kochcha wells?

  No, except that in the year of drought and during a famine year, they mode many knehcha wells out of the tokuri advances.
- 62. Q. Do they last long?-For one year only, as n
- 63. Q. Do they got takavi advances for kacheha wells?

  -Yes, about Rs. 40 or lis. 50; they can irrigate about 3 acres by the kacheha wells in a taluka ilka Kapadwanj.
- 61. Q. In your district is a programmo of relief-works kept up to date by the Poblic Works Department?—Yes.
- 65. Q. Do you know if there were n programme of that sort ready when the last famine occurred?—There was, bot it was quito insufficient to provide warks for the large number of people that came ou relief.
- 63. Q. When a man irrigates under a well is he charged the wet-rate assessment?—No; he is not charged.
- 67. Q. Not at all ?-No.
- 68. Q. Never?-No, according to the Bombay Revence stere, if a man makes an improvement on his land, he is ot charged any oxtra assessment.
- 60 Q. For all time ?- Yes.
- 60 Q. For all time?—Yes.

  70. Q. That ought to be n vory powerful inducament to the people to make wells?—Yes, very. Doring the revision softlemed when the ald survey assessment was revised, we charged land which was converted into rice hoods according to the vice erop rate which is always higher than the dry-crop rates. Dry-crop land was in reversal places charged at vice rates although the loud was converted ut the expense in the owner himself into rice tands. They thought it was a brack of the promise made by Government that improvements by the people would not be charged.

  71 Q. Has that always been the rule in the Rechain
- 71. Q. Has that always been the rule in the Bombay Presidency? I think that was the rule when the Eurvey Act was introduced in 1865.
- 72. Q. You say that you think that the best way to prepare for famine would be to build tanks wherever it is possible?—Yes.
- 73. Q What do you think abould be done where it is not possible to build tanks?—Wells should be constructed.
- nat possible to build tanks?—Wells should be constructed.

  71. Q. Would you have the wells made by Govarnment?
  —That is a difficult question in answer. I think Gavernment ought to make wells where they think it would be feasible and charge a water-rate. Formerly there were Government wells and when people took water from them they were charged at the rate of its, S per key, and in some backward taluks at the rate of Rs. 5. I think that if the people took water it would be to their advantage, but it may perhaps not be profitable to Government.

  75. Q. It would be no avancies because.
- 75. Q. It would be no expensive business. I suppose that n well under by Government costs a good deel more than one made by the villagers:—No, my experience is the Poblic Works Department can do it as cheaply as the villagers themselves.

2 Dec. 01.

- Mr. B. E. 76. Q. (Mr. Higham)—Supposing Government build tanks, how are they to recoup themselves for their east?—A water-rate of, say, Rs. 5 or Rs. 6 per mat, if they take water by a lift, or if they take water by flow, they might be oharged a rate per core for the area watered.
  - 77. Q. You soggest a charge by mot; what would a mot irrigate?—About four ar five neres where they regolarly
  - 78. Q. You would recover entirely by means of a water-rate f—Yes.
  - 79. Q. You would suggest no increase in assessment P—No, because the people might nat take water every year; they would take it only when necessary.
  - 80. Q. The woter-rate would only be reclised if the prople chose to take water ?—Yes.
  - 81. Q. Would it tend to greatly increase the value of land if lanks were established, and the people kasw that water would be available in a year of dronght P—I think it would increase the value of the land because they would be quito sure that there would be no foilore of oraps.
  - 82. Q. Yon think they would accept the water rate?—Yes, I think that the classification of the soil should not be Yes, I think that the classification of the soil should not be ohanged. There are osrtain classifications and the rates are fixed occarding to those classifications. If there is a revision the classification will be ohonged, and the rates will be increased. The maximum rates for estain classes of lands is Rs. 4. Under the revision it may be increased to Rs. 5 or according to the ti-e in prices.
  - 83. Q. The effect of making tanks would be that it would alter the classification of lands?—That should not be dens; the classification should not be changed, but a general rise in the assessment of the different classes of land should be
  - 84. Q. Would there be on enhanced assessment in case tanks were made?—Not on assount of the tanks; but there will be on enhoncement owing to a rise in prices ernmont would be entitled to chorge a water-rate.
  - 85. Q. You suggest in your memorandom that District Funds shoold he expended on smoll tanks?—Yes, for tanks the water of which is supplied to the villagers.
  - 86. Q. (Mr. Ibbetson)—For drinking water?—Yes, for the people and cattle.
  - 87. Q. Not for irrigation ?-No. Now and then money has been spent upon irrigation tanks.
  - 88. Q. (Mr. Higham)—Very small emounts, I suppose?
    —Amoants of Rs. 500 or Rs. 600. Only when it is certain that Government will not do anything if tanks are mode from Local Funds.
  - 89. Q. It is the exception to moke tanks for irrigation ?
  - 90. Q. These tanks, I suppose, irrigate only a very smell rea ?—Yes. area P-
  - 91. Q. And that in the neighbourhood of the tanks?-
  - 92. Q. If irrigation is carried out under these tanks, can the District Boords charge n water-rate?—They have no power to do so.
  - 93. Q. Then do you soggest that the District Boards should make these tanks and not charge for the water ?— What 1 meon is that if these tanks are maintained altogether by Local Funds the water-rate abould be given to the Local
    - -They have now no pewere to take it ?-No.
  - 95. Q. Government cannot take water-rate from tanks unade by Locs! Finds F—Government do not charge unything because those lands which are under tanks are already assessed to wet rates. Witter-rate is not shown separately, the land and water-rates are grouped together.
  - 96. Q. (The President)—Da you think there ought to be only one rate?—Yes, if tanks are maintained permanently, then only I think water-rate ought to be charged.
  - 97. Q. (Mr. Higham)—Do I nuderstand you to recommend that the local authorities should make a number of tanks and that they should be given the difference between the wet and dry rates?—I should prefer Government to have charge of oil tanks; hot if small tanks are given over to the local authorities then the difference between the dry and wet rates should be transferred to the latter.
  - 98. Q. Have the members of District Boards local knowledge of the districte-They know their districts very well. The Board is composed of persons from different talukas, i.e., one man is elested from each taluka by the people themselves.

- 99. Q. There are also members adminated by Government, do they know the talukas well ?—Yes.
- 100. Q. The members, I suppose, are land-owners? Yes, they are generally village bendmes.
- 101. Q. Yan say large numbers of oattle died from want of fodder?—Yes.
- 102. Q. Did they also die from want of water ?- I do net thinh eo; there was some water in the wells.
- 103. Q. Did the peeple take the eattle to the wateriog places?—In this district they have not to take them to any great distance; because in the Nariod talaka there are wells near the villages, and water was drawn from thom for the cattle to drink, because most of the tanks were dried
- 104. Q. Was there mny water nvailable in the river?—Yes, the river was flawing, but it was nt some distance. In the Sabarmati river water was flowing, but the people did nat take their cattle to the river when it was distont.
- 105. Q. What is the rule about the mointenence of these 105. Q. What is the rule about the mointenance of these tunks; are the people supposed to construct and meiatain them P-In 1892 Government appeinted a Committee to enquire into this very sabject, and in 1995, they passed a resolution in which it was laid dawn that those tanks which did not yield a certain monant of revenue aught to be abandoned and left to the people themselves, and that the larger tanks should be taken up by the Engracering Department; but nothing was danc in our district.
- 106. Q. I suppose after abandoning them no large sums were epent on them  $f = N_0$ .
- 107. Q. What happened doring the famine of 1899?-
- 108. Q. And spent money on them ?-Yes.
- 100. Q. Was everything possible done for them?-Yes, during that time.
- 110. Q. They were all put iato very good order?-Yes, most of them.
- 111. Q. Havs you a programms of relief-works ready in cass of emergency?—It is with the Public Works Department. It is very difficult generally to keep up a programme.
- 112. Q. Have you a programme ready now; suppose you should want it for famine relief works?—I have already made a programme of smoll relief works, and sobmitted it to the Collector become we require small relief works this yeor also.
- 113. Q. What are the powers of the Collector of the district in preparing a programme ?—It is prepared by the Collector and sent to the Public Works Department for approval with regard to technicalities.
- 114. Q. The initial propesal is made by the Collector ?-
- 115. Q. It includes all village works?—Yes. The lorger rojects are prepared by the Executive Engineer, Public Worke Department.
- 116. Q. You mention that in the Moshvo river there is no water?—Yes, that is the case this year; last year also there was very little water; its bed is entirely dry et present.
- 117. Q. Was that the cass throughout the mousaou ?-I think in the beginning of the monecon it was flawing, bat I found it dry two months ago.
- 118. Q. You had a little water in the beginning ?-Yca.
- 119. Q. The rains stopped early ?—We had rains in the beginning of July and they stopped in August.
- 120. Q. After that no water ceald be got out of this river?—No.
- 121. Q. (Mr. Ibbetson)—What river do you refer to ?— The Mashvo. But there is also the Vatrak river. In this, in ordinary years, there is a good deal of water flowing throughout the year.
- 122. Q. You had a good sapply during the rains?—Yes. The supply in the rains never fulls and could be used to fill tanks or depressions. The river is rather deep; and the hanks are high in several places.
- 123. Q. How high?—Ahaut 1a or 20 feet, and semetimes 30 feet. Generally the level of the country is higher than the bed of the river; the banks in most places are generally very steep.
- 124. Q. (The President)—Is the land higher than the suke?—They are on n level generally.
- 125. Q. (Mr. Highum)—Yau say that wells if mode would cost a great deal?—Neer the Mehi river they would have to be very deep and would in consequence be very

- 126. Q. (Mr. Ibleison)—Would you edvocate large storage tanks?—Yes.
- 127. Q. Large enough to store a two years' supply ?-Yes.
- 123. Q. Suppose you had golf-rater enough for two years, and that in the first year the people had used built the water and were ready to use more; would you refuse to give them more water so as to provide for a possible famine?—No, we not not likely to have another famine for a long time. I should give out the water.
- 129. Q. Sappore you made a tank to hold a two years' supply; if the cultivation below the tank were to be extended, would you supply the new area with water but of your second years' storage;—We would not allow more hand to be irri-
- 139. Q. Why not ?-We would not know whot kied of a year was before us; it might be a dry year, oud we ought to he prepared for it.
- to be prepared to it.

  131. Q. Would you refuse water for oultivation on the change of the next year being a year of drought?—Yes. I would refuse to extend cultivation for fear of the next year being a year of drought.
- 132. Q. How many years of drought have there been within the last 30 years in Kaira?—Three years; 1877, 1899, and pethaps this year.
- 133. Q. You had two years of drought out of twenty-five ?-- Ves.
- 134. Q. Thore have been very few famines?-Yes.
- 135. Q. If you stored water in the hot weather for next year's cultivation there would be very great lose by evoporation ?-But that would be calculated.
- 130. Q. Would you refuse woter stored in tanks for new enlitvation below the tanks on the chance of the next year being a year of drought which only comes once in 12 ar 15 years, and nowith transing the loss by evaperation?—Yes; we have suffered so much.
- 137. Q. You say that on the tanks they practically grow rice only ! Yes.
  - 139. Q. Rabi crops might also be grown ?- Yes.
- 139. Q. Would that be on the same lands?-Yes, after the rice is reaped.
- 140. Q. The crop is not nearly so good as that grown na separate and ?—No, not so good.
- 141. Q. Why do they not grow the rabi erop on separate had?—The people teks the climace of hoving two erops, generally.
- 142. Q. Would it not pay them better to have rabi on separate land !—No.
- 143. Q. Why is that !—The value of rice crop is o-nel-detable, and so rice is grown on overy field they have.
- 144. Q. You say that in a famino yeer all the village tanks dry up?-Yes.
- 145. Q. Did you get ony erop sown in the maint lands in the beds of the tanks 9-1 know of only noe village, Alina, where crops were sown in the beds of the tanks.
- 146. Q. Are wells made in the beds of tanks !- In some places the people do make such wells; they take up water from kerheha wells in the beds of tanks and irrigate some of the lands. They get very sweet water in such wells.
- 147. Q. Do tunks affect the lovel of water of the sarounding wells ?-Yes.
- 148. Q. You sey the District Bourd ie rich in Koira? -
- 149. Q. In the famine year they had, I suppose, a very mall income f-Yrs.
- 150. Q. If they were well off why have they never done unything for the tanks in the district f—They have been repairing touks used for drinking purposes for eattle. They have made no irrigation tanks. In very rare cases they bave repaired irrigation tanks.
- 151. Q. Sappose n mon wanted to make a well and the Nine per cent.
- 153. Q. (Mr. Muir-Mackenzie)—Not more than that?
  -At most 12 per cent; the rate of interest is not very high
- 163. Q. It depends, I suppose, upon the class of the cultivator who mants to borrow?—Yes.
- 154. Q. (Mr. Ibbetron)—What rate would the ordinory cultivator have to pay!—Nine per cent.; sometimes they get it at 6 per cent.

- 155. Q. You think that the 5 per ceut, charged by Government is no obstsele to the extension of wells?—I don't think it is an obstacle.
- 153. Q. Do you mean that if Government were to remit the interest to-morrow, people would sink more wolls than if Government did not remit the interest?—One cannot be sore, I think if Government were to tell the people that they would be charged no interest they might be induced to make well.
  - 167. Q. Woold many roms forward !-Yes.
- 168. Q. You say you had bering tools, but that the prophe did not use them; was that because you had no experts to work them?—You.
- 150. Q. By boring tools do you mean tools with which you make a hole to test for rock hofore sinking a well?—We had an instrument called a "jumper." The people could not use it.
- 160. Q. Was the apparatus a drill with which n small hole is made to see whether rock is found, before sinking a well?—Yes. The natives too have such an instrument.
- 161. Q. Do they find them neefal?—They are not much stailed of. The people generally know where to sink a well. They do not, therefore, use these tools though they might prove useful.
- 162. Q. Do the people know of the existence of three drills?—Yes, there are native workmen in the villages who make borings in the bottom of the existing wells in order to tap better springs, but on the surfoce of the land they do not uso boring apparatus.
- 103. Q. What size of helo does the drill make?—About 4 or 5 inches in diameter.
- 164. Q. You say that the people have not much confidence in the promise of Government that no essessment will be imposed upon improvements on their land?—Yes.
- 165. Q. Is there no law or rule exempting private improvements from assessment?—They feel that there is no gustentee that Government will not enhance the assessment.
- 106. Q. If the term of exemption were fixed at 30 years, would they be satisfied !-- No.
  - 167. Q. They would like to take their chance ?- Yes.
- 168. Q. Rather than have a dofinite relief for so many care?—Yea. years?
- 169. Q You suggest that Government should make wells and cherge, say, Rs. 8 per kes P—Yes.
- 170. Q. You would not have Government make wells in private haldings without the consent of the helder ?- An,
- 171. Q. Do you think the holders would agree to Government coming in and making weth on their lands?—Xes, they would; because they would have to pay nothing unless they took weter.
- 172. Q. Would not the cultivator object to Government subordinates ontering on their lands to dig wells [-] do not think they would object. They would be only too glad to horo wells in their fields, because they would be quite sure that they could get water whenever they requir-
- 173. Q. They would rather hove that than take money from Government and dig wells themselves?—Yes.
- 174. Q. What does a well cost?—Rs. 500, but it depends upon the diameter of the well and on its depth.
- 175. Q. Government would only get Rs. 5 to Rs. 8-8
- 175. Q. How mony kee would a well have ?-About four kee; two on one side and two on the other.
- 127. Q. De you think thei Government ought not to change the classification of the lund; is not this the rule?—
  I think that is the rule now made; there is a general clause that ou all improvements mode by Government no extre rate is to be charged.
- 175. Q. There ere mong years in which u man ic doubtful as to whether he will take water for his rice erop. Many
  mrn I suppose hold off from taking water in the hope of
  getting rain and refuse to take water, because they have to
  ray a rate?—Yes. The people might he induced to take
  advantage of the water if a reasonable land revenue were
  fixed. If that were the case they would take adventage of
  the water as soon as possible.
- 179. Q. Surposing Government were to allot to the Die-trict Boards a portion of the reveaue or allow them to take part of the water-rate, do you think that they would do

- Mr. B. E. any thing in the way of helping tank irrigation ?—I think Modi. they would.
- 180. Q. They could repair the tanks ?-Yos. 2 Dec. 01.
  - 181. Q. Scattered tanks and small taoks managed by the Poblic Works Department would be very expensive; do you think that the District Boards sould do this useful work !- That is what I have suggested.
  - 182. Q. Why do they not do it; I suppose there fe no want of money?—They bave to spend a good deal of money upon reads. We spend rather less upon tanks hecause we do not got any revenue from them.
  - 183. Q. Supposing there is a logal difficulty about the District Beards dolog this, do you think it would be a good thing to remove any disability that may exist?—I think It would be a good thing to ahargs the water-rate and to spend money from District Lecal Fonds on irrigation works.
  - 184. Q. For instance all those small tanks which Government has decided to abandon might be usefully repaired by the Dietrict Boards ?—Yes.
  - 185. Q. Would the tanks pay for their repairs ?-- I do not know, hecaes io some cases very small areas are Irrigated-only half nere or no nere or so.
  - 186. Q. Are they for drinking purposes?—No; they are used for irrigation; they are far away from the villages.
  - 187. Q.—I soppose a good many of them would pay; that is to say, the difference between the wet and dry assessment would be more than enough to keep the tanks he -Yes; I think so.
  - 188. Q. Have you got a programme for village works?

  - Yes.
    189. Q. Does that inclode small village tanks?—Yes. 190. Q. In a good year is water available in Kaira? Not alwaye, though there is always a demand for weter.
  - 191. Q. In on average year?-There is oot a large demand, except for rice.
  - 192. Q. The demand is only in a scanty year?-Yes.
  - 193. Q. In ordinary years is the domand equal to the upply of water arailable in Kaira for irrigation?—I think copply of water a The water is not used up except in the wort of the district.
    - 194. Q. That is your experience !- Yes.
  - 195. Q. Have you got figures for the areas irrigated in 1899 and 1900?—Yes. Here they are.
  - 196. Q. I oco that the oreas of fodder are doubled and in some cases trobled P-Yes.
  - 197. Q. What was the reason for that icorcase?—All the cultivators tried to grow fodder as much as possible.
  - 198. Q. In ordinary years wells might be used for irriga-ion?—Some wells were used.
  - 199. Q. You say some wells were used?-Yes; many wells are not used in ordinary years.
  - 200. Q. Why There is no demnnd. Gram is only grown to noy considerable extent in the west of the district. They grow pulses, aveo though there are wells they do not use them.
  - 201. Q. You are speaking of wells as well as of tanks? -Yes.
  - 202. Q. The wells are sometimes not used at all?-Yes.
  - 203. Q. Then it woold be somewhat risky for Government to undertake the construction of wells !-- Yes. The people will not sick wells because they are not quite sore that they will require well water always.
  - 204. Q. Would they like Government to do it for them?
  - 205. Q. Are there many kachcha wells dug?-Yes.
  - 206. Q. They were not all disused ?-No.
  - 207. Q. The area irrigated by kachcha wells is very mell?—In some talukas, I thiuk, it was very considerable in the famine.
  - 203. Q. The cost is Rs. 50 for a kachcha well, and it lasts for ten years?—Yos.
  - 209. Q. Is a leother bag and a rope included in the Rs. 50?—Yes, cod they sometimes spend their takavi money in cods alco.
  - 210. Q. What do you suppose to he the actual cost of diggiog a well?—Ahoot Rs. 10 to Rs. 15.
  - 211. Q. You say the area served by one well is from two to four acres per kes?—Yes.

- 212. Q. It seems to me to be an extraordinarily small nren?—Yes.
- 213. Q. What sort of erop do you get ?-Tabacco, sugaroaco, and vegetable.
- 214. Q. Does not the irrigation of arops like juari and bajri pay when it is from wells ?—They do pay.
- 215. Q. At present it seems to me that all irrigation is confined to the richest crops ?—Yes, but in coils which are solitable for wheat that crop is irrigated.
- 216. Q. Are rabl crops irrigated in this district ?—Yes, in the Mater talnka wheat is irrigated, and the yield is two or three times the average yield of unirrigated wheat irrigated onder wolls.
- 217. Q. Suppose you were irrigating rabi crope by means of a well; how many neres would be irrigated?—I think from three or four acres per kee.
- 218. Q. If two or three acres of vegetable and rice can he irrigated, surely at least dauble that area of wheat should be irrigated; woold not the area be very much larger?—It would not be more than four acres.
  - 210. Q. Not mere than that ? -Nn.
- 220. Q. (Mr. Rajaratna Mdlr.)—In your memorandnm you refor to rice lands irrigated by wells; what do you refor to?—I refer to dry laudo made into rice lands by making hands round the fields. The rate was increased upon those lauds, because they were converted into rice lands and rice would be grown upon it.
- 221. Q. How many kinds of rice are there?-Two kinds. Akathra and irrigated rice.
- 222. Q. (Mr. Muir-Mackenzie)-In the Mater taluka, we have new passed an order to strike off the increased assessment?—Yee, on account of local conditions.
- Mr. Muir-Mackenzie explained that a slightly increased rate is charged on now rice lands, but not nearly so high as on old rice lands. The difference was the same between that of old and new wolls.
- 223. Q. (Mr. Rajaratna Mdlr.)—You soggest that the tanks may be handed over to the District Beards ?—Yes.
- 224. Q. Would it not he better to hand them over to the villagors who are mach more interested?—No, because there are very few cultivators. There would be only one or two cultivators who would be keen on the subject.
- 225. Q. If there were two or three ther would be better interested than the District Boards?—They would not take them; they think that it is the duty of Government to do everything for them.
- 226. Q. Suppose you reduce the assessment by say 15 or 20 per ceet, and hand the tanks over to them?—They would become more careless.
- 227. Q. Do you know whether the District Boards repair tanks which are used solely for irrigation purposes and for no other?—I think there are some tanks which are used simply for irrigation that they have not repaired.
- 228. Q. What was the objection ?—The District Boards were not justified in repoiring them, but out of pity for the people they have done it in some cases, as it would be a pity to allow old tanks to go out of repair altogether.
- 220. Q. The tanks had been osed for drinking purposes?
- 230. Q. In paragraph 1 yoo say that no water-rate is charged for water taken from a river?—Yes. Formerly the people had to pay what was called the dhekhudi coss. At the time of Revision Servey, Government thought it advisable to remit that coss for taking water from the river.
- 231. Q. Does that apply to all rivers, or specially to one river ?—To all io the Kaira district; and if I mistake not, it is applicable to the Ahmadabed district also. There was a good deal of correspondence about it with Mr. Oznoce, Director of Agriculture, who was of opinion that no water-rate should be charged for taking water from the rivers, in order to accourage irrigation from them.
- 232. Q. In the same paragraph you make a reference about wells. Poes that refer to Government wells?—They might have been made by Government. I say that the people who had been entilled to use water from these wells ought not to be charged a water-rate.
- 233. Q. Lands under wells according to the Bombay settlement are not liable to enhancement of assessment?— Yes, because the classification connot be changed.
- 234. Q. Not at the and of the settlement period ?-No olnesification can be changed.

- 235. Q. The classifications are never altered f-No.
- 236. Q. What then is this enhancement due to ?—Tho general rise in prices and certain other considerations.
- 237. Q. If there were no enhancement under any conditions, would that given stimulos to the extension of wells?

  —It would under the present settlement.
- 233. Q. You refer to a guarantee being given that there will be no enhancement. Do you think that that would result in inriher extension of wells !— There would be, but that would be precisedly a permanent settlement and whether it would be advantageous to the country or not I cannot say.
- 239. Q. Are any facilities giren for the construction of canals by private capitalists?—No concessions except that nothing will be charged on account of unprovements on the kind.
- 240. Q. Supposon canal were constructed from a river, would there to no charge for water ?—No, not under the present law if made by presse persons.
- 241. Q. That should be a sufficient inducement?—Yes, I think so.
- 212 Q. How is it then that there are so few causis ?— There are no facilities for constructing them.
- 213. Q. (Mr. Muir-Mackenzie.)—In ordinary years the dry crop is pulse i-I think so.
- 244. Q. Is there a very large area under rice coltivation which is not commanded by tanks f-No.
- 215. Q. Somo rice crops depend entirely on rain ?- Yes.
- 216. Q. You think it would be a decided advantage if n very much larger proportion of area were irrigated by tanks?

  —I think so.
- 217. Q. If tanks were provided for rice cultivation, would they ensure protection against the ordinary fluctuation of the senson?—Les.
- 218 Q. For instance the rainfull in Kaira is between 16 and 60 inches ?—Yes.
- 219. Q. In the year of 16 inches minful would not the rice lands, irrigated by tanks, have a considerable advantage ever these which are not irrigated by tanks P-It would depend upon the expectly of the tank; if the tank were dry, 10 inches of rain would not fill it.
- 250 Q. Suppose in a rear when 16 inches is the rainfall—that is not so bad as in the famine year you had only four inches and the tanks were not full—that the fall were distributed over the period of two months, would the tanks to filled up and wand the water be of use to revive the dry lands?—I cannot say.
- 251. Q. On the other hand if the rice crops had not had the benefit of the tank they wight bave withered ?—Somotimes it happens that with a lattle percolation rice lands rotain a good deal of moisture.
- 252. Q. As regards ordinary years you say that rice is gramm under tanks ?- Yes.
- 233. Q. Then would it be fair to draw from that the conclusion that it would be ndvantageous in n famino year to construct rice tanks as a useful form of famine relief work?—We have been doing so.
- 254. Q. (Mr. Ibbrison.)—You are not making a single one this year because they are too expensive; do you not think it would be advantageous to make new once?—I thak the cast is too heavy. They would be very advantageous if we could dig them at a low ecot.
- 255. Q. Having regard to the fact that they woold give employment to famine labour, do you think tanks woold be an advantageous form of work?—Yes.
- 256. Q. Perhops you could spend your money better in maintaining old tanks than in building new ones ?—I think so.
- - 233. Q. New tunks for rice irrigation?-Yes.
- 250. Q. A great many kachcha wells were made during the famine year?—Yes.
- 260. Q. Were they made mostly from tokari advances or from mensy-lenders?—Bostly from taken advances.

- 261. Q. In what month did the people take it—is Nov- Mr B. I. ember !—Early in October—the begunning of October.  $M_{c,h}$ .
- 262. Q. In your table of rainfell in Kaira you show that in October you had only 10 cents, and 6 inches in September, and practically none after that f—Yes.
- 262. Q. Therefore it was not possible to find out in September whether famine was imminent?—Nn. This year we knew by the end of September. In 1899 we had no rain in July, Angust, and September.
- 261 Q. In that year you had hardly any tain worth speaking of after September?—Yes.
- 265. Q. Therefore, if up to September, you had a very bad rainfull you could coollode that there would be fumino?—
- 266. Q. Therefore, would it not be the best policy to begin distributing talari from the beginning of October P—I think ft would be.
  - 267. O. For kachela wells?-Yes.
- 263. Q. As regards other wells earld you tell us whether they irrigate from each well a larger area in famine year than in an ordinary year  $\hat{r}-1$  think they do.
- 269. Q. In that area they grow principally fodder?-
- 270. Q. The loss of cattle was enormous ?-Yes.
- 271. Q. The value of wells was very great in saving the cattle?—Yes; many people were able to save their best bullocks.
- 274. Q. In this particular district in which Lackcha wells cannot be easily constructed, as room it is feared that famine is imminent, would it he advisable in good years to multiply the number of wells as largely as possible in order that the cattle might be preserved if a famono occurred?—Yes; it would be advisable to have a much larger number of wells.
- 273. Q. Have you ever heard of a system in the Kathiauar States where the State estimates the approximate cost of a well and gives the money to the cultivator who has to produce a certain amount of water—so much per kees or so much per acto. It would amount in practice to Government paying for a well while the entireator constructs it?—
- 274. Q Would you advocate the latroduction of such a sistem here?—I think, it would be better if Government itself made the well.
- 276. Q. But the cost would be much grenter?—I do not think so. I expect that the Public Works Department can build them at a fair price; I do not think that they would spend much, generally they make very pakka jubs. If they are made by the people themselves they would go out of repair in a very short time.
- 276. Q. Do you think it would be a good thing for the District Boards to be evo powered by law to levy a tank revenue; would that attinulate the people to tanks tanks?—Do you mean making new tanks?
- 277. Q. I mean small rice tanks?—Generally, there are small hollows everywhere which can be utdized for growing rice. Such small tanks I think may be taken charge of by Local Beards.
- 278. Q. Went do you menn?—Their repairs should be carried out by the Local Boards who cook collect the revenue; they ought to be considered the property of the Local
- 219. Q. You say people have not perfect confidence that their assessment will not be enhanced if they make tanks. Why is that 2—Up to this ince the people have had very little cumbence. But they are gradually cetting to understand the policy of Government. This say that if they enever their dry crop lands into rice lands by their own labour they neglit not to be charged enhanced assessment.
- 280. Q. Yon say they have been discooraged. Do you know what is the proportion of these rice lands?—No.
- 231. Q. In one taluka, the Chikhli taluka, they inercaved 40 per cent. of the old rice area by tanks?—I am not aware of that
- 252 Q. Do you know whether there is any complaint nbant water-logged lands?-Yes; this year they complained. They say it is because the mins were not heavy.
- 253. Q. Da you think drains ought to be made?-Yes.

75r Behechar des.

# WITNESS No. 9.—SIEDAE BAHADUR BEHECHARDAS VEHARIDAS DESAI AF NADIAD.

Answers to printed questions. .

Culturable and irrigable areas, &c.—Irrigation chiefly depends upon the season, condition of the soil and the nature of the crops to be irrigated. In tha hot weather crops or a watered every 4th or 5th day. Bat in ordinary censons the interval between the two waterings veries from 6 to 15 days. The following are the principal garden crops and the average waterings they require:—

. 20 waterings from Moy to Giager January. . Do. 34 to 40 Turmeric . do. waterings 11 Surgaroane months during the year except in mouscon.
O waterings from Moy to 20 December. Sweet polotoes . 12 waterings from Ootober to March.
14 woterings from September Chillies to March.

14 wotorings from November to March. Brinjals Onions Garlie to Marcn.
 to waterings in good sensaa.
 Mors waterings are required in years when there are an late rains.
 to waterings from November to March. Tobacco Potatoes .

to Morol

2. Sometimes it is feared that the extension of irrigation 2. Sometimes it is feared that the extension of irrigation will tend to injare the remaining caltivation by attracting its cultivators to the irrigated treets. The cultivation of garden crops requires comething more than the mere presence of water though that is the chief thing. It requires a sufficient supply of manure, working cattle, suitable coil, capitel for initial expenditare, &o., &c. Construction of welle in all fields ar having a casal near by will not necessorily ottract people to plant gorden crops, to the neglect af the cultivation of ordinary crops. There are some caltivators, though few, who have got their own wells hat caunot use them, either the water or soil being unfit, or having no each means as working cattle, manure, &o. But having no each means as working cattle, manure, &c. But there are many cultivators who have get all the other means there are many cultivators who have got an encourse, and the thet water, because the construction of a well requires a good deal of moncy. It is for these oultivators that encouragement in constitution of wells is accessary. If encouragement in constitution of wells is accessary. It a sound passes through a district perhaps there will he rush to caltivota lond under that canal, leaving some waterless tract unoultivated. But there are no reasons why a cultivotor should not try his luck in some better district if he has got means instead of spending his whole life in misery and labour. The land thus left annolitizated will he if he has got means instead or spearing an instructed will he atilized by such cultivators who have not got means or enterprise. There is great scopa for encouraging the construction of walls averywhere without nationpoing any fears or difficulties.

fears or difficulties.

S. It is quite essential to give liberal advonces and indicemente to encourage the digging of wells. Insufficient odvances, delay in receiving them and stringent rulee in recovering them prohibit a cultivator from taking advantage of the Government takéwi. He profoss a loan from a sowcar to o takéwi advance from the Government. As an indicement Government should recover only half the advance, and the remaining half should be written off. When o cultivator applies for the takáwi advance for the construction of a well, hie field should be impected by a Government officer, and in consultation with the cultivator, a place for o well should be marked out. When the accessary conditions for giving a takáwi advance no fulfilled, the requisite amount may he givan to hum. When the cultivator roports that the digging of the well is finished, the Government officer ehould again go thore and give him a completion certificate. As econs as the coltivator shows the completion certificate to the officer who recovers the amount, tion certificate. As soon as the coltivator shows the completion certificate to the officer who racevers the amount, helf the advance abould be written off and the nther half recovered in due course. It such inducement is given, many enltivators will come forward to dig walls. Distribations of advances abould of course he in charge of some high poid officer. On the nther hand, in e place like Radiad, where tobecco is, the obiof gardae crop, such inducements will not anecoroge coltivators to dig wells. Here the value of a well depends upon the quality of woter it contains. There are some wells whose waters are well known for their manuried value. Coltivators, even of a greet distonce, toke water from these wells. Lands wetered from these wells do not require any monnre, and can grow tobacco successfully for many years. Some of the

tchacco enlivators have meens to dig wells of their own. But what ther feer is the theoretainty shout the quality of water they will get. If they get salt water they consider themselven fortunate. But if they get only sweet water their money is lost. Then they have to leave tobacco cultivation and try some ather ganden crops, which are not so remunerative. Instead of trueting their fortunes to such nacertainties they prefer to water their tobacco from old wells which ora well tried.

4. In tracts where the water level is too deep, or that construction of wells is difficult, it is highly desirable that Gavernment should undertake to construct wells. The water of the wells must be carefully selected. Gavornment should undertake to construct wells. The place for such wells must be carefully selected. The owner of the land in which a Governman well is constructed should have the free use of water, and other oultivators who take water from that well shoold he charged ac ordinary water runo for the nee of the woter. If the owner of the hand interwards wishes to parchase sech a well, he should be abla to do as after paying the full amount spent in coestracting the same, and Government should forego all claims over the well. Toe owner should then he free to give water to attend the rultivators and charge them for it. nther cultivators and charge thom for it,

nther cultivators and energy enom for it.

5. As a temporary measure cultivators dig kaoheha wells to irrigate their crops. They are a protection against drought to same extent, but it is not permanently. Kackcha wells do not last long. No special ancouragement is required, as kackeha wells do not cost much. They cost only labour. These wells oro dag by the onlivators thomselves with their home labour. It will be a good thing it local famine labour were employed in digging such temporary wells. temperary wells.

6. A good many wells which ran dry during the list famine were deepened and they got emple water. It is generally the practice to deepen a well which runs dry and it is sure to have more water. But in cases where quick-sand layers intervene further digging is stopped, hecase the wooden chakker, an which the whole construction rest, can be no longer pashed downward. Such wells are abandacad. The effect of the fomine of 1899-1900 on the woter local is amarkable. The water local is a copy down from 3 deaed. The effect of the fomine of 1899-1900 on the woter level is remarkable. The water lovel has gone down from 3 to 7 feet, and, therefore, it operates very hard on the working cottle. The same hullooks are not now able to irrigate from the same well in a doy the same area which they used to water some two or three years beek. The average depth of water is 40 feet. The cost of constructing a well with one kes is 8300 and will two kes \$1400. Three acres are generally irrigated by a well in ordinary years. In this district water from the wells is raised by ordinary kes or water bag. One kes, two hullooks and three men toke from 3 to 4 days to water an agre. 3 to 4 days to water an acre.

7. Reports from Mr. Crimp, and other Geological officers, nre rather discouraging as to the construction of artesian wells in Gujarat. This is a question of much importance and should not be shelved without complete inquiry. In Thasra, Knpadwanj, and other talakae, where the coil is of a different nature, artesion wells are feasible. Anyhow the trisl of digging artesian wells is worth nodertaking.

s. Black soil.—The black soil of Kaim Varies from that and Broach. Small tanks constrocted in this soil will hold water. High northen dome can be made of it without masonry walls. In this district the greater part of black soil is under rice cultivation. In the seeson with a well distribated average rainfall, rice does not require ony artificial irrigation. But in oyear like the present, rice requires water. Baing namble to abtain water either from tanks or wells, many fields ore allowed to dry. In each a seeson enlivators water their rice fields with well water, if ovailable, even at a high cost. There are some tanks already in existence in this black soil. Government takes o water rate from the cultivators for the area watered from these tanks. These tanks have not heen repaired for many years, and os the nature of the soil is rather sandy, they are filled up with silt. They do not hold as much water as they ought to. Besides, Government leases them out to cultivate water ploats sand as singoda in the rainy season. Singoda requires much water sad the effect of all this is that when the cultivator requiras water for his drying crope he cannot got it, os by this time the water level of the tank has gone down. If these tanks are constructed for the use of the cultivators from whom Government takes water-rates, they most be repaired and they should not be leased oot for the onlitivation of singoda. As the rains in recent years have become very irregular the construction and repair of taoka 8. Black soil.—The black soil of Kaim Varies from that

in the black coil is in portant and it will in future he

- o. Government Irrigation Works.—In the Kaira district water from the Makican be ntilized for irrigation purposes in the lerge tract through which the Maki paves, where the depth of water is more than 100 feet. It has already been auggested to have a storage lake. A storage lake is possible in the south of the village of Nandgamadm neor Sastapor, where three small rivers meet. Weter from this lake may be utilized 20 miles for irrigation where wells are carree. It is highly desirable that works of sach a usture should be pravided from the Impeliat funds.
- 10. Drainage Works.—There are many villages in the Kaira district where crops are injured by water-logging, for example, Karsanda, Vadial, Karamead, aome villages in

the Theorem to lake, etc., etc. Additional drainage works, both on sanitary and ogricultural grounds, are necessity to improve the bealth of the people and to incress the fertility of the soil. Fever attacks each and every man in these law-lying places. September and October are the chief months for the harvest of the khorif erops. During these meaths it is very important for a outlivater to match his fields and see that all his crops ore properly harvested and brought home. But unfortunately at this particular time he gets ferer end he is obliged to leave his crops to the mercy of hirds, rate and other sanimals. Sanitary drainage will not only improve the health off the villegers but it will also increase the increme of the land. Drainage works will not increase the Government revenue, but there is certainty of recovering the assessment from the cultivatures profited thereby.

Mr. Beheckar-2 Dec. 01.

- ' 1. Q. (The President.)-I understand that you belong to Kaim?-Yes, to one of the towns in the Kaira district.
- 2. Q. I believe you own property thera?-Yes.
- 3. Q. You say that "In the hot weather crops or watered overy 4th or 5th day !"-Yes.
- 4. Q. You refer, I suppose, to well irrigation ?-Yes
- 5. Q. You have no irrigation from tonks ?- No.
- 6 Q. Nu uhannels ?-Nu. In the Kairo district there on canals. In the Matar taluka tanks are not used for
- 7. Q. Dn ynu consider that irrigation is restricted on account of the deficiency of manure?—I believe that menure is needed, otherwise by annual waterings the suil becomes poor and will not yield a good crop. The soil in Koira is sandy, and without manure good crops cannot be mised.
- 8. Q. Your villago lust an immonse quontity of cattle during the famine?—Yes, for want of fodder large numbers of the cattle died.
- or the cattle died.

  9. Q. What do you think would be the best measure to take to protect this district egainst onether famine F-I have auggested to Mr. Ozanae and to other ufficere that one-fourth of the Gavernment land that paye full essessment should be kept under feedder and grass oad that the load should ha chorged bolf the foll assessment; if the people enlitivate that land then double the fall assessment should be charged so that cultivators will be obliged to grow fodder on the land. The condition of the earlie would then be good and they could till the lands well and botter crops would result than at present.
- 10. Q. Has this ever been done?-No; it has not been
- 11. Q. Would not grass he destroyed by want of rain?

  Nu; I suppose that in the case of each crops they get
  come moisture from the almosphere.
- 22. Q. You eoy "there is great acope for encouraging the construction of wells." Do cultivature find it easier to horrow from the sowcer f—They prefer the cowear to Gorenment, although the interest which Guvernment charges is as law as 5 per cent.; hat they prefer to pay a bigher rata to the sowers because they get money from that sower instantly. If they apply to Government for n loan it takes some time before they get it.
- 13. Q. How lung does it take to get a loan from Government?—Not less than two moaths. The saaction of the Collector is required and other things.
- 14. Q. Has any maner to be paid to anyme in order tuget the laan passed f-I have no personal experience; hot I have heard of many instances of that kind.
- 15. Q. (Mr. Hibetton.)—Two months would not make if a well was wanted and the cultifatur had no hullock to keep?—At present if a cultivator applies in Morch or April he will get the lean in June, which is necless.
- he will get the lean in June, which is necless.

  16. Q. (The President)—Would it be an inducement if Government recovers helf the advance and remits the other hall. Suppose a man borrows 18. 200 and Government hall. Suppose a man borrows 18. 200 and Government half the inducement of respiral to the vell is thoroughly completed and is used for agricultural purposes. Full recovery should be made if the well is not properly constructed.
- 17. Q. lon say that "the water level is too deep." How deep?—Sometimes the wells are more than 100 feet

- deep. At present it is very unsafe to dig a well in this part of the country; quekrand intervenes and does act allow the construction to gu on any further and the ccustruction of many such wells has to be about the construction of many such wells has to be about the country works. Department to the Kaira dustrict have, however, constructed two or three nolls in which this has necoured. They have succeeded in digging such wells in these tractor, therefore I think such wells should be made by the Public Works Department from Impetal revenue.

  18. O. Sannass Gosconment were to make such wells and
- 18. Q. Suppose Government were to make such wells and the oultimater had to pay nothing for them; do you think he would use these wells for calitration?—In the case of deep wells enlivature would not use them. The cattle cannot wark them if they are more than 50 feet deep; pumps or some other means would have to he applied.
- 19. Q. After a well is made it is possible you might not find water?—Yes; last year, which was a famine year, i dag a well in my own fields and found no water; I therefore left the locality and wont 50 feet further and dag another ond there too I found no water. I speed Rs. 1,500 on those two wells and they are worthless. Quickand comes in the way and you can get ne water.
- 20 Q. It would be a good plan if some anthority—the Collector of the district—could make a boring ond say beforehood whether there is water ?—At the time I dug my wells Mr. Quin was the district Collector; he lent me a hering machine that no one knew bow to me it.
- 21. Q. Arey in farour of the extension of loake in the district?—There are sufficient tanks, but they should be deepened and repaired. All the fields are charged sub-soil water-rates and tonk ossessment has also here fired on the surrounding fields. I have mentioned in my note that these lara not been repaired for years. Every year the tanks are allting up more and the capacity for helding water is growing less.
- 22. Q. These are small tonks?—Yes. I om in favoar of hoving more wells, jast like these in Charetar. The people could use onch wells.
- could use oneh wells.

  23. Q. When the waler is not very deep?—Yes; the water is deep only for five or six miles on this side of the river; in other parte yea will find water only 40 or 45 feet deep. Therefare wells should be constructed where they are wanted and they should, I think, he constructed from Imperial rerence. One onns from the grass Imperial revease should be put aside in the Kaira district and placed avergular Irrigation Fund, and from this one onna, wells should he hall unanally where they are most wanted so that the nature of the land will be improved and Government will not be abliged to lessen the assessment.
- 24. Q. When the water is very deep you think that Gorernment abould male the wells ?- Yes.
- 25 Q. When the wa'er is not very deep, say, thurty or furty feet?—Then also Government should make them; if it is left to the cultivaters I am sure they will not make them. They will say "next yeer; now we are all right, why should we hald welle."
- 26. Q. Will they forget the lessons of the famine?— They had lessons 25, 60, and 100 years ego An soon as good times return they will furget the experiences of the famine.
- 27. Q. Yun refer in your memorandu.; to tanks?—I refer to small tanks under which rice fields are cultivated. Such tanks have been leaved to the people; they ares 'ting any and their capacity for helding water is decreasing. When the cultivator wants water for rice there is very little available though the loads under those tanks are charged water-rate.

Mr. Behechar• das.

2 Dec. 01.

- 28. Q. Would you put those tanks under the District Buards or would you loave them as they are at present?—Under the District Boards.
- 29. Q. De you think they would be improved if they were placed under the District Boards?—Yes, ussessment is alresdy charged by the District Buards for repairing such tanks.
- 30. Q. De you think Government can repoir the tanks as cheaply as the people themselves ?—I do not think so, Government repairing will cost double the amount which the people would spend in repairing tanks.
- 31. Q. (Mr. Ibbelsen.)—You would have Gevernment make wells at its own expense where the water is at a ressonable depth?—Yes.
- 32. Q. What rute would the cultivator pay tu Gevernment ?-- Under Rs. 3 per nore, I suppose private owners are charging Rs. 2 an nore.
- 33. Q. You propose that Guvernment should forfeit half its advance if a well is made properly and theroughly ?-- Yes.
- 34. Q. You would have Government charge half the rate?—Nn charge should be made up to the time of the new revision of settlement.
- 35. Q. You say that when Government makes a well at its awn expense the outtivator should be charged a waterrate of Rs. 3, hut supposing Government univances meacy for making a well and remits half the advance, what should be pay?—I say that the water-rate chould be charged scenaricly.
- 36. Q. Would you say that half the rate should be charged when Government remits half the loan f-Yes.
- 37. Q. You think the cost of making a tank is twice us large if made by Gorernment as it would be if constructed by the cultivators?—Yes.
- 38. Q. Would it not cost twice as much if Government made a well?—Wolls require materiels, brioks, etc.; tanks require only digging and the cultivator supplies his uwn lobeur.
- 33. Q. Do you think the Public Works Department could make a well as cheaply as the people ?—I den't coppose so that the Public Works Department makes such wells much more pakka than the people would and therefore the cost is greater. No doubt private individuals could make a well a little less expensively but the work is not sound.
- 40. Q. (Mr. Rajaratna Mdlr.)—In the second case you prepase that Government should make a well and charge nothing ?—Yes, I refer to Inamdans' lands. Government can dig a well in the Inamdars' lands but cannot make n charge for the land in which the well is dug.
- 41. Q. Government would not dig u well and spend mency over it unless the Inaudar vanted Government in do so !—If on Inaudar wanted it, then the land on both sides of the well will get unt of cultivation and he should not be charged.
- 42. Q. Only so much of the land should be exempted ?-

- 43. Q. I thenght you propose that the whele of the land irrigated by the well should escape taxation?—Nu.
- 44. Q. That is not your mouning !- No.
- 45. Q. Supposing there are three acres at land under a well, do you maintain that Government sheald and unity spend money in making the well hat also allow the three acres to he irrigated free of chargs ?—Yes.
- 46. Q. Is not that a very large order upon Gereramont?

  —To extend irrigation covernment should dig wells of four mots so that 20 or 30 nores can be irrigated and the excess water can go to the adjacent fields.
- 47. Q. Why should the Insudar get free irrigation?— Because ground has been brought under the construction of the well and is used by the well; and he will be deprired of the collowation of the crop.
- 48. Q. Therefore the State should exempt him from essessment?—The Inamdur has not to pay any assessment.
- 40. Q. De yeu advocate the reduction of the rate of interest on loans granted by Government?—Yes, tu eacourage the cultivator.
- 50. Q. Would you in that case remit half the ndvance P—Yes, that would induce the people to make more wells—mere complete wells and ne kacheha and unlinished wells.
- 51. Q. (Mr. Muir-Mackensie.)—You think they would not do it unless they got that inducement ?—Yes,
- 52. Q. (The President.)—Would it not also be sufficient inducement for garden cultivation ?—Yes, but gardon crops cometimes fail in the cold weather; in nuc sensen they failed nu account of the insects. Cultivators are not sure of getting a proper return averywhere; but it will induce people to make wells in times of drought and when rain is insafficient for watering the oreps.
- 53. Q. (Mr. Muir-Mackenzic.)—Supposing Gererament made wolls, sarreying the site and paying the cest and charging only the annual bagayat essessment. Do you think that would be an encouragement to the people to make wells?—Yes; but some of the rayats relations may die or there may be a marriage in his family, he may not take the hencit of the water; in that case he will have to pay the Gererament assessment all the same.
- 54. Q. Suppose Government remitted, half, would that be no inducement?—Yes. If they have to pay assessment on wells they will not make them.
- 55. Q. Ie your village de you know of wells made on terms something like those I have described?—Yes, there are many wells there of which Government paid the whole cost. The cultivator makes the well und Government obarge. Lagayat assessment.
- 50. Q. Gerernment does not luke cash assessment?—No. It only charges the matricator for the gross produce in the field. The ground is divided according to certain rules. The charge is. 12, Is. 8 and is. 5 per acre. Government can increase the rates every three years occording to the fertility at the seil.

WITNESS No. 10 .- Mr. P. R. CADELL, I C.J., Acting Collector, Panch Mahals.

Answers to printed questions.

Mr. P. R. Cadell. 2 Dec. 01.

1

- The answers below refer to the Panch Mahals district.
   I have tonred throughout it. The district is divided into
   two portions, distinct from each other in climate, soil, and
   population to a degree which differentiates their requirements considerably.
  - 2. The average rainfall per measem is as follows:-

		Eastern. Inches.	Western. Inches.
June .		. 4.33	ō·22
July .		. 9.82	15.32
Angust	•	. 7.59	8.79
September		4.64	7:33
Oataban		1:04	1.00

3. There are serious obstacles to the spread of irrigation, which are briefly as follows.

Western Division.—The principal objection is the character of the people. The mass of the cultivators are Kolis, extremely lazy and thriftless. The Kundis are good and skilful cultivators, but they constitute under 4 per cent. of the population; and the Rujputs and Malis, who are fair cultivators, are not more numerous. These

olusses toko readily to well-cultivation, and this is the onlyform in which any extension of irrigation is possible. The country is too much of a dead level to allow of irrigation tanks commanding large areas; and, though it would be possible to make large storage works in the hills to the north, the cost of any system of irrigation therefrom would be onermous.

Irrigation is not generally desired by the people because the mintall is nearly always sufficient. There has never heen sente went in this division hefore the recent famine. Only, therefore, the superior cultivature desire irrigation to mise the richer crops.

The greater part of the soil is light goradu, containing much wern lime and granite, and rich wherever at all desp.

Eastern Division.—The character of the population, here, is again the chief obstacle.

The great mass of the population are Bhils, who, though not quite so buy as the Kolls, are even mere backward and thrifties. While the Kuli indulges in opium, the Bhil spends all his spars cash in liquor. He raises in ordinary yeers both a kharif (maize) and a rabi (wheat or gram) erap on the same piece of ground and has sufficient for his

wants. Although failure either of the early or late rain is not uncommon, he is almost sore to get one crep and his assessment is extramely low. Water is ordinarily ptentiful in a country of anter-courses and steep hills. The tanks, however, naturally he in deep holtows, and this fact, with the absence of ony stretch of level ground, would render irrigation from them difficult. It would be easy country to make large storage touchs by hunding up streams, and one is now being constructed.

The lack of capital is quite a minor objection ond, as wells only could be constructed by private means, and he removed by takari grants. The power cultirators require protection, but this has been provided by the restricted tenure.

- 4. No works except wells are constructed by private capitol, and cubanced assessment is not lavied on those.
- 4. No works except wells are constructed by private capitol, and enhanced assessment is not lavied on those.

  5. Loans under the Land Improrement Act were not freely taken up before the scarcity, eimply through the ignoremee of the people about the system and because the sower disansed them from taking Government assistance. The system has now been thoroughly popularised be the gravits during the formine, and the sower's influence has been much weakened. Government assistance will now be readily taken and will be at first necessary for those who has a adopted the restricted tenore. I do not think that any reduction in the ordinary rate of interest is advisable. The nurgin between it (at 6 or 6 per cent.) and the interest on Government paper at 3½ per cent. is not sofficient to nilow of a special ladocement a grant might be made of sums to be taken up, say, within five years, free of interest—in fact a special offer. I do not think ony remission or grant-inadi need to made, except to encourage backward classes who have accepted the restricted tenure, to make wells. Unless they have accepted this tenure any soch remission would be a gift to the sower. I think, as stred below, that boring instruments and blasting powder should be sopphed free; and on necount of the special difficulties of the district, I think, the Collector ought to be empowered to remit in case of failore to find water.

  6. On the routrary, what we want is to obtain cultivators for irrigated tracts, and a colony of Kunble on Medille.
- 6. On the contrary, what we want is to obtain cultivators for irrigated tracts, and a colony of Kunbis or Malls could be uccommedated in occural places.
- 7. There are no canals in this district. It is proposed to make one from the Mondia tank now under construction.
- 23. There is only one irrigation tank in the district, the Malar tank, and the area front it is only 173 acres. The arrange account is from Rs. 8 to Rs. 10 per ocre, and two cups are taken. The best rice (fakhwel) is grown, while the ordinary rice in the di-tilet is of the course kind. The stressment is laried on the whole Irrigable orca.

There is also a small amount of cultivation by lift from village tanks, but this cannot of course be any assistance in nyear of severe drought.

There is room in the Western Division for some extension

of tank-irrigation but not very much for the reosons before

31. (1) The average depth of palka wells is from 15 to 30 feet throughout the district. The rantation is caused by the presence of rock everywhere and the chance whether a spring is found quickly or not.

- (2) The supply is from springs, except in the case of wells erected cose by tinks, where it is by percolation. The wells erected cose by tinks, where it is by percolation. The wells very uncly become saline, but the spring of water is sometimes feebla. The spring woold not be affected by one year of drought; but wells getting water by percolation naturally suffer in dry year.
- (3) The cost of construction is from Rs. 300 to Bs 700, spending on the number of mets or lifts.
- (4) The duration is for about 20 years, when the masoury
- (5) The water is lifted by mote or Los,
- (6) and (7). From 15 to 20 acres are commanded by one ell and would all be irrigated except in years of heavy
- 35. (1) Two crops are taken, succept of course in the case of sogurane. Rice sod what would be the normal crop, the former being watered from the well only in its later stage. Vegetables are very generally raised.
- (2) Sogareace is grown nod also the superior kind of
- rice.
  (S) In a year of ample raiofull the first crop woold not be watered at all from the well; in other years it would of course be assisted.
  - 36. I am trying to get figores on this point.
- 37. Rottings me generally small and calitrated by their owners. In the Western Invision enhanced rent on account of a well amounts in Rs. 20 or Rs. 30 per nere. In the Eastern, permanent wells are not known to have been rented. Only Rs. 3 or Rs. 3 cohsneed rent is charged for a kacheha well.

No enhanced ravonce is charged by Government on oc-

- count of a well.

  38 Serious difficulties occur in selecting the site of a well.
  The depth at which springs are found varies greatly, and
  when found, the spring is liable to run dry. Several of the
  Local Fond wells, though constructed solely for dricking
  purposes and therefore in low-lying spote, are quite dry.
  There are diviners who are believed in hy score. They may
  have some eye for country, but their principal guido secus
  to be the smell of the earth and they are generally franches.
  I do not know what expert advice could be offered, but I
  thiak assistance should always be given by the free loan
  of boring tools and the free grant of blasting powder.

  In the Western Division, where there is black ned me-
- Io the Western Division, where there is black nod me-dinm sail, wells are difficult to construct; but this is not the case, apart from the necessity for blasting, in the Eastern Division, where even kacheha wells stand well.
- Division, where even kacheau wells stand well.

  29. I do not think Government should construct wells in private lands. The better outlivators will do it better for themselve, while beckward ones woold not use the wells properly and would thus find it difficult to pay the necessarily enhanced assessment. It is better to osist the more intelligent of the backward classes who want to help themselves.
- 40. Kachcha wells are unknown in the Western and me common in the Eastern Division They are generally shollow, irrigating from 1 to 3 ners antr. and are coosequently nedess in years of drought. If deepsared, however, they would from some assistance, nod their despening can be made n form of easieted village famine labour. Their extension should, therefore, be encouraged among the back-
- 1. Q. (The President.)-Ton one Acting Collector of the Punch Mahala :- Yes.
  - 2. Q. Ifow long have you been there !- Since April last.
- 3. Q. You know Gujarat well !- Yes.
- 4. Q. You were in Gujarat throughout the last famine? -In early part of the famine I was in Broach.
- 5. Q. Yoor district is one which has very seldom suffered from famine f-Very seldem. The only record of severa famine that I can point to be that of 1790. The eastern part is liable periodically to slight secrety.
- 6. Q. Ifow did you get an in 1877 :- Relief works were opened, but there was very little distress.
- 7. Q. What is the area of your district ?—About 1,595 square miles.
- 8. Q. What is the population:-The population is 265,020.

- 9. Q. Du you know what the loss was doring the last famines.—The reasos shawed a decrease of ubout 16 per
- cent in 10 years.

  10. Q Of the 1,595 square miles there must be large tracts of waste land?—About 60 per cent of the ures is culturable.
- 11. Q. Is there souch distress there now?-There will be more distress this year than last year, but not so severe as in the first year of the famine.
- 12. Q. What do you think would be the best form of pro-tection arminst a future fusion !—It is impossible to sefe-gand the country against famine by irrigation, but it is persible to increase the number of wells to n very limited extent.
- 13. Q. Why is it impossible to protect the country by irrigation?—Because the population is very backward, they would not take advantage of means for irrigating then
- 14. Q. Are they Bhils !- Yes and Kolls.

Mr. P. R. Cadell.

- 15. Q. De they form the helk of your population?—Yes; they compose nearly 90 per cent. of the cultivating
- 16. Q. If they had irrigation works would they not take advantage of them?—They would not.
- 17. Q. Would they if the water were given to them for nothing?—Ne, I do not think so because in ordinery years they get plenty of rain and get a very good yield.
- 18. Q. The scare of the last famine will not change their habits in that respect?—I do not think so, not permonently. It had a tomporary effect on the Bhils who came on the relief works; but at first they would not even. come on the works.
- 19. Q. You say the greater part of the soil is goradu?-Yes; it is light-coloured and highly mixed with gravel.
- 20. Q. Is it fertile?-Very.
- 21. Q. What was the form of relief works?—Principally tank excavotion and enlargement of village tanks.
- 22. Q. (Mr. Ibbetson.)—Existing tanks?—Yes; they ore mainly for drinking purposes, and not for irrigation.
- 23. Q. (The President.)—Io there my demand for wells?

  No, except mmong the better coltivating classes who are only a small minerity.
- 24. Q. The Bhils do not make wells?—Some of them build kochcha wells.
- 25. Q. Among the better class is there my desire for the extension of wells?—Yes; I think the number of wells will increase fairly largely.
- 26. Q. Do they take fakuri advances?—Yes; during the famine they were given large advances, I know they would be willing to take them now. Before the finning they did not know of the system.
- 27. Q. (Mr. Ibletson.)—What was the proportion of the whole oultivating class of the people who took advances ?—Not more than 10 per cent. of the total sultivating cluse. Their holdings were large.
- 28. Q. (The President.)—You say that a well of two or three mots would irrigate 15 neres in an ordinary year? That is a large area?—That would be a well of 2 or 3 mets, 40 to 50 feet deep.
- 29. Q. Would it not be likely to run dry ?-Not in a year of good roinfall.
- 30. Q. Is there any tank irrigation at all ?- There is only one tank.
- 31. Q. I suppose that only irrigotes rice?-Yes, and a small amount of sugaroane.
  - 32. Q. You have a programme of relief works?-Yes.
- 33. Q.—Chiefly for the repairs of village tanks?—Yes, almost entirely. There is one large work at Mowelia going on now and another is proposed.
  - 34. Q. Is that a large tank ?-Yes.
- 35. Q. What is the ecope of the work ?-It will irrigate 5,000 acres.
  - 36. Q. Is the work well forward ?-Yes.
- 37. Q. Was it commenced in the lest famine?—Yes; three and a half lakks have been epent on it already.
  - 38. Q. Whot is it called ?-The Mowalia tank.
- 39. Q. How many people coold you employ on that work if occasion erose?—Up to 10,000; about 3,000 are now employed on it; the canal will have to be six miles leog. The line runs np to Neemnch.
- 40. Q. I suppose the less of cattle was severe during the lest famine?—Very large; we gave Rs. 20,000 for cattle in tokavi last yeer; the people had to bring cattle from the hreeding grounds.
  - 41. Q. Whore are the breeding grounds ?- In Malwa.
- 42. Q. Did the Bhils suffer in respect to their outtle ?-Yee; they enffered severely.
- 43. Q. Are they a wandering tribe?-No; they live in hute, scattered.
- 44. Q. (Mr. Higham.)—What is the culturable area in the Panch Mahele?—About 663,000 nores.
- 45. Q. Is there tonk and well cultivation in the district? There is no tank cultivation; there is only cultivation from wells and that is not more than two per cent.
- 46. Q. Did the wells work well during the famine of \$99?—Most of the wells worked protty well; a few

- 47. Q. I suppose the wells which were made in 1899 dried in the following year? This year they are nearly old dry; this has been a very bod year for wells.
- 48. Q. What happened in the first famine year P-Most of the welle held water.
- 49. Q. I suppose the nrea Irrigated by them was not sufficient to motorially benefit the district?—I do not think it made my difference. The lands irrigated by these wells belonged almost onlinely to the better class of cultivators, and they were not in very great distress throughout the war. the year.
- 50. Q. They did not come on relief works?—No, not the hetter class of cultivators. It did not make any difference to them.
- 51. Q. Did they give employment?—There was no great demand for lebour on the site of their holdings.
- 52. Q. Was the Mowalia commenced in this famine?
- 58. Q. It is not an old tank !- No; the work ie not yet completed.
- 54. Q. When will it be completed?—It will be completed in April if the number of labourers employed on it is 5,000.
- 55. Q. Are sluices being constructed !- They have not heen coostructed yet.
- 56. Q. Has mocey been provided for making thom ?-1 believe so; it is in charge of Public Works Department.
  - 57. Q. The Mulac tank is an old tank ?-Yes.
  - 58. Q. How long age was it huilt ?-Mony years ago.
  - 59. Q. Is it a large one?-It irrigates about 130 acres.
- 60. Q. Is the water in the tank taken every year?-Yes, every year.
- 61. Q. Do they pay weter rate?-Yes.
- 62. Q. Have you a fairly steady demand for water all se vear round?—I am ufmid I cannot say; the Assistant Engineer will be oble to tell you.
- 63. Q. (Mr. Muir-Mackenzie.)—All the cultivators under that tank are Kunbis?—Yos; Kunbis and Molie.
- 64. Q. (Mr. Higham.)—In the relief programme do you enter kachcha wells?—Not in the programme; but grants are heing made for making kachcha wells by fomine relief labour.
- 65. Q. The grant covers the whole cost ?—Yes. A grant of Rs. 50 is made to the Patel of the village, and ha is respoosible for its expenditure.
- 66. Q. Is that amount recovered, ie it troated as an advance?—No. The well is for drinking purposes and not for irrigation.
- 67. Q. Are the wells made specially for dricking purposes only ?—No, the same wells osn he used for irrigation; but they are not called famine works.
- 68. Q. Ie there any objection to calling them famice velief works ?-No, none
- 69. Q. If a man wante to make a kachcha well can he get an advance ?-Yee ; he gets takavi.
  - 70. Q. Hew much ?-From Re. 50 t. Ra. 100.
- 71. Q. The grouts are made to the Patel and he copervises the work?—Yes and he sees that the work is carried out.
- 72. Q. He poys for the lobour hy piece or so mech a head?—He pays so much a head and is heard to employ so many people; he is also bound to keep a rough regleter showing how many people he employed and how much he
- 73. Q. The Public Works Department have nothing to do with it?—No; nothing.
- 74. Q. Con you tell us anything about the expenditure on account of relief works in the Punch hahledaring the last famine?—The figures which I have show that Rs. 4,64,000 hove been spent.
  - 75. Q. These figures ioclude the Mownlin tonk !- Yes.
  - 76. Q. Were other tanks taken in hand ?-- Yee.
- 77. Q. Are they being completed?—Yes; Rs. 1,20,000 have been spent on village touks, i.e., villego works done by

Civil Agency and Rs. 3,40,000 on works done by Public Works Department Agency.

78. Q. The village tanks are ande by Civil Agency ?-

79. Q. Do they hold water ?-They held no water this year, because there was no rainfull.

80. Q. (Mr. Ibbetson.) -- You say that a hig tank is being made now ?-Yes.

81. Q. And that there is a proposal for another ?- Yes.

82. Q. Will the lands they irrigate he held by the hetter class of population?—Yes; the tank near Goonn is in the hands of the better class of the population.

83. Q And the other ?-We have not selected n site for the proposed tank.

64. Q. You think the Bhils would not take advantage of 163. (2. 10a mink the amount of the post in the post of the water free?—They have no experience of trigation, and thay do not want it because with ordinary rainfall they can get two crops from their lands by simply scratching them. In ordinary years I doubt whether they will take to irrigation.

BJ. Q. It comes practically to this, that it is a hopeless ask to try and protect this population?—I think it could be a hopeless task to try and protect them by irriga-

80. Q. As regards the better class you suggest that me o special inducement loans should be made for five years free of interest, you expect only the better class of entire to take taken for wells?—Yes.

S7. Q. Supposing you tried that experiment, do you think a large number of wells would be made?—I think the number of wello in the district will be doubled.

89. Q. What would be the cost of n big well P-From Re, 360 to Re, 700; a good well could be made for from Re, 500 to Re, 700.

89. Q. What area would such a well irrigate P-A well of two or three les would irrigate from fifteen to twenty.

90 Q. What water rote should Government charge ?-overnment al oold charge nothing it the well is made from takaci advances?

21. Q. Government would lose interest and get no recept that it is carried out as n protective measure ?

22. Q. Are there a large number of wells in your district that are not used in ordinory years?—In a year of good rainfall name are not used at all.

93. Q. Have many fullen lato disuse? - No; I do not think so. Twoy do not got brackish in this district.

91. Q. Yon don't think that these wells on which Gar-ernment sacrifices its money fall into disrepair for not being used?—I do not think so, they would be used every second

95. Q. I see that in the Malao tank you charge Rs. 10 no acre for irrigation f.—That includes land assessment.

96. Q. That is a consolidated charge and not merely a sufer-rate?—No.

97. Q. Do you get all your water need at that rate ?-I could not say.

ps. Q. What crops are raised?—There are two crops mised, the ordinary crop would be rice, followed by wheat

29. Q. In the same ground?-Yes.

100. Q. In newo like that, would a man put the whole of his holding ander rice ?—Yes; I believe so.

101. Q. And wheat or gram to follow?-Yes.

102. Q. Is it manared?—Ricecrop is not mach manared, except in the med beds.

103. Q. Whot does a well that has three more co-t?-

101. Q. The rate per acre irrigated by each a well would be from Re. 5 to Re. 7 f-Yer.

105. Q. You speak of boring tooks. Do you mean drills for trial barings:—Yes; they are being tried, but I have an experience of them.

105. Q. flave you but large experience of the takuri system in Dombay :-- Yes, in various districts.

107. Q. Do you think that the 5 per cent, that is charged a advances is any obstacle?—No, I think it is extremely

108. Q. When do rea begin to recover takori; how long after the lean is given?—Generally with the first load revisive collection, in the next year.

109. Q. A well would not be in full working order by Mr. P. that time, the work will not be complete?—I think it would. Castett.

110. Q. You mean to say that it would be completed between the time you give your loan, and the first revenue collection?—The man would not have to pay the first instalment till the next year.

111. Q. Could be make a mesonry well in that time, fit it out and get the erea fully irrigated?—I emaet eny.

112. Q. (Mr. Muir-Mackenzie.)—Is there not n provision in the roles allowing that the first instalment should be postpoaced till the well as brought into working order ?— I am not sare.

113. Q. (Mr. Ibbetson.)—How long do you take to re-over the tatout for wellar—The Collector fixes just linearity

114. Q. Is that the limit nader your rules?-Yes.

115. Q. It cannot be under ten years !- I do not know of ony case

116. Q. Ordinarily you get the whole of the advance back in ten years? - Ordinarily in eight years.

117. Q. I see many people recommend smoll instalments which would make the period of recovery much loager; do you think ten years too short?—I do not think ten instalments acts barshly apon the people.

118. Q. What is the scencity in the case of a takari mat-The man's land.

119. Q. The land to be irrigated?-Yes.

120. Q. You don't demand colluteral scenity ?-No.

121. Q. Scenrity on any other land ?-No.

122. Q. Is the bond registered by which he pledges his had?-No.

123. Q. Sappose, owing to a had year, a mnn meets with failure do you saspend the iastulmento—do you obow him uny lenieacy?—No.

121. Q. Sapposing he does not find water or that he strikes brackish water, is there any provision for romission? -No, act at present.

125. Q. Do you think that such a provision would lead to noort of gamble with Government money. Might not a man say, "If I don't find water Government pays, I don't wish to take acy risk?"—It woold make him more willing to take the risk. I do not think it would be gambling with Government money.

120. Q. On sites which have been approved by Government after trial borings if a well does not succeed, you would remit three-fourths or the whole of the edvance?— I think Government should hear the whole loss.

127. Q. We have been told that people me dolorred from making irrigation works by the fear that they will be arrested enhanced rates; is that year experience?—I bare never heard of it.

128. Q. Do you think the prospect of enhanced assessment enters into their calculations?—I think they are not quite certain of getting their lands which me with the conear or the Maxwell.

129. Q. Do you think that detors them ?-Yeo

130. Q. What is there to diminish their confidence?— The restricted tenore I thluk.

131. Q. Have you any oxperience of Local Board management?-No; I have not.

132. Q. Do you think Local Boards should look after small scattered tanks and that the larger works should be undertaken by the Public Works Department ?—I do not

133. Q. If n new work is made by a private individual Government will not charge on it; and if it is made by the Local Board it would seem only fair that they should get the income?—Yes.

131 Q. Supposing they had an income of that sort rendered available by Government relinquishing to them the revenue; do you think any scheme of that kind would succeed!—I think it is quite impracticable.

succeed?—I think it is galle impracticable.

135. Q. I mm speaking of n else in which Government la not prepared to get the work done by the Public Works Department; the works being too small. Do you think that the Local Bourds would push on the works it Government provided the means. Bo you think there is any hope of their doing so?—I do not think so.

136. Q. You don't think there is much hope in that direction?—No; I think there is not The Local Board is practically under the management of the Collector and the Momintum.

2 Dec Ot.

Mr. P. R. Cadell.

- 137. Q. (Mr. Rajaratna Midr.).—Yon say there are several rivers in the Princh Mahals. Why not utilize them?—They cannot be utilized. Several rivers go through the district.
- 138. Q. There are three rivers in the Western Mahals?—Yes.
- 189. Q. Could none of these rivers be utilized by any means P-I do not think so-
- 140. Q. Kacheha tanks are recommended in your printed note; have you any idea whether they would be of any use in the Panch Mahals?—Yes; one very good tank has already been made this year; they are recommended because they would raise the water-level and be beneficiat in various ways. I think tanks, to a limited extent, ought to be made in the eastern part of the Panch Mahals.
- 141. Q. Considering the characteristics of the people and the fact that your dry crops may well, what would you recommend as the best means of profection against famine. Should kackeka wells be encouraged?—I do not think there would be may effectual protection by them; they are only shallow wells.
- 142. Q. They would serve no purpose in a year of drought?—For one year of drought they would.
- 143. Q. Would people take to the construction of these wells if fecilities were given in the shape of granting leans through the medium of specially appointed officers?—We would have to be very quick about it; it is very difficulty to know whother there will be a drought in the first year of scarcity.
- 141. Q. If you appoint a number of special officers, one for each taluka, could you not prevent famine?—You might.
- might.
  145. Q. What area would a kachcha well irrigate?-A kachcha well will not irrigate more than one to two nercs.
- 146. Q. Won'd that be useful ?-Yes; but you have to be very quick about building it.
- 147. Q. Suppose a patta is given to the rayat guaranteeing present exemption from entineement, and guaranteeing also that at the next Revision Settlement the land though liable to some onlumement on general considerations, based on rise in prices, etc., would not be liable to be onhanced on account of improvoments made by him; would this stimulate the extension of rells?—Yes.
- the extension of wells?—Yes.

  148. Q. Suppose you grant him a permanent patta exempting him from all future enhancement?—That would be a very undesirable principle; it would be putting Govornment to a less to a certain extent.
- 149. Q. It has been recommended by the Famine Commission. Would that induce the people to extend the construction of wells?—I do not think so; there are using rayuts sufficiently provident; it may have some effect, but I don't think it will have much offect. Any such measure is very undesirable in the Panch Malinis, as the assessment there is extremely low.
- 150. Q. In para. 6 of your printed note you refer to colonization. Would it be possible to arrange such colonization in the Panel: Mahals?—In this district Kolis are numerous, and it is very hard to get them to co-operate. We have tried them, but they say it would interfere with their nyat and marriage arrangements; it is very difficult to seems their co-operation.
- 151. Q. (Mr. Muir-Mackenzie.)—What crops are the tanks expected to irrigato—rice?—Yes; and cold weather crops.

- 152. Q. You do not think that the Bhils and Kolis would be induced to take water from the tanks for rice?—They don't want rice, they grow maize to cat and whent and gram to sell. Rice cultivation means more labour and bottor bullocks.
- 163. Q. What class of work would you recommend in the Panoli Malials as famine relief?—I think there is nothing to do, but to arrange for village tanks.
  - 164. Q. Would that soffice P-Yes.
- 165. Q. Don't you think it would be n good thing—just as n metter of experiment—to make some irrigation tanks !

  —That experiment is being made in the Mowalia tank.

  Another tank will also be made.
- 156. Q. On the Mowalia you have Kuubis to cultivate?

  Yes, the land is held by Kuubis.
- 157. Q. Are a great part of the Bhils lands held by Sowears P-No; not much.
- 158. Q. You do not think that the prospects of irrigation would be nifooted by the sowenes P—The sowears would take the lands and gradually these lands would pass out of the cultivators' hands.
- 159. Q. Do you think the sewears would be tempted to bring in good cultivators from antside P-I do not think so; I have not heard of their doing so yet.
- 160. Q. Are there many disured tanks in the Panch Mahals—old ones and unrepaired ones ?—I do not think so.
- 161. Q. Are there any disosed wells in the forests ?—Yes; in one part—Champaner. There the land in the forest is out of cultivation.
- 162. Q. You say that village finks are useful for finding work; would it be equally useful to make long bunds ?—I think they would be just as aseful as village tanks; because village tanks are used for drinking water, and storage tanks could be used for drinking purposes.
- 163. Q. I mean long bunds like those you have in Anand and Vitumganan to hold up surface water for wheat and irrigate rice below?—That would only be possible in the Western Mahals, where the country is level.
- 161. Q. Within that country they might be used?—Yes; I think they might be used.
- 165. Q. Have you may suggestions to make no regards providing greater facilities for taking takani advances?—I think they should be given with greater expedition than at present.
- 166. Q. That would require the maintenance of a considerably larger establishment than exists?—No; one or two more Karkuns from the kacheri of each talaka.
- 167. Q. Could not the Circle Inspectors distribute takari?
  —They don't give takari at all, they simply inspect works.
- 163. Q. They make inquiries us to the scenity of the man?—No; not the Famine Circle Inspectors. That is done by the ordinary Circle Inspector.
- 169. Q. They lave done it in most cases since the famine came on ?-Famine Circle Inspectors did.
- 170. Q. At any rate do you think they would be usefully employed in making these inquiries, or do you think that the work should be left to other officers?—I think it would be better for the Karkun to report direct to the Mamlatdar.
- 171. Q. Havo you seen water-logging in the Pauch Mahals?—Never.

Mr. K. G. Desai. WITKESS No. 11 .- Mr. K. G. DESAI, Executive Engineer, Kairs and Panch Mahals.

Answers to printed questions.

2 Dec. 01.

GUJARAT.

Paragraph 2.

- (a) Proportion of land protected by irrigation works.
- (b) Character of soil.

KAIRA AND PANON MAHALS.

Nil.

Kaira District.

Mostly sandy from decomposed gueiss, sand stone, quartzite, slate, &c. In parts of Minn and Thasra, there is a little black soil from decomposed trap. The sandy soil is very porons and allows water to seak in quickly. It is, however, very fertile.

Panch Mahals.

The soil is similar; parts of Kalel and Halel have black soil from decomposed trap, the great Panaghad hill being trap.

Koira District.

(c) To what extent is cultivation dependent on artificial irrigation?

(d) Rsinfall.

(e) Is there ordinarily n demand for water in Gujarat during south-west monsoon?

(f) What are the crops which require irrigation?

#### Paragraph 3.

- (a) Do small tanks constructed in black soil hold water ?
- (b) Can high earthen dome be made of black soil without macoury core walls?
- (c) When the land irrigated is black soil, is there any demand for water during seasons of average rainfall or only in case of prolonged drought?

Paragraphs 4 and 5.

4 (a) Any other possible sources of irrigation?

Paragroph 6.

(a) By whom were village works constructed and con-

(b) Is any irrigation tovenne realized?

(c) Value of such works as concerning village watersupplies for men and cittle without reference to irrigation. Paragraph 7.

Paragraph S

(a) Tracts in which lands or crops are injured by mater-logging or excess of water in very wet years.

Inrag.aph 0.

Paragraph 10.

(a) Districts for which programmes have and have not

been prepared.

(5) Examination of programmes, etc.

(c) Arrangements for maintaining or completing programpies.

In north Matin and part of Mehmudahad Taluka, rice crops are assisted by water derived from the Khuri river. The works are in charge of the Executive Engineer, Ahmadahad.

Panch Mahals.

Some of the village tanks and that at Mainr supply water for rice crops, but there is no systematic irrigation.

The Agricultural Department will give the statistics. It was not supposed to have failed any time before either in Kuira or the Pauch Maisis for a century, but in 1809 monsoon, there was only about 7 inches and even grass did not graw. 1900 and 1901 have also been bad monsoons.

Rico fields near tanks take a little water when the late rains are insufficient in both the districts.

Rice crops.

No, mixed constructions are also not believed to be sound, and thus where proper material for earther hunds is not obtainable, masoney down are the only alternative.

Usually no demand. If large canals are constructed, demand would be created for rubi and sugarcanc, etc., particularly in the Knira District in which the soil is very rich. In the Punch Muhhls, the cultivators are Bhils and there will probably be no demand.

The Executive Engineer, Ahmadabad, can give luforma-on for Kaira. There is no irrigation work in the Panch tion for Mahals.

For Kaira, the project of making a cauni from the Mahi is under the consideration of the Seperintending Engineer on special daty and he will give further details. Panch Mahis. If expense is no consideration, sites for large tanks may be found, but they will not pay even working expenses in ordinary yours.

They were constructed in former days by the village community. Latterly the District Board has been spending money for improving water-supply tanks. Government in the Public Works Department have spent no money in the Knirn District. One tank, viz., tank at Alelax, was repaired at a cost of R2,865 in the Panch Mahhis from Imperial Irrigation. The sam of R55,170 was also spent on it in 1899-1900 and 1900-1901, as famine work for clearing silt from Famine funds.

The sum of R898 is realized as irrigation resenae in Kaira District from the Chanvaya Tank and R1,529 in the Punch Mahals from the tank at Malav.

They are useful for water-supply, ele.

The Collector can answer the question. There is no probability of artesian wells being successful in the Kuira District.

In the Paneli Mahala a very enreful examination of the geological structure will be assessary as there is a great variety of strata in the different talakhas. None of the out-crops seen by me are, however, of persua materials.

The south-west corner of the Knira District, that is, parts of Borsad, Anaud and Mhar, suffered from being water-logged in former years. This was partly remedied by the construction of the Anand-Mogri drain and lately by the Karamsad drain, and two drains in the Matar Talaka, the arts of water-logged lead is up per two statements attached, but no remissions are known to have been made. No part of the Panch Malabis is water-logged.

The statement of classification and expenditure of famine works for Kuiro and l'unch Maháls is herewith sent. See note to the statement for their usefulness, etc.

Famine programmes have been prepared both for Kaira and Panch Mahals.

Copies will be shown personally.

There is no special arrangement. The usual district establishment is required to prepare them and maintain them.

It would be better if special establishment la each district be appointed for the purpose.

Mr. K G. Dezas. 2 Dec 01. Mr. K. G. Desai. Statement showing water-logged area relieved by the construction of the Karamsad drain.

Desai. 2 Dec. 01.

NOTE -Out of above works, the roads mant completing to be of necessary the cetimates are under preparation. The tanks are complete except the tank at Mewalla and the work is in progress. The last moreon were very bad one and very few of the lanks have water in them.

- 1. Q. (The Precident).—You are Executive Engineer of the Pauch Muhals?—Yes.
- 2. Q. Hore you heen there long?—About three months, I was in this district six years ago for a few years, so that I know the district.
  - 3. Q. Both Kairs and Ponch Mahala?-Yes.
- 4. Q. Whot do you think would be the best measure that Government could adopt to protect this district against a future famice?—I um ufmid it would be u very difficult task to protect this district because at the time when water is wanted most, you do not get it; the rainfull is too deficient; in the Punch Mahals it is errol less than in Kaira. As you go higher up in the Panch Mahals the rainfall is still less and the result is that if a tank is constructed it would dry up; the other difficulty is that the soil is too sandy. sandy.
- 5. Q. Is the ground saudy in Kaira and thu Panch Ma-hals?—Yes, in both places; if snything, the soil in the Panch Mahols is more saudy than the soil in Kaira
- 6. Q. But there is some irrigation?-Yes. This year no water could be hed anywhere. Even as regards the drainings cuts that we made two years ago, people tell me that no water mu through thom.
- that no water rau through those.

  7. Q. Sometimes it hoppons, does it not, that there are very heavy showers—once it begins to rain—und you get quite enough to fill your tanks?—Yes, but we most store up that water ut the head of the rivers or let it run; the head of the river is unostly far off; the Mahi is something like, say, 50 miles above the northern part of the Panch Minhals and unless water is given regolorly to the people they would not utilize it; if it is given to them irregularly, they would not be prepared to use it for the purpose of irrigation, because land has tu he speciolly prepared for irrigation and that cannot be doed in a short time. The only way to improve the country by means of irrigation is to here tanks thut would hold a reasonable quentity of water for two years and then the people would ese the is to nove tanks thus would note a reasonable questity of writer for two years and then the people would ose the water. If such u tauk was made, the canals would be very expensive on occount of the saidy nature of the soil, they would have to be lived with mud concrete. In America they have been very soccessful.
- 8. Q. Possibly they might be made with greet advantage by ntilizing famine labour?—They might; but it must be usfaltely settled beforehand on what lines we are going to proceed. Once a project is seltled, the question will be where we should begin. In the beginning I am afraid these canals will not pay even their working expenses because the people are not necustoned to Irrigation in the Panch Mahalis; they are very poor; they have no capital and they are not used to canal irrigation. In the Kano district the people are better off. I suppose in the course of time, once they get accustomed to the use of canal irrigation, they will take. We it, but for a number of years these canols would probably not pay their working expenses.

  9. Q. The working appenses will have to be considered 8. Q. Possibly they might be made with greet advantage
- 9. Q. The working expenses will have to be considered after the ranal tegins to work?—It comes to the same thing. I remember, in old days when irrigation in the Decan was first started, the canals did not pay even their working expenses, but when people got more accustomed to use the woter the canal showed better results.
- 10. Q. If the causes were used?—Then we would be somewhat better off than we were in 1869. In u year like 1899, unless the tanks were made to hold a two years supply, we would not be any hetter off. The rainfall in that year was so slight that there was very little water in the tanks. This year the rainfall was below normal—14 meches—and it enabled people to get their kharif crop. It came in small driblets; it would not have alled the tanks.
- 11. Q. It is not always so? No, we get it in that way in had years.
- 12. Q. Suppose fomine were to come ogain, what is the hest means of protecting your district against it?—We are trying to find sites for tonks in the district, for the construction of new tanks and ne are charing old tinks, that is the heat means of protecting the country against future famine.
- 13. Q. You think the construction of tunks the best thing that can be done !- Yes, for the present. Rehef projects should be specially prepared beforehand.
- 14. Q. Have you tad much experience of irrigation matters in famme years?—No, very lutle. I was for about a year and a half in the irrigation branch; but beyond that the rest of my service has been in the reads branch.
- 15. Q. Do you keep up a programme of relief works in your office?—Yes, we have one.

- 16. Q. Far how many people have you made provision?—At present we have made provision for only about 20,000 reople. This programme was made in Moy last. After the twn years of famine that we had, I suppose, they do not think there is any likelihood af unother famine. On looking up my records I see that some works which were proposed at one time were not begun and that some works were commenced but not completed.
  - 17. Q. You have made provision for 30,000 ?-Yes
- 18. Q. How many were employed last year ?-Oo irriga-on works the number was about 40,000 to 50,000. I am only speaking from hearsay: I was not in the district then.
- 19. Q. (Mr. Higham).—Under whom are the irrigotion works in the Karn district?—They are managed by the Executive Engineer, Ahmedabad.
- 20. Q. That is only a small area in the north of the district?—Yes.
- 21. Q. You have not got a storage tank?—No, we have got a large number of small toaks. They are all under the Revounce authorities. The revenue is collected by them. There was some idea of putting these tanks into repair, but the work has not yet been taken up.
- 22. Q. The Public Works Department does nothing?—
  No, there was some correspondence between the Public Works Department and the Revenue Department. I think the original list contained 1,000 tanks both lorge and emell; the Public Works Department could not possibly take them all np. They wanted to know how many of them were big enough to be worth taking np and repaired. I think the list was brought down to 120 tanks; and the Public Works Department was waiting for orders when the famine came and some of these tanks were repaired by famine jabour. by famine labour.
- 23. Q. Wem all these 120 tanks repoired during the last famine ?-1 could not say: we have repaired a good mony of them.
  - 24. Q. Have you got a list of these 120 tanks ?-Yes.
- 25. Q. They were irrigation tanks P-Yes, they oll irrigate more or less land. We here a definition for large tonks which is as follows—"all tanks giving a revenue of more than Rs. 30."
- 26. Q. What you call revenue is water-mis ?—Revenue on lands affected by these tanks. I um only soying this from what I have heard; it is not on my records. I have heard this definition.
- 27. Q. All those tanks are old tanks ?-Yes.
- 28. Q. There is no water-rate charged on lands under them ?—No.
- 29. Q. Water-rote is put on now tanks?—It is a sort of water-rate; our rate is collected for every aere actually irrigated.
- 30. Q. You feed a great number of these rivers P—Not many; some of those are so fed. You feed o great number of these tanks from
- 31. Q. Do they over fail?—They have done very hadly this year. I am told that in Saharmott there was not more than seven feet of water.
- 22. Q. Has there been no irrigation P.—There was what is called Kharl cultivation in the northern part of my district where there is on irrigation canal. The canel is made on the Khari river and it feeds some of the tanks.

  From these tanks the people irrigate. One of the famine works which I have just started this year is the construction of a large reservoir to collect canal water which is wanted by the cultivators.
- S3. Q. You say that some of the large tracts of the Kaira district are water-logged ?—Yes, they are.
- 34. Q. They have become water-logged within the last two or three years when there was no rainfall f—No, they were water-logged in years of heavy rainfall. In 1900 we made drains which carried off the water and the villagers approved of our plans. In July 1900 we had one or two rather heavy showers and it only filled the channel, which carried off water. It did not rise high enough to fill tanks.
- 35, Q. Where is it carried off?-Into the Gulf of Cambay.
- 26. Q. There are no tanks f-There are tanks, but they are mostly at a little higher level; and drainage has to be neressarily at the lowest level.
- 37. Q. Do you call them irrigation works?-That is the clossification in our books.

Mr K G

2 Dre 01.

- Mr. K. G. Desai. 2 Dec. 01.
- 33. Q. Were all those tanks in the Kaira district cleared by the Public Works Department or as Civil Works?—They were cleared by the Public Works Department. The work done by the Civil Department is not included in my list.
- 80. Q. As regards tanks in the eastern district of the Pauch Mahals, there are plenty of Public Works Department tanks P—Yes.
- 40. Q. Where is that, in the lower hills?—Yes; the land is very much out up, owing to there being many raviues. It is a rocky area consisting mostly of linestons. There is some chance of keeping water if it is fonad; in the other part a reservoir can be easily constructed and will probably hold water.
- 41. Q. And on the western side?—We can make tanks, but there is great doubt of their holding water; there is no rock; the ground is sandy.
- 42. Q. Were you in charge of the Mowalis tank?—No; there is mother Relief Engineer in charge of it; it is not complete yet; but I think during this famino, they will probably be able to complete it.
  - 43. Q. You have nothing to do with that !- Nothing.
- 44. Q. Rs. 2,03,090 was spent to deepen that tank ?—It is for the water-supply of the town and for irrigation.
- 45. Q. Have you seen the Mowalia tank?—No; I have only been in the district three months.
- 46. Q. Do you know how much they have deepened it ?-I have no idea.
- 47. Q. (Mr. Ibbetson).—Are there considerable forest areas in the Panch Mahals !—Yes.
- 49. Q. In preparing your programms of famine works did you consult the Forest Department as to what suggestions they have to make ?—I did not.
- 49. Q. I understand you prepared this famine programme?—It is partly prepared by the Collector; the Collector and the Executive Engineer consult together and prepare the programme. The revised programme, I think, was propared in consultation with the Relief Engineer and the Collector.
  - 50. Q. In your time ?-No.
- 51. Q. Are any forest works contained in the programmo?—Not unless the new roads that are being made have to pass through the forests, may be considered forest roads.
- 52. Q. If there are forest roads would they help the forests?—They would certainly help the forests.
- 53. Q. They are used for forest purposes only ?—No; they are used for forests as well as for general communication. The reads chosen are such as are wanted to connect different places; they would help the forests and the general public too.
- 54. Q. Is any clearing of the jungles included in the programmo  $P\!-\!N\sigma$  .
- 55. Q. (Mr. Rajaratna Mdlr.). In your note to the Engineer on special duty you refer to tanks in the Kalol talnias—were they made to benefit the forests?—I am not aware that they were made specially for the bonefit of the Forest Department.
- 56. Q. In answer to Mr. Higham yon said something about the repairing of tanks yielding Rs. 30 f—It was not the cost of repairs; it was the amount of extra revenue that was derived by regulating the demand for water in these tanks. But for the existence of these tanks these, lands would have remained unenlitivated; owing to the existence of these tanks a certain number of fields are paying a higher rate of assessment. Government at one time took up the investigation of tanks which were used for irrigation and those which required to be repaired or put into good order were ordered to be repaired by a Government Resolution, and only tanks that gave a revenue of Rs. 30 were taken up by the Public Works Department.
  - 57. Q. They were old tanks ?-Yes.
- 58. Q. In para. 8 you refer to certain water-logged lands. Are these lands left unenlivated in consequence?—Some of them are not.
- 59. Q. Is the out-turn affected? A part of the land went ont of enlitvation altogether, but some of those water-logged lands were taken up by the people for grass. There

- are also lands which in a year of a very heavy rainfall would be water-logged and could not be used for cultivation, but in a year of short rainfall are dry and are used for rabi crops.
- UD. Q. Practically they have not suffered seriously ?-
- 61. Q. (Mr. Muir-Mackonzio).—As regards these water-logged lands in Kaira which you showed me the other day, the offeet of the drain this year has been to carry off what little water there was in the land. Is there say remedy for that P—Yes, by putting regulators on the drains—putting cross bunds with slaices in them.
- 62. Q. That would not be a difficult or an expensive operation ?—No, not at all.
- 63. Q. In that way you would make the drains useful in both dry and wet years?—Yes; in 29 years out of 30 they would be very useful.
- 64. Q. You would advocate, as a suitable famine work in the Kaira district, the digging of new irrigation tanks for rice cultivation?—Certainly, where there are suitable sites and where you have a fair chance of filling the tanks.
- 65. Q. In other places you would not construct irrigation tanks?—No, there are no good sites for tanks, the leakage will be heavy.
- 66. Q. I believe projects for two large tanks are under consideration?—I have not seen the sites; and I nm not able to judge at present whother they should be taken up or not.
- 67. Q. Do you think some of these tanks should be fed by a river in a year of no rainfall?—My opinion is that some of them will not fill at all; but I think if reasonable care is taken they should fill.
- 63. Q. As regards the tunks under rice onlivation for which a special assessment is charged, how are they working?—All the older tanks are generally below the level of the country and most of the cultivation under them now is by lift.
- 69. Q. In a year of good rainfall?—It is for a short time by flow but mostly by lift.
- 70. Q. Would not the construction of such tanks as famine works be at least as useful as any other kinds of work f-Yes.
- 71. Q. And would it not also be a fairly chorp famine work?—Yes, if you could find good sites for tanks which could hold good water and which could be protected by bands.
- 73. Q. You would prefer roads?—Yes, if they are wanted. In the last famine three roads were taken up. I should like to see them completed. I am not in favour of starting new roads as further expenditure is required to put them in good order.
- 78. Q. Sooner than start now roads you would have these inferior tanks?—Yes, I should prefer them.
- 74. Q. Would they have any effect in substituting an area of rice caltiration for one of dry cultivation?—Probably they would have that offect, but in most cases they would have a rather peer chance.
- 75. Q. Would that swe rice in a year of somewhat inconsistent rainfall?—Yes.
- 76. Q. How much will a well forty feet deep cost ?-
- 77. Q. How moch would a cultivator be able to do it for ?—He may be able to do it for Rs. 100 less.
- 78. Q. I suppose his work will nat be nearly so good !--
- 79. Q. How long will a well built by the Public Works Department last?—With slight repairs it may last for centuries or it may give way a few mouths after it is made. It depends upon the man who makes it.
  - 80. Q. It would last a profty long time f-Yes.
- 81. Q. Would it irrigate well?—It would not be a failure, but at the same time it would not be very good.
- 82. Q. It would go in twenty-five years?—There are so many factors to be considered before answering such a question.
  - 83. Q. It would go rather soon ?-Yes.

### FIFTEENTH DAY.

# Ahmadabad, 3rd December 1901.

WITNESS No. 12 .- Mn. P. R. Munta, Deputy Director of Agriculture.

# Answers to printed questions.

- 1. The answers refer to the Province of Gujarat, where I have served for the last seven years as Survey and Settlement Officer.
- 3. There is no obstacle to the extension of irrigation arising from the cases mentioned, except in parts where the black cotton roll prevails.
- 4. Under the Bombay system, enhancement of assessment would not take place on account of works constructed by private capital, nor any exemption is given.
- 5. For the encouragement of leans under the Land Improvement Act, I would resommend-
  - (1) Interest at 5 per cent.
- (4) Total remission in one of failure of the attempt to obtain water or oo obtaining salt water, and remission of august distallments in case the well runs dry or turns brackish after its completion and before the lam is paid up.
- (6) Small onnoal instalments of repayment will be greatly appreciated by the people.
- 6. No big irrigotion work has been projected in Gajarat to produce the effect of depopulating unirrigated tracts, and no such project is under contemplation.
- In rice-growing tracts, people evince a strong desire to have the existing lanks improved and new enes dug.

B.

There is no canal of continuous flaw in Gujarat. If such a canel were saccessful in Gujarat, it would add about Rs. 50 per acre per annum to the net carnings of the cultivators.

c.

There are two small causls of intermiltent flow—Khari sluces in Kaira and Kharient in Ahuadabad. They supply mater during the mensoon, and no chiefly utilized for rice coltivation. They do not maintain their full supply during the years of scauty rainfall, and in the famine year they tailed allogether.

13. Irrigation will increase the value of produce of land under auch canals by readering it passible to coltivate two harvests. In a year of good rainfall, such lands will grow rice followed by rat or gram, wheat, barely, etc., according to the lecality. The second crops are possible, it there is sufficient late rainfull and the canal holds aut till October and November. As a rule, however, in Ahoundabad superior variety of vice is grown, which matures late in November, and a second crop is not often possible.

The yield of rice depends upon the position of the rice beds.

Rice beds situated higher up and neerving only the rain mater will yield about 18s. 20 to Rs. 25 worth of produce; these situated lower down receiving the occumulated water of the higher levels, will produce a crop north about Rs. 30 to Rs. 40; and these receiving cause or tank water, in addition, will produce a crop of superior rice or of inferior rice and a record crop of rai (Dolicios lablet), etc., worth Rs. 50 to Rs. 70.

The produce will be nil in the first case, and reduced to less than half in the second and third cases in o year of scanty minfall: in n year of drought there will be nn erop in all cases.

- 14. It will not be possible to grow rice when the mouseon barets too late. The rice seddlings will be teo far matured to be fit for transplantation. If rice cannot be transplanted, enother crop will occupy the rice beds, provided there is ample rain at the end of the scason. Too early execution will reduce the yield to almost nothing.
- 15. Irrigation from canals, which work only during the monocon or from small tanks which are also utilized only during the monocon, is applied only to rice crop. Such a crop is not generally irrigated from wells in addition to canal or well. A very small need in Sunt is irrigated from tanks, and later on in the year from wells when sugarcane is cultivated.

- 16. Please see 13.
- 19. As irrigation from canals or wells has not been carried out on any extensive scale, no answer can be given from experience as regards any damage resulting from it.
- 22. Private enusis do not exist. Canals are not possible in Gojarat: only two projects have been monted by the Poblic Works Department in past years.

D.

- 13. As in the case of canals so in the case of tanks, irrigation refers only to the rice crop. Tanks in Gajarat are small village tanks, which fill up during the rains, and no water is available for irrigation after the essention of the rains. The area irrigated is from a fraction of an acro to about 100 acres. Average meas for each district are given in Table V of the memorandum prepared for the Commission by the Director of Land Records and Agriculture.
  - 24. Pleaso see 13.
- 25. Please see 14.
- 27. Please see 13.
- 28. No separate charge is levied for tank assistance: it is included in the land assessment. The assessment is levied on the survey number or the recognized share of the survey number, and is charged, whether it is irrigated or not.
- SO. No annual charge is incurred on the repairs of tanks. All that is required is to dig them deeper when they silt up. In the black soil districts, such as Sunat and Broach, such repairs are needed every 20 years. In Kaim, where the light soil (goradu) prevais, the tank silt is utilized for manuring adjacent fields, and no such repairs are needed.
  - 31. Tanks are not constructed by private persons
- 33. It is not possible for privale persons to construct

#### E .- Welle.

34. In Sprat the average depth to the water is 20 feet in garden lands, and from 30 to 40 feet in other soils; in Breach the depth is 45 to 60 feet; and in Kaisa the average depth is 35 feet, but in places it goes down to 35 feet and even more. In Ahmadabad the depth is the same as in Kaira. In the Kalol sub-division of the Panch Mahals and in the villages of Godhra, adjoining Kalol, the soil is gorat and the depth to the water is about 30 feet.

gord and the depth to the water is about 30 feet.

In the western portion of Godhra, seanty woter is obtained at a depth of 20-25 feet, beyond which solid stone is met with, making it expensive to go farther down. In Jhalod the water is deep and scarce. In Dohad the wells are made in low-lying fields, and scancy supply is obtained at a depth of 20 feet, beyond which took is met with. The areas where wells are liable to fail or become the saline are difficult to particularize, but such information exists in regard to each ozisting well on survey records. It may, herever, to generally stated that sufficient water of good quality is met with throughout Surat, except the Monda's taluka. In Proach (excepting Ankleshvar, where the conditions should to Surst prevail), the supply of well water is seanty, as a rule, and simutimes brackish. In Kaira the tract known as charden, comprising the talukatof Anand, Horsad, and Nadiad, the well water-unply is generally plenty, and of good quality. The same conditions only to the acrust tracts of Ahmalabad. The average cost of construction is from Ris. 500 to Rs. 700. Wells last 50, 100 or more years. Water is raised by leather large.

Wells exist in cultivated fields, and there is eaough area to which irrigation could be extended. The average area schooly irrigated from a well could not exceed two area.

25. It is difficult to compare the values of irrigated and men-irrigated c.ops. The crops irrigated from wells are sugarcane, yams, turmeric, ginger, potatos, sneet potatos.

Mr. P. R Melda

Mehta.

Mehta.

Dec 01.

Dec 01.

Mehta ouious, chillies, and vegetables. But these crops are generally grown ou rich lunds, and the figures given below are uet meant to apply to hiack soils or to soils of pour descriptions. It may be stated that the cultivation of these crops leave a net profit of shout Rs. 50 per acre. Sugarcano is the most important of the irrigated crops. The net profit resulting from it is Rs. 100 and upwards. In addition, it was the resulting throughout the ways to the cultivation. it provides work throughout the year to the enlivator and this hillocks. In Gnjarat, although sugarcane occupies the field far 12 months, it is really a two years orop, as, although the cause are planted in December—January, yot, the field has to be mannred and got ready during the previene monsoon months.

A dry-orop rotation will yield an ennual produce worth Rs. 20 to Rs. 25. In case of better soils and apporter tillage, the value will rise to Rs. 40 per acro. Cultivation charges in case of sugarance amount to Rs. 400. In case of other garden crops, the cultivation charges come to Rs. 100 to Rs. 300 and the produce to Rs. 150 to Rs. 350 and more.

In a year of scanty rainfall, the value of a dry crop will be reduced to Rs. 10 and less, but if irrigated from n well will rise to Rs. 20 and more per acro.

In a year of ample minfall, the produce will not be much affected.

In a year of drought, the produce will sink to nil, and if irrigated from a well, it will rise to Rs. 15 and more. In addition, a fodder crop could be grown which can be valued at Rs. 20 and more per acre.

37. No oxtrn rate is charged for wells under the Bombay eystom.

38. It may be said that serious difficulties are not eucountered in the selection of a spot for wells. In tracts, where it is uncertain, whother the water will he sweet or sult, the preliminary expecditure in ascertaining the same will not exceed Rs. 20, which, if oncouragement af well construction is desired, shall be met by Government in case of failure.

No seriona difficultice are encountered in the construction

No assistance has been, up to as late as the last month, affered by Government in the shape of expert odvice. The Honourable Mr. Lely has, however, lately arranged to supply Mamlatdare with boring tools. I am respectfully of opinion that expert advice is greatly needed with regard to borings. But it does not exist. No officer is accuminted with the focts and figures in connection with borings. The people have used being tools. Wells have been bered up to 20 to 30 feet by people with success. But they have not been able to go deeper for want of knowledgs on the subject. Welle have been bored successfully in Surat, Kaira, and Ahmadahad. In Broach, where there is a general scarcity of water and the supply in many villages not quite entition to reven the domestic needs of the people, n well in a spinning mill dug to the dopth of 120 feet produced an ample supply for the hollers, and the water level is maintained at ahont 40 feet. I am respectfully of apinion that an officer should be put on this work, who will study all the existing facts, provide being tools and a competent mechanic wherever required, and facilitate the work generally. I am confident that people will willingly pay all reasonable costs, if the hring turns ant encessfal. In the heginning nt least they should not be charged in case of failure. As all the extra help will be provided by the owners of wells, the costs te Government will not be high.

Character of Soils.—Breadly spenking, there are two varieties of soil prevalent in Gujarat: (a) the black cetten seil, and (b) the gorat or light coloured soil. The former may be termed cluy loam, and the latter sandy loam. In the Surat district there is mother class of seil called the Surat district there is mother class of seil called garden or bagayet soil. It occurs in patches. Here garden enlitivation is carried on par excellence. Sugarcane, ginger, turmeric, rice, eweet pointoes, chillies, yams, etc., ore the ordinary crops grown. Irrigation is hy wells, except in onse of rice, which is from tanks In anden soils water is faund at not deeper than 20 to 25 feet. Small pakka (brick and olunnam) wells are constructed, costing from Rs. 150 to Rs. 300. As a rule enflicient wells exist, and no great demand for taking advances exists in such nreas. There are other kinds of ecils known by various local names; but they fall, broadly speaking, into oce or the other hend of the two chief varieties noted above. Generally these varieties are inferior to what are strictly Generally these varieties are inferior to what are strictly termed block or gorat lunds. On river banks allavial or bhatta soil exists in patches. Those are subject to inundations and are not fit, therefore, to grow a twelvs-

mooth erop such as sugar cane. They grow tobaccomixture of jowari, and other crops. They are never mixture of journi, and other crops. They are never irrigated, because the crops they grow without the aid of irrigation are highly remunerative. Besides the river may be tidal, and irrigation is therefore an impossibility.

As regards their suitability for irrigation, gorat soils excel all others (except bagayot lands). Irrigation is not practised in black catton soil. The black soil prevails in the Surat and Broach districts: gorat in Kaira and Ahmsdabad. In the Panch Mahals, the Kalal sub-division is gorat: other talukas have interior black soil. The low-lying fields of Dohad Mahal are, however, very fertile.

Crops grown under Irrigation .- In disensing crops grown under irrigation, a sharp line has to he drawn hatween the rice crop and all others. They must be discassed separately, as the conditions under which they are grown are quite different. First as regards rice crop.

Rice is grown in all parts of Gujarat to a smaller or larger extent. Rice is irrigated from tanks. Tanks are small village tanks, and a few beds of rice from a fraction of an acre to, say, about 100 acres (as many ac the capacity of the lauk will allow) are cultivated under cach

Other irrigated crops, each as eagarosne, yams, ginger vegetuhles, otc, are irrigated from wells.

Rice crop requires water throughout the monsoon for its successful cultivation. The more the water, the better the crop. Sugarcano requires water during the mossoon, only if there is a long break. The distribution of water is cantrolled by the villagers themselves, and the water is takon in torns from the tanks. In case of rice, the tank water assistance is ossimilated into the laud assessment. Both are separately shown in survey records. But for the purposes of cellection, only the total assessment appears on the revenue records.

Tanks can he canstructed in almost all soils. Black soil holds water better than other soils. No masonry cere is useded. Tanks are utilized for rice cultivation, and tank water is ntilized every year. As noted above, larger the supply of water, batter the erep. Therefore, there could be no falling off in years of fair or good rainfall. As explained ahave, the revenue can show no falling off under the Bombay system. Construction of tanks in clack cetten soil or soil of any other description in localities where rice is grave, will increase the outtiration of rice. Rice group is grawn will increase the cultivation of rice. Rice crop is a paying crop. Tank assistance can be charged. Therefore, the construction of tanks is profitable both to Government and the people. In Broach and some talukae in other districts, no rice extension can take place. Rice depends for ite eucersiul cultivation on manure; mauuro means addi-tional keecing of cattle; eattle cenuot be maintained unless grazing lauds exist; and in Broach no such facilities exist, the whole area being under cultivation. Basides rice requires a large surplus population of lahourers at the time of transplanting and harvesting, which does not exist in Brosch. In the Jambusar taluka of Broach, inferior rice is grown on dry-orop lauds, and all over Breach, except near the eea coast, inferior rice is grown between the rows of cotton orop, when the black cotton soil field is kept fallow during the previous year. Such rice oultivation is done on a small scale, and does not affect the general remarka made nhont the district as regards the policy of extending tank irrigation for rice cultivation.

Wells .- In the Snrat district the prevniling soil ie black and wells will only be utilized during a severe famine. The depth to the water varies from 30 to 40 feet. In blandy talaka from 40 to 60 feet.

In Breach the prevniling soil is black and of a stiffer enture than the Surnt black soil. The difference between the two will be apparent, when it is stated that jowari (Sorghum vulgare) is grown as mouseed erop in Surat and as a rabi ctop in Broach. In fact, except rice, no crop is grown in the black soil of Broach which matures between October and December. In Broach the depth to the water is 45 to 55 feet. The supply of water is scanty. Wells no is 45 to 55 feet. The supply of water is seanty. Wells not huilt on the bank of the village tank to supply the domestic wants of the villagers.

The part of Gujarat where well extension will be most succossful is what is known as charotar, coloprising the talukas of Anund, Bersad, and Nadiad in the Kaira Collectorate. It is well known for ite fertile gorat eoil, and the skill and intel-

<sup>\*</sup> Tanks silt up sl-wiy. Excevation every 2) years would be desirable in Surat. In Keira and Ahmadabad the gerat coil is benefited by meaaring with tank earth. Excavations here ere therefore celdom found necessary, as the lenk silt is remared by the people to manure adjoining fields.

ligence of its cultivators. It is one of the most densely populated tructs in India, and the land is very much sub-divided. This may offer some difficulty in the extension of well construction. Hat people are accustomed to pay for the wee of wells to neighbours, and means may be devised to build wells under a joint partnership. Joint purtnership in wells exists, and when a piece of land possessing a well, held hader joint partnership is sold, it passes hadds subject to such cacumbrance. Here irrigated crops, elleft fodder scops, were grown extensively dailing the last famine, both from pakka and lackela wells. The depth to the water is 30 to 40 feet, hot in parts it exceeds 60. In ordinary years, wells are mostly utilized to woter the tobacco crop, which reduires about two wateriogs after the cessation of the rains. Heachish wells containing the valuable salt of potassiom nitrate are found and are coosidered valuable for tobacco irrigation. In the Ahmadahad district there are gorat tracts to

In the Ahmadahad district there are gorat tracts to An the Annuages district faces are good tracts of which the same conditions upply as those marrated it case of charcter. But in many parts of this district well extension is not possible, because the water-supply is scant; and brackish to rail, and owing to the premience of black sile.

In the Pench Mohals, the taluka Kutel and the adjoining villages of Godhra have gorat sell, and well irrigation is practised by the superior class of cultivators—the Patridors. rillages of counts are parties class of cultivators—the l'attidora. Ahundant sopply of water is chimined at a depth of shoot 30 feet. In eastern parts of Goodbara, a scanty supply is obtainable at a depth of 20 to 30 feet, boyond which rock is met with, and the propla have not the means of blatting and deepening the wells. The soil also is poor and not suited for irrigatiou, unless beavily monured. In Dohad and Jhalod the surface of the coentry is undulating. A scanny supply is obtainable in Jhalod in low-lying fields at a depth of 20 feet, after which hard stone is met with. In Dohad the supply of water is scanty, and, as a rule, very a depth of 20 feet, after which hard stone is met with. In Dohad the supply of woter is scarty, and, as a rule, very deep. In Halol the soil is either black or stony and shallow. The cultivators are mostly Bhils, and are not likely to take advantage of wells in famine years even where there may be a sufficient supply. On the whole it may, therefore, he stated that the area to which the construction of wells may be profushly extended is limited in Gujurat. At the same tion, an neiter palicy of encounging well construction, wherever irrigation is possible, will result in a great deal of good, and with this object in view I would advocate the opening of a separate department. Such a department could construct wells departmentally where the cultivators

are too ignorant to take up the work themselves, or advance takes in small instalments and keep n watching eyo to see that the money so advanced is utilized for the purpose of well construction only.

Under the Bombay system, Government will derive no direct advantage in the shape of increase in revenue by helping the people in the construction of wells. In garat soils well will irrigate from two to four neres. In the famine year two crops were grown in surcession in charotar. In the black soil, an average of only two neres could be irrigated from a well.

A well with a diameter of 8 to 10 feet and a depth of from 40 fret to 60 feet will cost from 11s. 500 to Re. 700.

Besides these two means of irrigation, eig., small tanks Resides these two means of irrigation, riz., small tanks and wells, it is dangerous to advocate any other system at irrigation in Gujarat. Irrigation canals will, I am afraid, prove the rain of the province. Gujarat is a flat and level plain, and wherever any serious difficulty has been experionced in the way of soccessful agricollare, it is in the chaps of water-lagging. In almost agency part of Gujarat, alt. offerseence can be observed in patches in low-lying lands. It is, therefore, to be frared that the introduction of casals will increase the sall efforcemence and do more burn than good by creating user lands as in Northern India.

There have been two axed presents a provints most in this part.

good by oreating user lands as in Northern India.

There have been two canal projects monted in this port: (i) the Tapti canal, and (ii) the Sabarmati. In the case of the former it has been decided, I believe, that it will not pay. It will pass through a tract of black cotton soil and will not be therefore utilized lu ordnary yrans; it may, however, create water-lagging to a serious ordent. The Sabarmoti canal has been proposed as a paying investment. It may or may not pay. It is, however, probable that the part of Sanand, through which it passes, may be damsged by salt efflorescence. Salt efflorescence is observable in Sanand, and this question requires to be thoroughly threshed out before the project can be advocated as a boucheisl measure.

Drainage —There are parts in all the districts of Gujanat which are low-lying and water-logged. Prainage channels hove been constructed in some of them. In some cases drainage channels are not feasible for want of proper fall. As a rule, low-lying lands form salt on the surface. In some cases lands have been relinquished owing to the formetics of two reach salt. formstion of too mach salt.

- 1. Q. (The President)-You are Deputy Director of Agriculture, I understand?-Yes, I have lately been mpointed.
  - 3. Q. Is that for the Bombay Presidency !- Yes.
  - 3. Q. Where are your headquarters ?-Poona.
- 4. Q. Were you here during the recent fumine?—Yes.
  5. Q. Wou say in your note, "there is no obstacle to the extension of inleation arising from the causes mentioned." extension of inleation arising from the causes mentioned, except in parts where the black cotton soil provisits." Would you kindly give us your views nboat black cotton soil. It causes a great part of India, and apparently from the evidence takon, does not require intigation. We find there is no question about the oultivators being gind to have the rains of Heaven on block cotton soil, what then makes them relactant to take irrigation; would they take it if they could get it for nothing?—Except for rice no irrigation is practicable in black cotton soil; this soil is mostly confined to Surat and Broach. The Baroca railway statino makes conveniently the division of the two principal varieties of soil—black and gorat.

  6. O. You say that rice cultivation on black cotton soil
- 6. Q. You say that rice cultivation on black cotton soil takes irrigation ?—Yes, largely, and it is almost more remunerative than rice irrigated on goral soil, because black soil is less pervious to water than goral.
- 7. Q. We heard in Kathiawar that black cotton soil would the water for mything if there was a substratum of muram; what is your opinion?—We have no substratum of muram: in the case of muram, water passes down the nuram and along its sorface too, thus drawing the sarface
- B. Q. (Mr. Highur)—If muram is impermeable, does it take nater !—It way not take it.
- O. Q. (The President)—Do you think the agricultarist is right in refusing irrigation except for rice cultivation ? -Yes,
- 10. Q. Take a crop of juari, would it be injured if it got water?—In the case of juari, where water is required only

- ones to save the crop, it is impossible to irrigate it from wells; beause the black cotton soil cracks and the water passes into the oracks without making any progress over tha soil; the cases of a conal it would be easier to irrigate it, because the canal can flood the field, at the same time water is seldom required except in the hot weather. The irrigation of black cotton soil is impracticable and mat prolitable. Cotton doesn't do well nuless the soil cracks, and water would prevent it eracking and make it as the cultivators express it "thanda" that is to say, it would not produce a full crop during the succeeding year. In black soil, cotton ripens and the halls open and os the weather becomes warmer and the sail cracks. In goret soil, cotton grows into a hig tush and does not produce much lint. once to save the crop, it is impossible to irrigate it from wells; into a hig bush and does not produce much lint.
- 11. Q. What happees when a storm of rain comes on black cuton soil P—Tho black cotton soil cracks in the hot weather, and as soon as a slight shower of rain fulls, it swells and the cracks are filled up. When the rainfall is small but well distributed, it produces good crops, and when the rainfall is heavy the ootton plants turn yellow and lose their vigour. Unless a spell of suany weather succeeds, they do not thrive.
- 12. Q. Would not those conditions hold equally well, if a small amount of irrigation were well distributed?—Nn; there is no way of allowing a little water over the suil; it goes into the cracks in the black cotton roll.
- 13. Q. It retains the moistore in itself?—It has great power of absorbing and retoining moisture. If you tarm over a block of soil with nerow-bar, you will find it wet even io May.
- 14. Q. Is there much difference in the black soils of Breach and Strat ?—The difference is that the Breach soil is put or and the country flatter than in Surat, where the country is more or less uneven; thus allows the min water to pass off easily. The soil in Surat is mixed with lime. Broach district; cotton is sown in June, but does not right ill February. In Surat, juari is grown as a monecon erop: fa Broach as a rabi erop.

3 Dec. 01.

11

Mr. P. R. Mehta.

- 3 Dec. 01.
- 15. Q. So where you find this black cotton soil, you would nat recommend ony great oatlay on irrigation works, unless the people are prepared to sow rice and take to rice on livation?—Yes, but there is no village which is not prepared to sow rice if you give the water. If you increase the rice are all property recompletes the property of the millages for the you directly promote the prosperity of the villages in the rice-growing tract; if you provide irrigation works, you can depend on the people constructing kiaris or rice-beds.
  - 16. Q. Is rice more profitable than cotton ?-Tes.
- 17. Q. Woold what you say apply to Brooch ?—In Broach, as I have stated in my answers, it will be difficult to extend rice cultivation, because Broach is not n rice growing district, and the population is sparse. You want 10 to 15 labourers per nore at the time of transplant-ing and harvesting. I have been told that, if the cultivation is extended, the labour-supply will come; but I do not think so, because the labour will be required during the monsoons, so, occane the indoor will be required utring the monodos, and people of other localities have generally work at that period in their own villages. In Broach, it is the custom for labourers from other parts to come over during the harvesting operations, but that is after January when there is no work in their own villages. Again, rice calti-vation requires manure, and to produce manure you want extra eaths, which would mean a grazing area, and that is not available in Breach, because all the land is cultivated.
- 18. Q. Have you any experience of the Nerbudda and Tapti Valleys? Does the same hold good there?—Yee, the irrigation from the Nerbudda and Tapti will go through black soil, but in my opinion, there will be a great chance of the land becoming usar.
- 19. Q Won't they irrigate in that country ? Only rice, there must be some dry crops still for proper rotation.
- 20. Q. (Mr Ibbetson)-I understood you to say that if wa could give them water they would put every acre under rice; what you now say seems to conflict with that statement?-I was referring previously to small tanks only.
- 21. Q. (The President)-You say, " for the encourage moat of loans under the Land Improvement Act, I would recommend interest at 5 per cant." Are these loans largely availed of in Gujarat ?—Of late years they have been.
  - 22. Q. What are they taken for ?-Mostly for wells.
- 23. Q. Do they take them for the repair of bunds ?-That is supposed to be done by Government.
- 24. Q. You have montioned interest at 5 per cent. What is the present interest asked for by Government !-- I think it is 5 per cent.
- 25, Q. Do they find that interest high. Would they avail themselves more of it, if it was lower ?—I should say that smallness of the instalments rather than of the interest would be a greater indacement.
- 26. Q. You think Government recovers too rapidly? -Yes.
- 27. Q. What period would you recommend? At present the policy is to grant from 10 to 15 years: 20 years, which is the law, is not given.
- 28. Q. I understand that the system in Pombay is that, if a man makes a well, it is not placed under wet rates ?-Yes.
- 29. Q. Supposing that, instead of recovering takeri by instalments, Government merely mode a man pay wet rates for a certain number of years?—It would come to the samo thing.
- 30. Q. You say in reply to question 13, "the yield of rice depends upon the position of the rice-beds. Rice-heds situated higher up and receiving only the rain water will yield about Rs. 20 to Rs. 25 worth of produce, those situated lower down receiving the accumulated water of the higher levels will produce a crop worth about Rs. 30 to Rs. 40"; that merely means they get more water?—Yes.
- 31. Q. I suppose rice is the only crop cannls would irrigate P—Practically we have got some highly fertile garden lends in which extensive irrigation is practised from wells, and these are well provided with wells.
- 32. Q. They are exceptional, I suppose P—Yes, they occur in patches; no aid is necessary.
  - 33. Q. Private canals don't exist !-- No.
- 34. Q. Do yau mean that they are not possible on account of the configuration of the country ?—Yes, I mean that in Surat you would do more harm than good by introducing a large quantity of water, and so increasing water-logging and salt efflorescence.

- 35. Q. (Mr. Muir-Mackenzie)—You don't mean that they would be impossible ?— No, but the herm done by canals would be greater than the advantage derived.
- 36. Q. (The President)—Have you seen the effect of drainege upon salt offerescence ?—We have get low-lying lends which produce salt efferescenes and some which do not; I think it depends upon the way they dry up.
- 37. Q. You are probably aware that in certain parts of India salt efflorescence has been checked, and lands washed by effectual drainage?-No.
- 38. Q. You say in reply to question. 30: "No annual charge is incurred on the repairs of tanks; nll that is required is to dig them deeper when they silt up. In the black soil districts, such as Surat and Broach, such repairs are needed overy 20 years. In Kaira, where the light soil (goradu) prevails, the tank silt is utilized for manning adjocent fields, and no such repair is needed." Are these repairs done by the Public Works Department?—Yes.
- 39. Q. How is it no annual charge is incurred?-It is periodical, not annual.
- 40. Q. Have you had much experience of tanks silting up?—I don't think there are any dain existing. Tanks want digging periodically. We cherge a water-rate to the people who are supplied. There ought to be a more systematie plan of deepening the tanks.
- 41. Q. Would it he better to take them out of the hands of the Public Works Department, and give them to the people !-- 1 he people will not take them up.
- 42. Q. Why?—Because they pay for tank himagat or essistance, and therefore expect Gorennant to repair the tanks. People, even if they did not got sufficient water, would not allow the himagat to be cancelled, and thus less their right over the tank. They would want in the hope that the tank would be repaired.
- 43. Q. Even, if Government were to eny, we will reduce your wet assessment by a cornain percentage if you undertake the maintenance?—They would not agree if Government removed the whole water-cers. The cost of repairs would be very great and beyond their means, because the tanks have not been repaired for many years.
- 44. Q. Do I understand that you consider Government should do more than it has done in the repeirs of miner tanks ?-Yes.
- 45. Q. Have you may figures to support that statement?—In Surat the tank assessment comes to Rs. 60,000, and I think the charge incarred is Rs. 10,000 a year, that is repair charges.
- 46. Q. So that Government make n olear gain of Rs. 50,000?—Yes, if you wish to put it that way.
- 47. Q. (Mr. Muir-Mackensie)—You oonsider Rs. 10,000 much too little of course to spend?—Yes.
- 43. Q. That is because the tanks have been left so long without being repaired?—Yes.
- 49. Q. They were left a long time without any repairs at all?—Yes.
- 50. Q. If the repairs had been dono regularly and numbally, do you think the cost to Government would have exceeded Rs. 10,000?—Possibly not.
  - 51. Q. Would it exceed Rs. 20,000 ?-No.
- 52. Q. That is to say, if the tanks are sunnally regained Government can make a very reasonable profit upon its water-rate?-Yes.
- 53. Q. Perhaps Government would have to spend some Rs. 3,00,000 in order to put them into repair f-Yes.
- . 51. Q. That is, because they have been left so long out of repair?—Yes.
- 55. Q. (The President)—As regards the construction of wells, have the recent famines created any stimulus. Are more wells made now than befare?—They made some wells during the famine, but the people cannot be expected to do anything for the next ten years.
- 55. Q. Does not even the feer of a future famine induce them to make them f—They are ufraid to incur fresh liebilities. There is no money left in the country after the late had years topped by a severe famine.
- 57. Q. Some witnesses have recommended that Government should itself make the wells, do you approve of that?— From the cultivator's point of view, it would be a good
- 58. Q. Is it your experience that there is much difficulty about determining the proper site for a well?—None at all ; as a matter of fact, we have very little difficulty, because ye

have no hard rocks. It is possible to dig to water level, 40 feet, at n cost of Rs. 10 to 14. 15. The cost being so little, that elaborate investigations and the use of apparatus are nat necessary.

- 69. Q. How do they sink wells?—They first make a hole, and when they reach good water, they put in a wooden frame and go on building and sinking.
- 60. Q. You say in reply to question 24 "wells exist in cultivated fields, and there is enough area to which irrigation could be extended. The average area actually irrigated from a well could not exceed two ocres." That is a small area ?—Perraps, but that is my experience thaugh statistics bring out three agree; there are many wells that do not irrigate at all.
- 61. Q. lint if the wells ore in the hands of a good cultivator, how much could be trigate from a well?—He would irrigate in yorat soil four lofive neres and perhaps not more than two acres in black soil. That would be a well of one or two mote.
- or two mets.

  62. Q. I understood you to say that, owing to the depth of rock, there was no difficulty in fixing the site of a wall; but you say, in reply, to question No. 38—"I am of opinion that expert advice is granily needed with regard to borings "P—That refers to the period after they have made a well. Boring appearants to deepen wells after they have been already built 30 to 40 feet, and experts to work them are greatly needed. The peopla themselves use such apparatus and have succeeded in improving many wells. A well costing its, 1,000 which, but for the horing, would prove useless for want of sufficient water, would become ethcient by the expenditure of an extra its. 20 to its. 50 spent on horing 20 to 30 feet, but the people do not properly understand boring, and their present efforts are haphazard. It is, therefore, incressury to have an officer who has studied the anbject.
- 63. Q. You say, "on river bonks ulluvial or bhatta soil exists in patches;" these are subject to immediate These lands are not protected ?—No, bhatta is that soil on which alluvium is deposited every year in high floods.
- 64. Q. It is a positive benefit to have the river flood on il ?-Yes.
- 65. Q. I understand you are not an inlocate of large tanks. Do you mean by n large tank one irrigating 5,000 acres ?—Yes.
- 65. Q. Yes. Would you object to storing water on a large scale like that. If you had a suc, do you think it would be a valuable protection for the movince against bad times?—My objection to irrigation on a large scale is that there is fear of creating water-legging and of throwing land ont of authiration by saft efficie cence.
- 67. Q. Are the people rervous about this weler-logging?
  -No, it has always been recognized as likely to occur.
- 6S. Q. I suppose in these dry years they are rather in facour of \$1? Very much so.
- 69. Q. (Mr. Muir-Mackenzie)—Would kiaris or ricebeds succred lu water-logged places?—You would make water-logged areas smiling plains by the extension of rice cultivation, because rice being a semi-aquatic plant succeeds in such areas.
- 70. Q. You canst be very careful lest you spoil the prospects of these lands in years of short rainfall !—Yes.
- 71. Q. (The President)—I suppose you are an advected of drainage on lands that are water-logged?—Yes, drainage from the very nature of the case a said improve such lands; but it has lately come to our notice that in the case of an old drain in the Wagra thinks of the timeh District and the Janton drain of the Jambusar talmia of Broach the people are complaining that the "lith" or curface agricultural sails becoming impoverished. In Janton the people actually requested that the drain might not be repaired and improved, while this was being done as a famine-telief world. The porce of the water is said to wash away the surface soil, appoing inferior subsail.
- aposing interior audiant.

  72. Q. You have seen there famines, and are quite cognirant of the terrible loss to the country that has eccurred;
  suppleading you had reason to believe that there was going to
  less a famine in three years' time, what measures would you
  take to prepare the district to meet it!—The irrigation resources of finjarat have not been systematically investigated.
  I would advicate that aites should be found for tanks
  and wells, and boring apparatus provided. The berings
  should go a simultaneously.
- 73. Q. 16 you think there is store for the extension of tanks?—There are already perhaps 4,000 tanks in Gojarac

for irrigation and dricking porposes, and it is probable there are my more; these are all very old works, but we have done nothing to investigate further sites. By adding to the number of tanks, you would increase the rice cultivation of the lalukas, and the prosperity of the province.

- 74. Q. The measures you would take would be to make the province righer, and so betterable to stand the trial when it came; but small lanks would prahably be empty at such a time?—Yes, no doubt. I advicate wells also.
- 75. Q. Yon would not have an irrigation caunt?—With the exception of wells, probably no irrigation work wantd supply water during an netual tanine year. The Sabarmati canal would perhaps do a lot of good if it did not dry up.
- 76. Q. (Mr. Migham)—With reference to what you say about the digging of tanks, if any now ones were due would the people be willing to pay n water-rate?—Yes.
- 77. Q. Woold it be possible for land-owners to make new lanks themselves: if they made them there would be no water-rate to pay?—They have get no money.
- 78. Q. Suppose liberal advances were given !- Individual holdings are too small to make the owners join in a hig renture like that.
- 59. Q. I suppose water-mies are only paid when they take water ?—They have to be paid every year.
- So. Q. Suppose they do not take water?—They have to pay the rate all the same. If the people could get water till October, they would be willing to pay the rate.
- 81. Q What do you do in practice?—For the existing tanks we charge a councildated rate.
- 82. Q. What about now tanks ?-There are none.
- 83. Q. What is the difference between dry and wet rates per acre?—In Surat the whole rice assessment varies from 0 to 25 per acre, according to the capability of the soil and rice-heds.
- St. Q. Supposing you make new tanks, and bring land under rice cultivation that is at present under dry rate, what would be the increase in the rates ?—That will depend upon the quantity of water that you give and the month up to which you can give it; the enhancement will be from Rs. 2 to 5 per acre.
- 85. Q. If you charge a water-rate anir when water is taken, it would be much more ?--It may be its 7 per acre; the people would pay it willingly.
- 86. Q. The water-rate is not more than double ?-No.
- 87. Q. Then, if a man takes water once in two years, it would not matter which way it went?—No.
- 83. Q. They would take water every year?—Yes; very nearly.
- S9. Q. (Mr. Ibbetson)—However ample the rainfull?—Ter.
- 60. Q. (Mr. Higham)—You say no annual charge is required for repairs, but only periodical?—Yes.
- 91. Q. Da not the bunds require repairing ?-No.
- 92. Q Have not the times get bunds ?—Yes, they amply water by flow. But the bunds don't get broken and silk is put on them when the tank is cleared.
- 93. Q. (Mr. Muir Mackenzie)—Would not the cost of clearing the tanks be unselt greater than it would be, if they had not been neglected for so many years?—Yes, if there was a large amount of silt to be cleared, the cost would be very great; if it was cleared periodically, the cost would be only n few hundreda.
- 91. Q. (Mr. Higham)—Were not the tanks cleared during the last two findings?—The village tanks have not been teached during the last famine. They ought to be cleared, famine or na famine.
- 95. Q. What would be the expenditure on them?—I don't I now. Slace a ret assessment is paid they ought to be cleared.
- PG. Q. Is any record maintained of the money spent periodically on each tank f-It could be got from the Executive Engineer.
- 97. Q. Is there any expenditure incurred by the District Authoraties ?-Yes, on tanks for drinking purposes.
- 98. Q. Small tanks are not cleared at all by the P. W. D.?-No, that is, after the late Resolution.
- 93. Q. Has my reduction been made in the assessment on them by No, the Revision Survey was made, and the rice lands were re-succeed according to the capabilty of the tank.
  - 100. Q. When ?-During the last decade.

Mr. P. R. Mehta. 3 Dec 01.

- · 101. Q. Allowances would be made for the fact that a tank had silted up P—Yes, and for kiaris which did not receive tank water.
- 102. Q. What measures would you propose for clearing the small tanks; weald you put them in the hands of the Public Works Department?—There is no other agency to do it, the villagers would do it, but they have not the money.
- 103. Q. If the villagers got the money, would they do it?-It would require supervision.
- 104. Q. Could not the village headmen do it?—If a small number of meu were employed, they could, but not a large number.
- 105. Q. You would only require the Public Works Department to measure the small tanks, and then it could be given to the men to clear ?—Yes, that could be done.
- 106. Q. You have no Civil Agency to look after the work?—The Civil Officers might manage the small tanks through the villagers, but the l'ablic Works Department or the l'astrict Board Overseer would have to check the work.
- 107. Q. Money would be advanced by Government, and the District Sould would not come into it?—No, as accessment is charged on the tack, Government should pay for the repairs.
- 108. Q. The transactions would be dealt with hy the Civil Authorities and not by the District Board?—Yes, the District Board would have nothing to do with it.
- 109. Q. Have you any idea what expenditure would be required to put the small tanks in Gujarat into order ?- No.
- 110. Q. How many tanks are there which are not under the Public Works Department?—I cannot say, probably under a thousand.
- 111. Q. You say the people have no money; would it be a good thing to spend money on these tanks now for the sake of clearing them, and also to put a little money into the pockets of the villagers?—I think the tanks should be cleared, because they recure the rice crop, and the work would give employment in these hard times.
- 112. Q. In regard to tanke under the Public Works Department, are they kept in a proper state of repair?—There are no tanks in charge of the Public Works Prepartment, When repairs have to be done, the Collector aske the Public Works Department to make an estimate of the cost.
- 113. Q. The initiative is taken by the Civil Officers?— Yes; the Public Works Department have nothing to do with the tanks except to repair them.
- 114. Q. Are they ready to repair all the tanks if asked to ?--1 think they can't got fands; the hudget grant is limited, so the work is not done.
- 115. Q. The repairs of certain tanks may have to stand over ?-Yes,
- 116. Q. In regard to wells, what is the lift up to which people will work?—Onr Survey Department recognizes 40 feet as the ultimate depth to work profitably.
- 117. Q It would be no use to offer any encouragement for the construction of wells to lift more than that?—No.
- 118. Q. Supposing Government contributed the whole cost of making a well when you are more than 40 feet below the surface, would the people not work it after it was made?—
  It would not be profitable; and that sort of place is rare in Gujarat.
- 119. Q. Snpposing yon have wells at from 35 to 40 feet and the spring level fell in n year of drought to such an extent that they could not work it?—In one year of drought, the spring level would not fall much; in case of continued drought the spring level would fall from five to ten feet, but then they would work up to 50 feet if it were just to save a crop. But in a famino year, in addition to the water level heing low, the cattle would be too weak to work and the area irrigated would be small. In Kaira and other places, in the gorat tract, where the water is not deep there was a large area of fedder under irrigation. This year the wells are low and the water seanty.
- 120. Q. I enprose the level of the wells does not fall very much in a first year of famine?—No, it was not much affected in 1899.
- 121. Q. Can you give any idea of how much it was affected?—I don't think it was affected beyond five feet?
- 122. Q. And in the next year, I suppose it was lower?—

- 123. Q. And now?—Now the water is much lewer; it has been getting lewer and lower every year owing to the continuous drought.
- 124. Q. Some people talk about black soil and some about black cotton soil; is there any difference between the two ?—No, practically none.
- 125. Q. You have a certain amount of black soil in Kaira and the Panch Mahals?—Yes.
- 126. Q. The people don't grow octton but wheat on it?

  —The black soil lies low, so they grow wheat and not octton on it. It is too moist for cotton. In Ahmadabad they grow cotton.
- 127. Q. If they had plenty of water, they would grow rice instead, I suppose?—Yes.
- 128. Q. With regard to what you say about its being impossible to irrigate black soil under wells, because the water would run down the orevices in the dry weather; I could not irrigate when there is a failure of the late rainfall. Would not the crevices fill np directly the rain falls?—Yes; hut peeple are afraid of irrigating any erop except rice during a drought in the meason in black soil, as if rains come down on the top of irrigation the crop would be very much injured by excess of moistnre. That is the reason why people walt as long as they can before they apply to the Canal Authorities for irrigation water.
- 129. Q. Would you advocate potting wells down in black cotton soil?—If you want to spend money for the purpose of saving life it would do, but not for agricultural purposes. The well would not be used perhaps for 10 or 15 years.
  - 130. Q. It will never pay?-No, it will not pay.
- 131. Q. You say the distribution of water from the village tanks is controlled by the villagers thomselves. I suppose there is some record about the lands entitled to water?—Yes. There are sometimes disputes but not often except when there is scanty rainfail.
- 132. Q. If there is more water in the tank than they want, de they ever give it to land outside?—Yes, and a water-rate is charged.
  - 133. Q. Who gets.that?-Government.
- 131. Q. It rests with the proprietor to take it P-If no one requires the water, application is made to the village accountant for it.
- 135. Q. He squares the village accountant?—He cannot take it before the other people who have a right to the water have had their share.
- 136. Q Would the man have to put in a written application P-Ycs.
- 137. Q. Do the settlement records show for each village tank what is the area normally irrigated ?—The village accountant has got a statement that shows it.
- 138. Q. What does it show?—Practically the whole of the area which bears the tank himayat is irrigated every year. It shows the area on which the water assessment is put.
- 139. Q. Do you think that the rice area has diminished?
  -No.
- 140. Q. (Mr. Muir-Mackenzie)—Has the yield diminished P-Yer, owing to scanty rainfall.
- 141. Q. Have you any reason to suppose that the water received now is less than was estimated after the Revision Settlement was made?—Sufficient time has not passed to show if there is a difference on account of tanks silting up.
- 142. Q. (Mr. Higham)—You said that land-owners are willing to have tanks and get irrigation. You also said that the people wou't make tanks or undertake the repairs even if lot off the wet assessment. Does this mean that the cost of construction and maintaining tanks is more than the profits derived?—There must be a lot of places in Gajarat in which it would pay, supposing you could find the spots.
- 143. Q. Take it as a whole, if Government lays out money would it pay ?—It would not pay except in certain places.
- 144. Q. I understand the Topti Canal is considered undesirable, because it will irrigate the Broach district and irrigotion is not required there ?—Yes.
- 145. Q. What are the land-owners in Broach saying nbent it. Do they desire it ?—I have not talked to anybody about it. In fact the project is an old one and no discussion on it has taken place in recent years.
- 146. Q. There have been applications from people for a canal from the Sabarmati, but nothing of the kind from

French ?-There ore water-legged villages in Breach and the canal will do harm nod increase the water-logging.

- 147. Q. (Mr. Muir-Machenzie)—You have been lo England to the Royal Agricultural College and taken an agricultural diploma?—Yes.
- 148. Q. You have also had one of the Government Experimental Farms in the Decean under your charge?—
- [Mr. Muir-Mackenzie to President.—He is regarded as an efficient officer and a very good nuthority on such matters as soils, survey, and technical matters now under discus-
- sion.]

  149. Q. I sm anxious lo get an explanation regarding this question of rico assessment. You were asked the difference between the dry crop rate and the wet rate. Now, taking Borad, I find the dry crop rate at the last Revision bettlement trought an average of 4s. 5.4-11 per sere; the rate upon rice lands which existed from the original settlement brought out a rate of Rs. 7.8-9 per acre, the difference of Rs. 2.4-0 is the difference which you want. How much of this Rs. 2.4-0 would Government get, if they made a new tank?—This Rs. 7.8-9 represents the average assessment of rice; but the kiciris, bearing tank himayats, would be assessed higher, say about Bs. 12.
- 150. Q. The tank kiari rate would be Rs. 12 per acre and dry crop is Rs. 5-4-0. How much would be for akasia or rain water and how much for tank himsyat?—It will be about Rs. 31 each.
- 151. Q. In rice lands, Government would oberge both akasia and himayat?—No. Government would charge only dry crop rates plus himayat.
- 162. Q. If a man converts his dry crop land into rice lands by hunds, so as to hold rainfall, Government charges nuthing; but, if a tank is constructed which gives him water, Government will charge for the water Yes. In the revision Surrey Position class was charged instead of abasis in case of new rice, but as the field work is finally closed now, in cases of new rice on dry crop lands, no increased a sessment could be charged except for the use of the tank water. the tank water.
- 15?. Q. And the amount of that charge for the water will consist of the difference between what the rice land would have been assessed at, if it had been old rice land without himayat, and the fall charge with himayat?—It ought
- 151. Q. Taking this district again, we arrive at an average of its. 12 for tank-assisted rice?—Yes.
- 155 Q. And about Rs. 8 for unessisted rice: therefore, Government would charge Rs. 4 an acre for tank assistance. On the other hand, we have had no case in which such a thing has been done; no new tank has been made?—No.
- 156. Q. Now, as records this question of tank repair, the rates at the period settlement, which look place within the last decade, were fixed with reference to the state of repair of the tunks at that time?—Yes.
- 167. Q. Have yoo any reason to believe that the tanks have got into a very much worse state of repair since that date?—No.
- 158. Q. If Government now puts them into a thrrough state of repair, it will be giving the people the benefit of the tanks with better supplies than at the time the assessment was made?—Government is nuder an obligation to repair them: they have not spent money on the construction of the existing tanks: they charge water-rates, and ought to repair them in order to keep up the emply.
- repair ment in order to keep up the empty.

  169. Q. I understand you to say that the supply has not materially diminished since the time of the Revision Settlement?—Kn. If you had tanks you would add greatly to the prosperity of the villages. The Revised Settlement Survey was made during the last ten years, and all the tanks have been necessed. There have been no changes since them, and an material improvements. My reference is to the obligations of Government from the teginning—before the original cettlement.
- 160. Q. (Mr. Ibbelson imposing that at the last Revision Scattement, a tank was badly sized up and a low rate was put on the land in consequence; and if Government now clears out the tank and improves the supply of water, is there any way by which it can enhance the assessment during the currency of the cettlement?—No.
- 161. Q. (Mr. Muir-Mockenzie)—Is there nu power that Government reserves under the Land Revenue Acti-I believe Government nave no right to enhance the assess-

meet on kiaris bearing himsyat however much they Impeove the tank during the corrency of the existing settlement. They could not do so at the termination of the existing settlement. ment, because individual inquiry and subancement will not take place. In feture assessments, there will be only a general rise or fall of assessment, according to prices, &c.

162. Q. You talk of the obligations of Government. For the sake of meanment, I do not kay it is my opinion, I wish Io contend that Government is under no obligation, legal or meral, to repair these tanks. On what grounds do you consider that Government is under obligation to great them 2.—We charge higher rates for table. repair them ?-We charge higher rates for tanks, because people are supposed to onjoy a continued advantage; but they cannot continue to enjoy that advantage, unless the tanks are repaired. We charge a higher assessment; but we do not spend any maney on the tanks. As we charge a higher rate to the people for tanks. I think we are morally bound to see that a full sopply of water is made available.

163. Q. If a higher rate is charged on tanks, Government is bound to make the full supply nealiable for which the rate is charged, but we agreed just now that at the last Revision Settlement, the mount of supply that was available was estimated, and the rate charged was based upon that estimate?—If you take that stand-point, then you get out of the obligation.

164. Q. I want to come to a logical conclusion. Where has Government failed in doing what you consider part of its daty?—I say that Government has charged assessment for thirty years, and yet has never repaired the tanks.

- 165. Q. Are you golto sore that the tanks were not just as much silted up at the beginning of thirty years as they are now ?—No; but it is reasonable to believe se.
- they are now ?—No; but it is reasonable to believe so.

  168. Q. (Mr. Ibbetson)—Take the case where a tank was partly silted up, and suppose that the supply was vory insufficient and insecure, thet, in consequence, at the revision of sottlement, a low rate was put on the land; and suppose, then, that Government spends a considerable sum in clearing the tank; would you then revise the assessment and charge a higher rate, or would you still prevent Government from charging the higher rates?—I think we would have to be content with a low rate, unless the whole village is charged, and you put the village into a new group during the next revision; but a water-rate or lecreased assessment could be charged if the people agreed to pay it in consideration of the advantage they would derive from the repairs or extension of tanks.

  167. Q. You would put on the weter-rete ulthanch account.
- 167. Q. You would put on the weter-rete, although you are already charging wet assessment?—We could put on the water-rate per acre and then deduct the amount for wet assessment from the consolidated rate.
- 168. Q. You say that, if you make tanks, people will grow rice; then the construction of tanks is one of the best possible means of beloing the people if they can have practically unlimited rice cultivation?—Yes.
- 160. Q. A good many people seem to think that rice cultivation is inscoure !- I do not agree with that view; rice cultivation is less insecure than any other caltivation if protected by tanks.
- 170. Q. (The President)—About the Tspti and Nor. budda projects you say, "they will never pay, because people must keep a certain area of dry crops ?"-Yes.
  - 171. Q. Is that only because it is black soil ?-Yes.
- 172. Q. Why need they keep the area for dry crops Why should not they bright almost the whole of the area in the crops must come in rotation as the land is black.
- 173. Q. Why not irrigate folder?—My great objection to a cannl in these two talukas is particularly that it will waste certain valuable areas which now grow excellent dry crops. Fodder crops do not pay except near hig cities.
- 174. Q That is a very important point. Whereas up-country we irrigate with plenty of water nearly 75 per cent. of the area; here you seem not to eare for water except for rice erop !-Yes.
- 175. Q. Supposing there was plenty of water available apart from the black soil, why should not every field be rilgated?—The people do not want it.
- 176. Q. Why do they not want it f—In Gajarat they could grow valuable crops of juari and bajri without irrigation. In the mouseon the people would hold off and wait for rain in the fear that if rain foll after irrigation the crop would be more damaged then before.
- 177. Q. What about the wheat cropf-Wheat may be increased by irrigation.

Mr. P. R. Mehta. 3 Dec. 01.

- 178. Q. Wheat is sawn on rice lands, I suppose?—No, very little; most of the wheat is grown on low-lying land on which moonsame crops cannot be grown. They do not irrigate wheat, except here and there in patches.
- 179. Q. Why not irrigate a large area of wheat. They do it op-country under country because other crops equally valuable are more easily grown without irrigation. Almost all wheat even grown in Gojarat is unirrigated.
  - 180. Q. It is grawn in wet soil !- Yes.
- 181. Q. (Mr. Ibbetson)—I thought that you said you had some irrigated wheat in the district?—Yes, in particular meas.
- 182. Q. (The Prevident)—That is only in black soil?—Yes, only on low lands.
- 183. Q. Would not higher lands like those of Kalm grow wheat !- They would.
  - 164. Q. Would it pay?-Yes, if irrigated under a canal.
- 195. Q. (Mr. Bbetson)—The question I want to clear up is this; if Government make tanks and canals would the water be used !—Yes.
- 186. Q. Do you think a canal wanld pay f-I suppose a canal would pay in the light soll of Mairn, at least the water would be utilized fully.
- 187. Q. You propose that taken i loans be refurned in more than ten or fitten instalments; how many do you propose?—Thirty to fifty, leaving it ut the option of the people to pay it scorer if they like.
- ISS. Q. How long does n well last ?-I think they go on everlatingly if repaired.
- 189. Q. Do they ever turn brackish?—Some of them do on the ren coast especually.
- 190. Q. In that ease you would remit the balance of the lean?—I would : it would encourage the people.
- 191. Q. Supposing a well costs lis. 509, and you have lis, 50 paid up in instalments after ten years, and then the well fails, and Government has to remit Rs. 450. Government would lose most of its money: the term seems too long!—If you want to promote well irrigation, I think the loss will have to be suffered.
  - 192. Q. Do you think it is worth while f-Tes.
- 193. Q. A great number of small tanks are silved up; they are so small that they are hardly worth the attention of the Public Works Department; and the Government does not propose to clear them, because they are so small?—Yes.
- 194. Q. Would it be advisable for the District Beards to take them in land, supposing there is no legal objection?—You may give them legal power to take oil anced assessment for cleaning the tanks. Why should not the towerment do it?
- 195. Q. Fecause they are too small to repay the cost of professional labour?—I think that would be better done by the village authornies; the Collectors and Assistant Collectors could manage that.
- 196. Q. You prefer that Government should do it directly through the Collectors and Assistant Collectors, rather than by the agency of the District Bonds P-Yes.
- 197. Q. Why should not the District Boards do it?—Practically a District Poard is a Collector.
- 198. Q. You say that it would be a good thing if Government were to make wells themselves, and then leave them to the cultivators?—Yes.
- 199. Q. You don't propose that wells in the land of an occupant should be made without the consent of the occupant?—No.
- 200. Q. Do you think the occupant would willingly allow Government to make a well in his land?—I think he woold be very much pleased to allow it.
- 201. Q. I'o you think a cultivator would not object to a lot of small Government officials coming on to his land and coming there coatinuously for some time ?—No.
- 202. Q. Do you think Government can dig a well as cheaply as oultivators can ?-Perhaps not.
- 203. Q. If Government dug a well and charged a waterrate, would it be objected to ?—They would pay for the water in a year in which they used it, but they would never consent to a permanent increased assessment.
- 201. Q. Well, if they object to the water-rate, then Government must recover their money by instalments ?-

- You may do so, but they would rather have that then a permanent increase in assessment.
- 205. Q. Suppose the villagers could build a well for Rs. 500, and suppose the Public Works Department builds it for Rs. 1,000. Government has to recover the Rs. 1,000 from the villagers, who will thus have to pay twice as much as if they had built the well thouselves for Rs. 500?—Yes.
- 206. Q. Whuld the cultivator pay at the rate fixed on for Rs. 1,000, when he can make a well himself for Rs. 500 P—Yes, in a year in which he could utilize the well.
- 207. Q. In how nonry years would be utilize the well—two in three or one in three?—In some places he could utilize it for three out of five years; in other tructs hardly ever.
- 208. Q. The cultivator would not, you think, approve of the scheme of Bovernmeet making the well?—Not, if you want him to pay for it.
- 200. Q. In fact, your view is that, if Government were to make wells regardless of expense and without recovering the cost, that it would be good for the cultivator F-Yes.
- 210. Q. In black cotton soil, it would not pay the cultivator to make a well F-No.
- 211. Q. Even, if a number of wells were made in black cotton soil, you believe they would practically be unused?—Yes.
- 212. Q. You are very much afraid of water-logging from caoals in black soil !- Yes.
  - 213. Q. And even from large tanks ?-Yes,
- 211. Q. Hare you ever known of water-logging in low-lying tracts?-Yes.
- 215. Q. Have you ever seen land water-logged by canal irrigation?—No, not in these parts. We have no canals except two small ones.
- 216. Q. You say that the people do not take advances for tanks, because they think that the Government is baund to clear them. Would they take advances to make new tanks?—No, the area commanded by each cultivator be very small; I do not think that a hundred or two hundred cultivators could be induced to join together to make a tank.
  - 217. Q. No co-operation is possible !- No.
- 218. Q. You say that Government should make small tanks where there are suitable sites; do you think; there would be many suitable sites; is any large extension of irrigation possible in this way?—Yes, Government our make tanks which will irrigate from five to fifty acres.
- 219. Q. Would they pry Government a reasonable return !-Yes.
- 220. Q. Do you think a very considerable extension is possible !- Yes.
  - 221. Q. Has any survey been made? -No.
  - 222. Q. No one knows where there sites are ?- No.
- 223. Q. Could not a survey be started P-Yes, for the purpose of a thorough Investigation of sites; they should also take up the question of burng.
- 224. Q. Have you ever known of unmanured soil being irrigated ?-No.
- 245. Q. Can you tell us what the result to the soil would be?—Without manure irrigation would not pay.
- 226. Q. We are told constantly that the great obstacle to successful irrigation is the want of a manura supply ?-I do not see why the supply should be limited
- 227. Q. If you had an unlimited supply of manure, it might pay?—I think manure will come when it is wanted. The ones under irrigation would increase grainally and sources of manure supply will increase in proportion.
- 223. Q. You cannot say what is the effect on the soil of irrigation without manure P-It would produce low class cereals and the soil would be impoverished.
- 229. Q. Do you speak from experience f-Yes, I have never heard anywhere that irrigation had injured the soil.
- 230. Q.—Have you ever heard of irrigation without manura !—In the Konkan rise is a cree, or very solden, manured; but the rain water must bring down silt from higher levels. Even in the Konkan fields receiving manure grow better crops than those that are neglected.
- 231. Q. You do not speak from experience?—No, I have never heard that irrigated crops are grown anywhore without the assistance of manure.

3 Dec. 01.

- 252. Q. You think that there is great room for the extension of wells?—You may do a lot of good by extending wells in places like Charciar. It is a very fertile tract and has an industrious class of enlitrators. If Government apend money there, it will be a profitable investment. A lot of good could be denot there.
- 233. Q. (Mr. Rajaratna Mdlr.)—You say that, at the Revision Settlement, the areas fallen out of irrigation owing to silting of tanks were small?—They were insignificant.
- 231. Q. You also say that in fixing n low assessment at the Revision Government took into consideration the condi-tion in which the tanks were when they were token over by Government. How much lower was the assessment?—I do not think it was very much lower. The increase of assessment depends on the capacity of the tank and other factors auch as prices, &s., and not on the classification of land. Our classification is one thing and our assessment another.
- 235. Q. Can you give me an approximate idea of the loss 230. Q. Can you give me an inproximate tack of the loss of resenve to Government in coosequence of the had state of the tonks?—No. I doubt if it could be worked out. We never think of assessing water separately and land separately. Our estimated proportion of water-rate and soil-rate is not n true ratio.
- 236. Q. The poorer the seil, the better the adventage to the cultivator by means of irrigation from tanke?-Not in this part of the country.
- 237. Q. I simply want to know what revenue is eacrificed on account of the unsatisfactory condition of your tanks?—If the tanks had been kept to preper repair, the assessment would have been raised. For instance, in the Surat district, where the tank assessment is Rs 69,000, if the tanks bed been kept in proper repair, f fhink the assessment should perhaps have gone up at the revision settlement to Rs. 70,000; this, however, is simply o guess.
- 238. Q. Yon ear, "no remission is given on lands left uncultivated owing to iosufficiency of water supply." Is that the practice !—It has been the practice in these parts.
- 239.  $\bar{Q}$ . Are there rules for granting remission, when the supply fails i—No; it is not the custom.
- 240 Q. Thornies don't prohibit it?—There is no rule prohibiting it. I do not know of any rule which says remission should be given.
- 241. Q. Was no remission granted in the recent famine, even when the tanks gave out?—It was granted for the whole crop, and not for water-rate only.
- 242. Q. You say irrigated cotton does not pay as well as other agreed tural crops, have you undo any experiments?

  Not exactly; I think we did something of the surt; we experimented with cotton in the Khandesh district. Io the experimenced with cotton in the Abandesh district. Io the corat soil cotton grows in huge bash-e without producing much lint because this soil does not crack and dry up quickly as the black cotton soil.
- 213. Q. In four written answers you refer to the average area under irrigation. Is that area cropped a second or third time, or is only one crop taken?—One crop. What I mean is an average area irrigated in ordinary years.
- 214. Q. Is a record crop not taken from the same field ?-It may be, if the held is very strongly manured.
- 215. Q. Yesterday, we had a une evidence regarding paddy lands. How do you closs them in your settlement; at what rates do you assess them?—Rice lands are assessed according to the capacity of the heds to hold rain water, whether arrigable from a tunk or not, and the fertility of the soil.
- 216. Q. On what grounds is such a charge made if lands are turned into rice lands at the raym's cost? If new lands are turned into paddy lande, seek lands are charged as new rice on which the assessment is lower than that on the oldrice.
- 247. Q. Supposing the raynt gives up the cultivation of paddy, do you re-tran-fer it to faragut at the expiration of the suffement?—Yes.

- 213. Q. (Mr. Muir-Mackenzie)—You said there were Mr. P. R les for constructing new tanks; but I understand that Media. sites for constructing new tanks; but I understand that small tanks are found all over the Sarat district?—All over
- 249. Q. You don't mean merely bandhs?-No, tanks; though bandhs one very useful also.
- 250. Q (Mr. Ibbeston)—A bandh is a long bund across n klope or shallow draioage?—Ves. They exist in the Ahuadabad district, it has a peculiu form of cultivation ander them. In the mensoon the impounded water is let off in rice beloe on the other side of the bandh and in rabin excellent crops of wheat are grown in the ones where water was impounded during the mansoon.
- 231. Q. (Mr. Muir-Maclenzie)—There are in Virangaum and Ahmadnbad large number of bandhe doing metal
- 252. Q. You speak about the deopening of existing tunks or the making of new bands on the rites you have described; do you think that would be a good form of work in famino?—Yes.
- 253. Q. Here you any anggestions to make as to improveing the existing taken rales?-No. I have no direct cargetlen.
- 251. Q. Indirect; you have heard what the people say P-The distribution should be made by some responsible officer, and the leakage stopped.
- 255. Q. (Mr. Ibbetson)—At present who actuelly makes the distribution?—More or less the lists are prepared by Talatis, Mamletders, and Arni kerkmas. Such investigations as ore necessary ought to be made in every village by higher officers, who should see to everything the aren of land, the selection of people, &c. Money should be paid in installments as the work progresses.
- 250 Q. (Mr. Muir-Mackenzie)—How many kachcha wells are there?—In gorat tracts many kachcha wells were dug during the famine year.
- 257. Q. Are they valuable f-Thay are highly valuable for growing fodder.
- 258. Q. How early in the year ought one to knew whether famine ought to be expected ?—I think by the cud of October.
- 259. Q. Must you wait so long?—In Gujarat we do not get much min after Ostober. I think we must wait till we get the Deceals showers.
- 250. Q. Must you wait so long; would you not begin to baild kackeha walls at once ?—Yes; if the rains hold off you might begin carlier. A kacheha well would cost from Rs. 15 to Rs. 20, and would save valuable crops.
- 281. Q. Suppose there is a failure of the rainfull of a district by the end of September; would it be advisable to give advances at coce for kachcha welle?—Yes.
- 262. Q. You think the more wells made during a prosperous year, the better it would fortify the country ogainst famine I-Yes, that is so.
- 268 Q. Do you not think that the enlivators would be more inclined to take odvances from Government, if they had not to reply the principal but were made to pay an enhanced assessment?—I think they would consider that the worst form of repayment.
- 254. Q. Why?—Because somotimes they borrow only a portion of the money from Government; and if they grow a good crop, they repay the debt as soon as possible. An enhanced assessment would be a permanent clurks and a burden on their children. A man would rather do the thing himself or leave it ulone.
- 265 Q. He would not like the idea of un enhanced gressment !-- No.
- 266. Q. I sappose you are aware that n number of wells are made in the Notive Stotes on that principle !—Yes, but I do not consider comparisons of Native States with our teritories very sotisfactory. In Native States the rules regarding loans, &c. are not hard-and-feet; they are very clustic.

WITNESS No. 13 .- Mr. C. V. Veunon, I.C.S., Assistant Collector, Ahmadabad.

Answers to printed questions.

3. Brozeh.-I have only known the district since January 1890, and therefore cannot say whelher small tanks would hold water in seasons of average rainfall. Very many were dry to 1999.

I have seen high earthen dams made of such soil at Mr. C. F. Maturia, Dorn, Trykeri, etc., but nated that there is a greet tendency for large fissares to form after the iret heavy rain.

Mr. C. V. Vernon.

3 Dec. 01.

I should sny that in the black cetten soil of Breach there is absolutely no demand for water for irrigation at any time except in seasons of drought. It is only in such seasons as 1899-1900 that the owners of black cetten soil think of irrigation and then chiefly us a means to tide ever the year, e.g., by raising fodder crops for their cattle. I believe tanks for irrigating such soil nro considered both parameters and animaering. unremunerative and unimportant.

- 6. Village and district irrigation works are, so far as I know, constructed by the Public Works Department in the Ahmadabad District. I doubt whether the responsibility of Government in connection with their maintenance after they have once been constructed and the rates fixed is at nll clearly defined. It is the case that rayats continue to pay for water advantages which no longer exist or in years in which no irrigation water is received. I have not heard of remissions being granted for any other reason than that the holder was absolutely unable to pay. District Boards repair irrigation tanks when these are also used for domestic and cattle-natering purposes; not, I believe, otherwise. District funds could not bear the burden unless extra revenue were assigned to them.
- I have known instances of irrigation tanks and bands instances where the landholder has sufficient capital, but in case of small heldings organization is difficult. There is a given for such purposes, but allotrents exceeding Rs. 1,000 are in practice extremely rare. The up-keep of all tanks and band irrigation works certainly requires greater attention. The daager in encouraging the construction of new works consists in the fact that it encourages the conversion of dry crop into rice land which experience has hitherto shown to be a very speculative so as to secure a tolerably certain supply of water, then this objection would disappear. The chief source of water-supply for cattle is at present tanks and these are very liable to run dry before the lot weather, the time when they are most needed. Drinking troughs atteched to wells then take their place; a systom which could secure a tank supply in the hot weather would be a boon. In Sanand very many irrigation tanks are also used for watering cattle. instances whore the landholder has sufficient capital, but in
- 7. In such talukas as Sanand wells are a profitable

2. In such taining as Sauand wells are a prolitable speculation in many parts, and even in the present year existing ones are largely in use.

In Vagra taluka, Bronch, where the sub-soil strata are largely salt. I believe a very large proportion of the wells constructed during the famine were failures.

8 Broach District.—The Bara tanets to the west of large transparent Program Broach Stratage.

Jambusar, Vagra and Broach talukas.

Jambisar, Yagra and Broach tellakas.

Water-logging has been a complaint for many years and many drainage channels were constructed both before and during the famine. More could be constructed with profit, but the up-keep of existing ones is still more important. They probably do not result in any immediate increase of revence, but might provent considerable loss in bnd seasons.

bnd seasons.

9. In Broach, north of Nathada, relief works consisted shiffly of large village tanks for watering proposes. The cost was wholly inconnuousurate with their utility. There were also drainage channels. One or two embanked road works were started, when the rains made tank work impossible. South of Narbada several irrigation tanks were ropaired and metal quarried for two important lines of road. Of the tanks constructed in 1899 some hold of road. Of the tanks constructed in 1899, some hold water (e.g., in Broach, Tenkari Sarbhan, Shigaon, A'med, Dabha) and some do not (e.g., in Broach, Dorn, Mataria i.e., in 1900-1901), and in Abmadahad, Shiawara (though a very large tank). Apparently the bottom takes some tims to settle, so that it is too early to speak with confidence. It seems certain that the process of siltation is often very rapid and that practically nothing is done to stop this, e g., in way of water-gates or siltation tanks.

#### II.

#### A. -General.

1. I have served in Ahmadabad, Surat, Dhárwar and Broach. The answers will relate mainly to Ahmadabad and Broach. In the former district I have held charge of

- Daskroi, Parantij and Medasa for a year (1897 May to 1898 May) and of Virumgam and Sanand for a few days. In the latter district 1 held charge of Vagra, Ankleshwar and Hanset from July to October 1900 (i.e., in the rains) and af Jamhusar, A'mod and Breach from February till August 1901
- 3. (4) In Bronch the black cotton soil (north of Nurbadda) is balloved to be unsuited for irrigation. It is also believed that irrigated cotton does not thrive. The experiment is rarely made. Rainfall rarely fails. In 1899-1900 mont is faroly made. Rainfall rarely latis. In 1899-1900 a considerable number of wells were constructed to raise (1) fodder crops, (2) such garden crops as onions. The soil, being full of cracks and holes, takes very much weter and except for years of utter drought the cost is probably incommensurate with the profit. In all ordinary years cotton occupies the soil for the greater part of the fair season. In Kall (Daskroi) I have this year seen a cotton crop irrigated from a well. from a well.
- (6) The initial expenditure is necessarily heavy for owners of small myatwari holdings and cannot be mot where that people are much in debt.
- (9) Lack of enterprise in making kacheha wells, eg., Koli cultivators. Lack of proper organization in constructing tanks and bunds by private enterprise.
- 4. So far as I know improvements are exempted from taxation during the period of the next Revision Survey (Section 107, Bombay Land Rovenac Code). As to whother distinction between "holdors'" and "tonsnts'" improvement is made I know nothing. I am of opinion that there sheald be no such distinction.

The provision of the law must be known to the people, but their view is likely to be affected by lie fact that (in Ahmadubad) revisions have usually meaut enhancements for other reasons.

- 5. Baforo the famine of 1899 the Ahmadabad cultivators (e.g., Parantij) were unwilling to take advance, because they thought the collection system would allow of no excepthey though the three that the famine (with the liberal advances of takayi and the remission of interest) has motorially altered their view, so that there are few who are not glad to get takayi. The difficulty new is (with the staff available) to distinguish the deserving cases quickly enough.
  - 5. (1) (2) (3) No, not in ordinary seasons
- (4) Is hardly passible, because the setual expenditure would be lard to entimate. Again it night set a premium on bad bandobast.
- (5) The period allowed by law is sufficient except where one famine or scarcity follows another.
- (6) In famino times part may be remitted (o.g., in rice tracts where there have been two or more successive faitures).
- 6. The people (in Sanand) have been very keen in the past on obtaining facilities for conversion of dry crep into rice land. The recent repeated failure of rice may check this.

#### D .- Tanks (Ahmadabad).

- 23. (1) Largely by rainfall, also by such irrigation channels no the Khari Cut supplying Chaudola Tauk (talaka Daskroi).
- (2) By channels where the level of the water is high enough; otherwise by jheels (e.g., taluka Sauand—Irriga-tion channel and bund in Mamkol village constructed by the owner of the village who is an Alunadabad Bania). Is Viramgum I have seen a case in which a double jheel was used, raising the water first to an artificial basin and theace to the required level.
- (3) (a) (b) (c) In years of drought and scanty minfall such sources are likely to fail. In years of mederate or ample rainfall they tide over the breaks and serve to keep the crop wet after the rainy season is over.
- 21. (1) I believe two crops are rarely, if over, grown one after the other in the same season on the same land.
- (2) Irrigated rice when it succeeds is believed to pay much better than dry crops.
- 26. When the tank gives out wells are sometimes ased, o.o., a lot of Kamed rice is now heing irrigated from kachela wells in the village of Upardal, taluka Sanand. I do not know whether there is much of this, but certainly it is wholly exceptional this year in Sanand, perhaps because the tank sapply was not sufficient in most cases even for sowing the crop.

- 29. The private owner has to construct lackcha channels to the source of supply and must also serround his land with a bood to keep the water in. In the hilly parts of Dhurwar the tank is often at a high lovel, and terraces of rice land one helow the other are constructed by the owners.
- 30. Tanks and bunds constructed by the Poblic Warks Department are osnally repaired by that Department often with the help of a contribution from the rayats. Disturble suppleys a special Engineer for the purpose. I do not know whether there is a proper system in Ahmadabad for keeping repairs up to date. On this point the Executive Engineer can give evidence.
- 32. In the case of poor Thinhdars and Inhuddre grantaio-aid or rigal advances might be given. In a village of
  the Karajei taluka of Dharnar I once negotiated a lean
  of Its. 2,000 to a big cultienter for construction of a rice
  tank. I renember rightly he had praviously received
  Rs. 2,000 for a similar purpose and was paying up promptly.
- 33. I can give no definite information but believe the sole tank does silt up in course of time. When the tank whole tank does silt up in course of time. When the tank is once filled, there should be some exstem for shutting off any further inrush of witer which would only bring in silt.

### E .- Wells (Ahmadabad and Brosch.)

- 31. (2) Experimental well- often turn out salt especially in such trusts as Viraughm (District Ahmadabad) and Vugra and Jambusar (District Breach) which are near the sea or a salt Rano.
- (3) Kackeha wells Rs. 5 and upwards; palla wells Rs. 250 and upwards.
  (5) By a leather water-backet hanging from a pulley and raised by a puir of bullocks.
- 1. Q. (The President.)—You are Assistant Collector, Ahmadabad ?—Yes, from 1896 to 1898 I have been Assistant Collector here.
- 2. Q. You have been As Dharwar and Broach?—Yes. Assistant Collector nt Sarat,
- S. Q. Where were you in famine ?- In Broach.
- 4. Q. Was the famme severe in that district ?- Yes,
- 5. Q. What do you think will be the best thing to do for this district in order to protect it sgainet famine?—Much need not be done for the reason that in n district like Broed scarcity and failure of rain is very uncommon; famino has occurred once in a century. The crops are very valuable in ordioery years, especially in Broach where cotton is grown. It would not be worth while endeavouring to cusure projection by irrigation schemes.
- 6. Q. Would they grow fodder by irrigation ?-The fodder question is a difficult one, they would grow fodder by irrigation if the sub-all water is good.
- 7. Q. Doyou see my way out of the difficulty !-- No, except fodder can be brought by railways from elsewhere.
- 8. Q. From where would you propose to bring it?-From the Central Provinces.
- 9. Q. Could you not grow it here; is there not sufficient land available?—There is very little waste land. In the famine of 1899 fodder did not grow, it dried on. We had only obout 5 inches of raio and fodder could not be grown.
- 10. Q. The best pointy for Government to pursue for a district like Breach where famine course only once in 50 or 160 years would be to relieve the distress when it comes!—
- 11. Q. Do you ndvocate drainage in your district?— Drainage channols are used in this district; n good many have been made since 1894; they were made both before and during the famine; but there are still water-logged areas in reveral talokes; they were mater-logged even for a considerable part of the season in 1900
- 12. Q. Are you aware of any objections being mised to the educating channels? I quite understand the objection in dry years?—I have not heard of any objections.
- 13. Q. Is there n feeling among the people that these drains should be made f-wound of them were made on the representations of the people. Last year white travelling through the Broach taluku I had two or three applications for eartain drains.
  - 14 Q. (Mr. Ibbetton.)-Did you say last year?-Xes-
- 15. Q. (The President.)—That was during the time of sear ity?—No, it was not in the year of searcity; it was after that.
  - 16. Q. Are they en a large traic?-No.

- 35 (1) I have not heard of two harvests being raised on the same land, but where rice has failed wheat has been ruised by means of a well (e.g., Kethal, tainks Sanand).
- (2) Wheat and rice are usually more valoable than dry
- crops.

  18) In years of scanty rainfall and drought wells are sometimes the coltivator's only stand-by.
- 38. (1) Great difficulties are eocoontered because the character of the sub-soil unter is so expricious. The people, however, soon learn where sweet water can be brid, and a kachcha well is not costly.
- (2) In the Broach District and in Sanand and Virsua gam of Ahmudabad I believe rock is rarely, if ever, encoau-tered. Sandy soil sometimes presents difficulties, as the well is likely to fall in. This difficulty is obviated by the construction of a circular wooden famon ork which is inserted below the level of the masonry.

Where kacheka wells can be made so cheaply I think boring tools are of little or no use, especially as the ordinary boring implements are very heavy and east a good deal to more and also are, I believe, hable to break it not skilledly mnnipalated.

40. Temporary Lucheha wells ure a good desl esed in parts of Sanaad and parts of Aledása. They cost very little and advances to construct them are of great use, though it is difficult to select the proper cases.

Acts.—The Government Resolution under reference was received by me late last night and was only read through lo-day. I have, therefore extremence from difficulty in pulling such expetience as I have beenly together. Most of my Ahmadabad experience was he as lirst year of district like. In Riconch there was famine and to Dharmat a very severe plague epidemic which engressed at alternion.

- 17. Q. Are they ten feet wide?-About that I thick,
- 18. Q. Do you know whether they were carried out as famino relief works?—Yes, some were.
- 19. Q. Are the people generally well off?-They are all in debt; though the crops are rich, the people are poor.
- 20. Q. You say here in reference to the Ahundahad people hefore the famine that "they were unwilling to take advances." Is that your experience in regard to take advances. I have only come back here recently.
- 21. Q. What was the case in Breach?—They elimoured for takavi, but not so much for wells.
- 22. Q. For cattle and seed?—Yes, the difficulty is that the applications all come in one month and are very difficolt to deside.
- 23. Q. Is there on increased domand for takevi for the construction of wells?—Yes, there is; a good many wells were constructed in Broach during the famine.
- 24. Q. Would people ruther take tukavi udvances or go to the souccar I 1 do not thank there is any unwillingness to take takuvi; but my experience is rather limited.
- 25 Q. (Mr. Muir-Mackenzic)—Before the famine very little takovs was asked for or given?—I know that before the fumine I tried to induce the people to take takovs, but they would not; they raid that Government would take it back when the instalment time came but that the success would wait; and therefore they would sooner have it from
- 26. Q. (The President.)—You mention to your second paper, paragraph 3, that "In Kah (Dastor) I have this year seen a cotton crop irrigated from a well." That must be a very peculiar elementance?—Since then in the western portion I have seen very many crops of cotton irrigated from wells. I asked the people and they said that it was not done in the pure black soil, but only in the yellow soil and when the rainfull was seanty. They said it had kept off rate.
- 27. Q. Have you seen irrigation from tanks of unything besides rice?-I do not think I have.
- 25. Q. In paragraph 26 you say "when the tank gives out, wells are sometimes used."—Yes.
- 29. Q You say kareal rice is grown by well irrigation?—Yes. In one particular village they grow 40 acres of kareal rice; it was irrigated from a tank—it was a fairly good tank—up to perhaps the end of September; when f got there I saw the well- irrigating it.
  - 30. Q. Do you know how deep the water was 3-No.
- 31. Q. It must have cost a great deal of labour?—This village is largely in the hands of a particular sourcer.
- 32. Q. Have you any present experience in regard to wells in rock buying failed?—There are no noths in the

Mr. C T l'erven. 3 Dec. 01.

Mr. C. V. Broach district as far as I know. I have not heard of any difficulty of that kind.

- 3 Dec. 01.
- 33. Q. (Mr. Higham.)—In regard to smull irrigation tanks you observe that the District Funds would not bear the burden unless extra revenue was assigned to them P.
  - 34. Q. Do you think that the District Board should be called upon to undertake the works and have extra revenue assigned to them or that Government should undertake to do it?-Better that Government should do it, and net the District Board.
  - 35. Q. Have the District Boards not the advantage of local knowledge?—I do not see that they have the advantage of local knowledge; Government have as much knowledge as the District Boards. In any case an Engineer, I suppeso, would have to carry out the work either for Government or for the Local District Boards.
  - 36. Q. It will have to he done by an Engineer?-I suppose so.
  - 37. Q. Havo the District Beards or Lecal Boards their -As far as I know the Local Boards have own Engineers ?only overseers; the Executivo Engineer looks after big schemes.
  - 38. Q. I nm speaking of small ones. Could the Collector undertake the work ?—He could do it, I suppose, Could the through Civil Agency, but he might need professional assistance.
  - 39. Q. If it is decided by the Engineer how much work is to be doue, could the Collector get it done by Civil Agency through the village headman?—I think he could do so but I cannot say; it would he well to have supervision by the Public Works Department to see that the thing is done,
  - 40. Q. Would it he difficult for the Revenue Officers to look after the work?—I think it would.
  - 41. Q. (Mr. Ibbetson.)—Are they going to open relief works in Broach this year?—I should think not; I think the district is fairly well off.
  - 42. Q. Suppose famine was to occur in Broach suddenly ero you prepared; have you had any surveys made?—I think the Executive Engineer has prepared schemes, which can be supplemented by works for the construction of small channels. I have had representations made to me by people here and there for these.
  - 43. Q. I suppose the Excoutive Engineer is generally in possession of information?—I really do not know.
  - 44. Q. Do you think it advisable to try the cultivation of rice on any large scele?—From my experience of this district I can say that the rice crops have failed hers for the last four years.
  - 45. Q. In fact the whole of your experience in India has been in bad years?—Yes; to some extent.
  - 46. Q. Was 1897 a bad year !- It was not a bad year, except for rice.
  - 47. Q. Did the rice full?—The rice crop was very poor; the other crops were fairly good.
  - 48. Q. At any rate the average has been fair to normal? -Yes, but I think it would be rather a risky speculation to turn more land into rice land in a conatry where the rainfall is always under 30 inohes.
  - 49. Q. Yon say "wells are n profitable speculation," are wells a profitable speculation in any large proportion in the Broach District?—No, I should not think so.
  - 50. In a small proportion?-Perhaps to the south of Broach, where it is more like Surat.
  - 51. Q. What proportion is that of the whole?-Abeut one-fourth, I should think; it may be more.
  - 52. Q. Is there room for the extension of wells ?-I do net know ; it is a difficult country.
  - 53. Q. You eay as regards the exemption of private improvements from enhanced assessments: "So far as I know improvements are exempted from taxetion daring the period of the next revision survey," Is that based upon actual knowledge of your own. Have you found that peopls have doubted that there will be exemption?—Perhaps it is rather hard to say.
    - 54. Q. You have no definite information ?-No.
  - 55. Q. You say as regards takavi "the difficulty new is (with the staff available) to distinguish the deserving cases quickly enough"?—I should like to qualify that. In the case of takavi the question is whether a man is solvent or

- 56. Q. Why?—He is to be paid au advance.
- 57. Q. Ho pledges bis land?—We must know how far it is mortgaged; or whether the land is his land.
- 58. Q. Is not the loan on the laud for irrigation the first charge ou the land?—Yes, it is; I believe there is some law that when taken is given the persons interested should be informed; I am not quite sure about that. My idea is that we should not defruid the earlier creditors.
- 59. Q. You do not defraud the earlier oreditors by taking the land as security !-- Well, one dees fool that
- 60. Q. Is that the strongest objection?—I do not know, I do not think it causes much delay; if a man has not got a mortgages in possession he would probably get his loan without much trouble.
- 61. Q. You say it would be herdly possible to remit an udvance made for digging a well in case the well fails, because the actual expenditure would be hard to estimate. Suppose a man digs a well and finds salt water, would you advocate remission of the advance?—The people know to a great extent the areas in which they can find water and those in which they cannot. Sometimes they make n well and find brackish water, which damages the land in the long way. I think Comment with the termit in that care loug run; I think Government might remit in that case.
- 62. Q. You don't think it should be always done? No.
- 63. Q. You say "where kachcha wells can be made so cheaply I think hering tools are of little or no use," do you mean boring with a drill f-Yos, a sort of a drill; it is n very heavy instrument.
- 64. Q. (Mr. Rajaraina Mdlr.)—In paragraph 8 of your first note you say "many drainage obasnols" were constructed both before and after the famine;" would the drainage channels cause loss of water in a bad season; would they drain away the water too feet?—Yes.
- 65. Q. (Mr. Ibbetson.)—A bad season would be a season of heavy reinfall ?-Yes, in some cases.
- 66 Q. (Mr. Rajuratna Mdlr.)—It may have the effect of heuefiting the crops in some cases ?—Yes.
- 67. Q. In your second nete, in paragraph 4, yen sey "the provision of the law must be known to the people, but thoir view is likely to be affected by the fact that (in Ahmadabed) revisions have usually meent enhancements for other reasons." What are the "other reasons" Is the enhancement very high, oemparatively !—It varies in different parts. In the Sanaud taluka it is about 30 per cent; not less.
- 68. Q. If there were no enhancement, do you think that wenld give a stimulus to the extension of well irriga-tion?—I do not think they are unwilling to build wells.
- 69. Q. In your second note you say "the period allowed hy law is sufficient, except where one famine or scarcity follows another?"—That is largely with reference to the graut of loans for wolls.
- 70. Q. What is the period allowed for the repayment of loans for agricultural purposes?—Two years for bullocks and seeds; that is the usual rule; it may be relaxed by Government.
- 71. Q. In paragraph 6 of the same note you say "the people (in Sanand) have been very keen in the pest on obtaining facilities for conversion of dry crops into rice land. The recent repeated failure of rice may check this." What is the "recent repeated failures"—A succession of failures of rice.
- 72. Q. (Mr. Muir-Mackenzie.)-Do you think that there is any kind of relief work, better than the repairing of roads or the constructing of new tanks, to be undertaken in times of famine?—I think there is no better form of relief work than irrigntion tanks.
- 73. Q. Large or small ?-Small would he the most nseful.
- 74. Q. I am talking of new tanks ?-Theu, I do not know.
- 75. Q. Do you think the multiplication of wells north of the Norhudda would add to the security of Broach against famine?—I do not think so.
- 76. Q. For the irrigation of cotton P-I do not think so ; they would not irrigate cotton at all.
- 77. Q. Not even in a famine year ?-It might be worth trying.
- 78. Q. You would advocate kachcha wells below tanks?

3 Dec 01.

- 79. Q. The multiplication of tanks would facilitate the construction of kuchcha wells?—It would; they would get water more easily than other wells.
- 80. Q. Have you seen a good many water-logged areas? —I have seen certain areas in Breach and Ankleshwar, in the Breach District, and some areas in Virangaum.
- 81. Q. Do you think any permanent improvement of these mens may be effected, so far as the normal seasons are concerved, by constructing drains?—I believe so.
  - S2. Q. You are inclined to approve of them f-Yes.

83. Q. Do you think that prior to the famine the Mr. C. V. objection of people to take taken was due to the rigidity Versan of the collection f—Yes.

81 Q. Do you think it would be any improvement if instead of giving taken in the ordinary way for wells. Government gure the rayet the whole money and charged him bagayat assessment?—It would have to be very earefully explained to the rayet.

85. Q. Would you advocate the sinking of trial shafts for wells by famine labour?—I am afraid not. The people know very well where they can get sweet water and where they can't.

WITNESS No. 14 .- A. E. L. EMANUEL, I.C.S., Assistant Collector, Ahmadabad.

Answers to printed questions.

I.

Point 4.—Besides the Sabarmati, other possible sources of irrigation are 1—

- (1) The tributaries of the Sabarmati in Modása and Pardutij talnkas, riz., from cast to west in order, the Watrak, Majham, Meshvo, Khari (mainly canadized), Hathmati (canadized already).
- (2) The Bokh rift and lakes in Parantij—already the subject of a large project.
- (3) Variona smaller streams, as the Dhamni and others in south Modáss, the Luni in Parántij, the Redh in Sasand and Dholka, streams at Upardal, Juhár and Derti in Sasand, at Ehekda, Kamlej and Khareda and elsewhere in Gogho, ot Walthera in Dholka, at Mandal in Viramgam.
- (4) Nallahs running into the Sabarmati and other rivers.

With the exception of the Meshya, middle and lower Khari, and greater Bokh lake, these sources all ran almost or quite dry in the famine, and therefore at another place I have stated that little water, except in the Sabarmati, ran to waste in the famice. However, in better years water could no doubt be retained.

I should perhaps hare added (5) a good deal of surface water running into the Nal salt lake in Yiramganm, Sasand and Dholka, which might be caught into tunks or otherwise held up.

In Modera (especially the corth), and in Gogha, roak and hard ground will offer some obstacles to irrigation, and in most of Modes the population is too wild to take much advantage of irrigation.

Point 7.—In the famine of 1859-1900 grants were made in each district for improving village water-supply. In my charge (Parántij and Alodéra) there were osed to deepen a good many village drinking wells, which has run quito or almost dry—with sneece—ful results.

Takavi was need to deepen irrigation wells. In Modé-a, however, many irrigation wells which ran dry were dug and blasted without reaching water. In spite of this, almost the only crops in Modésa were a few patches runnd the surriving wells, sometimes only one patch in a village. A few villages, thungh, had not a rood of crop.

Point S.—Much of Modáca Mahal east of Dhannars is a collection of small holes in which the water evidently loss in wet weather. The draioing of this would, I believe, fit a large tract for cultivation, but there is not at persent the lesst cult for land in that neighboorhood and the population is sparse and rude.

Many villages of Sansand and Dholkn, I remember, wed to complain of water-logging or of the entry to the village or some particular bottom being flooded annually. I think Siarsda in Dholka, and Knlava in Sansand are io tamoes. Near Bagodra in Dholka are rushy swamps which draining would make cultivable. One is marked 'Hatel lake' on the may another the 'Kala Nat'. The land is nlienated land.

The routh and east sides of Virangaum town are swampy, and draining them might improve the health of the place, not as Dholka and Ahmadabad have doubtless been improved by drainage ents.

Local and Municipal Funds could be used for the smaller of their works.

Possibly the braks of the Nal Itself might be drained for dry crops and the outline of the lake proper thus defined, in-tend of its shading off into ready wartes. Point 9.—I have often been told by villagers of Mr. A. I. I. little bits of work left undone or mischief caused in faming excavations. The Virangaum drains especially seem to have interfered with the Ireders of many village tanks. No doubt further nttention could dispose of these derangements. Sometimes the high drain banks seem to have held off sortiace water from neighbouring fields.

Some of the tanks due in the families are I believe and

Somn of the tasks dug in the famine are, I believe, most valuable improvements to irrigation, e.g., Butal ln Moden, bot many so far from being useful even as drinking and washing reservoirs, or air-refrigerators, seem ta have missed their supply, perhaps had too narrow an entry or one wrongly pleed, and dried up at an inexousably early date I might instance Vulnkad in Gouho and Gota in Deskroi. I believe many of the rillage works were in the hands of incompetent or iodifferent Sob-Overseers. bluices are, I believe, still wanted in many tanks.

II.

#### General.

- 1. My answers refor to the Ahmadshad District, with 7 out of the 8 tulukas of which I have become acquainted, as follows:—
  - 1898-89-Charge through the travelling season and into the famino of Sauand and Dholka talakas.
  - 1899-1900-Charge, throughout the famine, of Püran-
  - 1900-I'wo mouths' travelling in charge of Firam-
  - 1900-A few weeks' travelling over Gogla on Plagae duty.
  - 1897-1901.—Travelling about the bome, taluka Daskroi, occasionally fur various purposes
  - Ido not know the Dhandhuka taluka.
  - 3. (1) Nn.
  - (2) No.
  - (3) Possibly, for although manure is at a discount at most of the Municipalities, cattle-duog is the chief foel and is not easily carted over the lands of large villages.
- (4) This objection may hold in the black soil country of the Biai (in Dholka and Dhandhuka). In many paris irrigation will ecoko salt.
  - (b) No, except in so for as famines threaten.
  - (6) No doubt in many parts.
- (7) I do not think so now that there is a sob-soil asses-
- (9) The small holdings of the rayatwari system make against any such application of capital on a large scale amount irrigation implores.
- (9) Want of large holdlogs, espital and enterprise generally. I think possibly more than one Sabarmati canal might be dug in the Dholla taluka, utherwise oor much water is wasted in a famine year. Salt makes much water useless for irrigation.
- 4. I think the orsestment of sob-soil water, if proposly effected, a audicient inducement to irrigation as far as taxation is concerned.
- 5. Falsly freely, but not nearly so freely as they might to. I think cultivators light sky of indebting themselves to

12

Mr. A. E. L. Government as they know they will have to pay one day,
Emanuel. whereas a 'sarkar' will not forcelose if he can help it.
However, Government could not think of adopting the savkar's method of high interest and should, I think, easo the burden by

- (2) remitting interest altogether, and giving the cultivator to understand that the principal is strictly returnable if not seener, then later. Government has no object in expecting a fiscal profit on the money laid out in takavi, and chould in this way try to beat the savkin.
- I think (4) would be a temptation to dishenest cultivators, who, if they do not know where water is, should be encouraged to find it in other ways than by land imprevemeat loans.

Grants-in-nid will not go far enough.

6. I found people in Sanand and Dholka constantly asking to have their irrigation tanks mouded and also to have large sloping areas of surface water held up by long bandhs .

The people of the Scharmati villages were very keen to have Mr. Pandit's river-side pump imitated when Government were pushing such a scheme.

7-22.

#### Tanks.

23. (1) I think nearly all the tanks of the district are very old. They have evidently been formed by—

- 1. Domming streams,
- 2. Letting an earthen wall across a patural depression or sloping area,
  - 3. Deepening swamps, or
- 4. Damming nallah by,

and fill themselves accordingly.

- A few, like Wasna Dhedhal, have had channels dug to fill thom.
- (2) The water is generally raised by a "dhekadi," or bag hung from a staging and distributed by "pats" among the fields to be watered. The principal "pat" may be banked up very high and with the help of stones, and sometimes has a sharp fall.
- (3) A tank should be full at, say, the end of Soptember, after which it lasts according to its shade, bottom and capacity for from five to 12 months, and this period is sbortened in proportion to the severity of a drought.
  - (4) Say 100 neres on the average.
  - 24-28.
- 29. Bosides making channels for the water the fields have to be smoothed and banked to hold the water. I believe the landlord usually prays for this, when there is one.
- 30 Most of the irrigation tanks proper are in the hands of the Public Works Department for repairs and up-keep, a few are 'village tanks,' and as snoh chargeable to the Local Board and Municipality. These three bodies excavate-silted up tanks as they can, with the help of village coatributions, which are asked for as a condition of repair wherever possible.

The result of the system possibly is that the villagers lose their sense of iesponsibility for the np-keep of the tank (though they might argue that they have to pay taxes and cesses), and will rather let a tank become nearly useless than give it my grutaitous labour. If the village would not take the place to do not its own tanks each description. would spate the labour to do up its own tanks each dry season, very few big job would be needed.

In Sanand and Dholka and elsewhere I heard constant complaints of Public Works tanks becoming useless for want of repair. The local funds recently have been prac-

I remember Mr. Gibb, Collector here, asking Goronment, I think successfully, to give up buying water-rate for lands irrigated from Public Works tanks nominally useful but really become quite insufficient.

Possibly something could be done in the direction of helping the villagers to work annually instead of letting a few tanks get into such a state that big excavation or mende are acceded at long intervals. "Recurring expenses" for tanks are unknown in Local Board budgets.

31. I only remember the one instance of a Knnbi, named Ambaram Punja, who got a concession from Governmout to train a snipe marsh at Sanand. Part of the water was to go to form a tauk. There was much local opposition, people saying they would be robbed of their water, or olse water-logged. They were quieted, and Ambaram was forced to make reasonable provision for

32. If a land-holder is sufficiently big, i.e., has enough land for it to be worth his while to make a tank, I think he should be given every encouragement; but n well should be better than a small tank, as it would generally tap the same supply and will conserve the water better, being underground. I think it would not be too great a concession to the hulder of a convicable tank to result him the to the builder of a serviceable tank to remit him the assess. ment of its area in return for a very moderate occupancy

33. I do not think they silt up very fast. Villagers are constantly asking for their tanke to be dug out becouse they get paid for the labour.

Silt is valued as a manure by the villagers and often taken for that parpose. Tanks are periodically dug on as mentioned in the answer to question 30.

#### Wells.

- 34 (1) Sanand and Dholka 50 feet, Parantij-30 feet.
- (2) Everywhere percelation is the usual source and springs are rare.
  - In Modden many of the wells falled in drought.
- In Virangaum and Dholka wells may go salt at any time with little warning, and very many of the wells are brackish. Round the 'Nul' lake the comparative freshness of the water-supply is cutirely dependent on the annual rains
  - (3) Bs. COO for a masonry well,
- (5) By staging, bullock pulley and leather bags. Oceasionally (ospecially in Viramgaum) a see-saw band-lift, with a lamp of mud as a weight at one end of the lever to counterbalance the water-bneket.
  - (6) Ten acres.
- 35. (1) Many a rain crop (e.g., 'makal') can be repeated in the winter by means of irrigation.
- (2) A cultivator will, if he can make a "kyardi" of his "jirayet" land, or some of it. He will do this for the sake of such a (in this district) speculative crop as rice.
- (3). (b) (c) A woll in a drought will supply the deficiencies of the rain barvest. This was universally the case this famine.
- 98. (1) In Sanand, Dholka and Viramgaum there is often creat difficulty, and many experiments have to be made in finding a place where a fresh water well can be found. Salt water can generally be found.

In Modása and some parts of Parantij the presouce of rock makes water-finding very precariously.

I think the Commissioner's present measures to encourage borings are the first in this district, and are still in progress. I think the lean of boring tools, blasting powder, etc., for experiments can do nothing but good.

The assignment of famine labour for shaft digging, which, I believe, was tried in the Decean, seems also unobjectionable, if properly supervised, but leans of takavi for patently experimental diggings are, I think, too unsafe in this district.

- 39. No. I think Government might as well plongb a entitivatore land for him and hand him over the proceeds. Porhaps the following plan might be feasible: for any good reason land might be tomporarily attached, a well dug is it, and the land returned to the same or another enlivator after expenses had been reconped from the irrigated crop.
- 40. The dry beds of tanks were let out on epecial terms during the fumine, and the rich had gave a good crop from temporary wells. In some villages these patches were the only oultivation.
- In Parantij where the sub-soil water of many villeges is only a few feet sown, temperary vells were dug in all directions and were of the numest value. They had a great tendency to fall in, the soil being eandy, bet could be boarded or bushed np.

In the same way many temporary wells appeared in river beds or river 'bhatha' laud.

A cheap rate for unassessed land irrigated in these ways and ready 'takuvi' for the work of construction are, I think, the best ways of encouraging temporary wells.

- 1. Q. (The President.)—You have been Assistant Collector of Ahmadabad since 1898 f—Yes.
- 2. Q. In paragraph 3, section 6, you say "No doubt in many parts." What do you nean exactly f-1 believe if you allow water to the whole neighbourhood, it will evoke salt in many parts.
- 3. Q. Is that your experience?—I cannot remember exactly where I got the idea from first.
- 4. Q. Do you think the construction of wells would be furthered if increased facilities were given for advances?

  —I think so, to a certain extent, but not much.
- 5. Q. Have you had any experience of giving advance of taken i P-Yes, especially at the close of the famine.
- 6. Q. What was the exact modus operandi?—The rillage officers sent up names of applicants which were tested; we had the whole rillage up en bloc, and gave out the money for seed.
- 7. Q. Were there special arrangements to give money very quickly !—Vez.
- 8. Q As regards wells, what would be the exact process?

  —A cultivator sends a petition; we send it to the Mandatder for inquiry through the lower officers, and according as they approve or not we give the money or withold it. The Assistant Collector uses the site if possible beforehond.
- p. Q. Would you encourage them to ask for takavi
- 10. Q. Do you suggest it to them or advi-e them to take it f-I often got the villagers together and suggested itto them. I told the Manulatdar to induce them to take takavi.
- 11. Q. How long does it take between a man'a sending an application and getting the grant?—That depends upon the officers. I should think a fortnight at least. You have to see before giving money whether the land is already encumbered.
- 12. Q. (Mr. Ibbetson.)—After what period does he get the money?—It would depend upon the energy of the subordinate officials.
- 19. Q. Would six months be abnormal? -Yes, that would be abnormal.
- 14. Q. Three months?—Three weeks or a mouth would be the usual time; inquiries as to encumbrances have to be made. It has been suggested that a man might be sent with rupees to give them on the spot.
- 16. Q. Is that ever done?—I do not think it is actually done; the Assistant Collector gives an order to pay at the local Transary.
- 16. Q. (Mr. Muir-Mackenzic)—That is still done? 1 think the latest system is that the Mamlaidar carries the cish with him?—That was at the end of the famioe when money was wanted quickly.
- 17. Q. (Mr. Ibbetson.)—That was for seeds and bullecles:—Yes.
- 18. Q. Are you sare that the takevi is paid through the taluka Troscury F-It is always done.
- 10. Q. (The President.)—You say "I found people in Sarand and Dholks constantly asking to have their irrigation tanks mended and also to have large sleping areas of surface water held up by long 'handhs." I do not suppose these "handhs" require great labour?—No; I do not think 50; they require to be put carefully in the proper place.
- 20. Q. I suppose a great number of Irrigating tanks were mended in the famine?—Not a great number.
- 21 Q. Yon say "the people of the Sabarmati villages were very been to have Mr. Pandit's river side pump imitated when Government were pushing such a scheme?" Mr. Pandit, t suppose, Indigot engines and pump?—Yes; from them be imigated about 200 acres; and in consequence of his success Government thought of preparing similar pumps.
  - 22. Q. He took the water from the river ?-Yes.
- 23 Q. Did he make any private arrangements with the cultivaters for pumping?—Yes.
- 24. Q You say the tanks are capable of irrigating only 160 screef-A great majority of them were small.
- 25. Q. Did they help stall during the famine : They must have; some of them helped the eattle, as finally the eattle had to be given water from boles in the tanks.
- 26. Q. Mr. Paulit pumpel up from wells in the river led f-Yes.

- 27. Q. You say "if the village would share the labour Mr. A. E. I to do up its own tanks each dry season, very few big joks Erranuel would be needed?"—Yes; but I do not know whether it would be right to expect the people to do this, since they pay water rates.
- 23. Q. In Sanand and Dholka you heard people complaining of the Public Works Department tanks becoming useless for want of repairs. The local funds recently have heen prasticulty "nil." Did you send up any case to Gevernment?—I wrote to the Executive Engineer, telling him that the people of such and such u village were complaining about the tanks being in disrepair, and generally I Immd that the reason for non-repairs was that the village contribution was awaited.
- 29. Q. If the people were anxious to get the tank repaired, were they not anxious to pay a part of the expenses?—I don't know.
- 30. Q. You say "if a landholder is sufficiently blg, i.e., has enough land for it to be worth his while to make a tank, I think he should be given every encouragement." Had you any cases of that kind?—I have mentioned the case of a man who reclaimed a large area and started irrigation. Ills name is Ambaram Punja.
- 31. Q. What is the Not Lake in Viranganm?-It is a salt lake.
- 32 Q. (Mr. Ibbetsen )—Do the people collect salt from it? -No.
- 83. Q. (The President.) -ls It a large lake f-Yes; it is a natural depression, ten miles long.
- 31. Q. You say elx neres is the average area commended by a well?—Yes, I think so.
- 35. Q. The six acres could be irrigated at the same time? -I think so.
- 36. Q. (Mr. Muir-Mackenzie.) How many kos f An average well usually has two Los.
- 37. Q. Not more than three acres to each kesf-No, I think not.
- 35. Q. (The President)—In your second paragraph you say "In the famine of 1899-1900 grants were made in each district for improving village water-supply. In my charge (Parantij and Modasa) these were used to deepen a good many village drinking wells, which had run quite or almost dry, with successful results." How are the wells deepened?—Men were sent down to clear out the accumulations.
- 39. Q. (Mr Ibbetson.)—They did not sink them deeper —I do not think so.
- 40~Q. They only cleared them  $\mbox{\it P}{--}\mbox{\it Yes}$  ; and  $\mbox{\it j}$  erhaps they dug them deeper.
- 41. Q. (The President.)—What do you think is the best form of protection for a district such as Ahmadubad against the encroachment of another famino?—I agree with Mr. Mehto's idea that irrigational surveys should be made and tanks constructed on favourable sites, but wells hold water longer.
- 42. Q You don't knew the Khari scheme f-I don't know it, but I know the country through which the Khari Canal goes.
- 43 Q. (Mr. Higham.)—You say in your note, "these three hodies excavate silted up tanks as they can, with the help of village contributions which are neked far as a condition of repair wherever possible.' Are the villagers supposed to contribute to the eleannee of their tanks: —Preference is given to the villagers who do make such contributions.
- 41. Q. Is there any rule about it ?-I think there is a Local Board rule and a povernment Resolution.
- 45. Q. Lecal Boards only clear nut tanks which are used for drinking !-- Yes.
- 48. Q. They do not clear out injection tauls !- Possibly they do clear some of the small tauks used for irrigation.
- tion.

  47. Q. If any revenue is carned on a tank, it would not be cleared by the Local Boards !—As a rule, such tanks would be carled Public Works Department tanks.
- 48. Q And these Public Warks Department tanks the Poblic Works Department don't take in hand unless the villagers are ready to confribute?—I think they generally wait for that.
- 49. Q. They give preference to those who contribute?
- -Yes.

  50. Q. Did the Public Works Deportment dig out tanks to any large extent before the familie of 1899 8-No.

51. Q. It was deferred for want of money and want of Bodget sauction?—The reason was that the people did not or would not contribute their share. Mr. A E L. Emanuel.

3 Dec. 01.

- 52. Q. What chere ?-I do not know exactly.
- 53. Q. You say the villagers ask to be allowed to repair the tanks, but they want to be paid for their lahour? Yes ; eince the famine.
- 54. Q. They want to get money?—Yes, and they like to get labour in their own villages.
- 55. Q. I do not quite understand what you mean by assessment of sub-soil water ?—In the Revenue Settlement in certain talukee icetesd of charging anythicg extra on account of wells the land is charged according to the amount of water supposed to exist under the sub-seil whether there is n well or not.
- 56. Q. How do you measure the quantity of water under the sub-soil?—Trial borings nro made, and it is generally known where water can he obtained.
- 57. Q. (Mr. Ibotson.)—You sey takevi cannot be given without making inquiries as to the escurity. Why should that be necessary when you have the land?—You cannot be sure that the land is not already encumbered.
- 58. Q. Is not the Government loan a first charge on the land ?—Yes.
- 59. Q. Then the enonmbrance does not matter?-No. I supposo not.
- 60. Q. Is not delay a great factor in preventing people from applying for takavi?—I think dolay tells a good deal.
- 61. Q. I notice that some of the witnesses say that inquiries have to be made as to the man'e edvency?-
- 62. Q. Is that tree ?-Yes; sometimes his land is worthless.
- 63. Q. There must be many parts of the country where you know that the land is a sufficient security without any inquiries?—If you do not happen to be on the spot, you must make inquiries as to the mau's solvency.
- 64. Q. Speaking of making people repair their tauks you onite agree with Mr. Mehts that it would be hopeless to get them to dig tanks? You say "villagers are constantly asking for their tanks to be dug out because they get paid for their labour?"—Yes.
- 65. Q. Mr. Mehta said they would expect Government to dear them for them and so let the tanks go absolutely into disrepair ?—I helieve there is much truth in that.
- 66. Q. Do yoo know why the villagers are made liable for 10 per cent. of contribution when they are alreedy assessed for the water they get from the tanks ?—I do not
- 67. Q. If they do not pay the 10 per cent., they do not get their work done?—I do not know.
- 68. Q You do not suppose, at any rate, that the work is done for them if the 10 per cent. has not been paid?—I think the Public Worke Department try to get the 10 per cent.
- 69. Q. Yoo say you do not think that fear of future enhancement would prevent men extending irrigation now that there is a sub-soil assessment. I do not quite understand you?—I think I made a mistake there.
- 70. Q. You say again that "assessment of sub-soil water, if properly effected, is a sufficient inducement to irrigation as far as taxation is concerned." How is there inducement to irrigate ?-If n man uses cub-soil water below hie well, he

gets the advantage without having to pay anything more.
71. Q. He has got to pay the assessment whather he makes a well or not ?—Yes.

- 72. Q. I suppose you do not know anything about the way in which these things are actually worked ?—No.
  - 73. Q. You have no practical experience !- No.
- 74. Q. Are there any rules under which a Collector can ahetain from recovering all the instalments of takavi in a bad year. Supposing a well goes wrong or crops fail?

  —As far as I know the rules, the Collector has power to suspend recovery of instalments in times of famine.
- 75. Q. Do you know of any rule which empowers the Collector to do so except in times of famine ?—I do not remember anv.
- 76. Q. Have you powers to moderate the rigidity of recovery ?—I have had petitions to abstain from recover-

- ing instalments and I think they have been accepted. I remember some inetances in which this was done.
- 77. Q. You say you would remit the interest on advances for welle?—I think so, if Government has no objec-
- 78. Q. Government has to berrow the monsy and it will have to bear the less if it remits?—It does not berrow.
- 79. Q. It berrows enormons snms every day. Do you think it would be worth Government's while, as a protective measure, to give takavi in Ahmadabal and Breach free of interest?—I do not think so. [I think so now, for wells. (May 1902.)]
- 80. Q. Would the result he worth the less of money? No. I do not think it would. [I now think it would. (May 1902.)]
- 81. Q. You say that remission of advances in case of wells will be a temptation to dishonest cultivators. Why is that?—It would be a sort of gamble at the Government expanse.
  - 82. Q. They would become more epsenlative?-Yes.
- 83. Q. Suppose Government only remitted its advacce in casse where wells have gone wrong; do you think any provision of think sort would remove your objection to the remission of takavi?—I think then there would be no objection.
- 84. Q. You say "I found people in Sanand and Dhelka constantly asking to have their irrigation tanks mended and also to have large sloping areas of surface water hald up by long bunds," these bunds could be easily made by themselves !—Yee; they would have to combine combine.
- 85. Q. Would it be quite impossible or hopolese as far as you know to get people to combine for work of that sort?—I don't think they will work without boing paid.
- 86. Q. Do they make small tanks?—They do make them within their own fields.
- 87. Q. Anything that would irrigate 200 acres ?-I de not remember any so large as thet.
- 88. Q. Do you think they could be induced to build tanks by grants-in-aid?—No.
- 89. Q. Would it not be possible for I coal Boards to dig tanks and keep them in repair?—I don't think they can ever de more than one or two a year.
  - 90. Q. Thet is for wast of funde?-Yes.
- 91. Q. You say "the cultivator is responsible for these tanks, make him an allotment and get him to do the work;" euppose the Local Boards were made an allotment, do you think the work would be done?—I think so.
- 92. Q. Do the Local Boards keep up drinking tanke?
- 93. Q. There is no reason why the Local Boards should not manage a very great number of small tanks?-No.
- 94. Q. De you see any objection to that ?-I think they do it at present.
- 95. Q. If a man makes a tank and speads money on it Government pute an extra assessment on the land; suppose the Local Boards were to make these tanke, would it be reasonable for Government to give them a portion of the enhanced assessment ?-Yes.
- 96. Q. Government could do the big works and allow the Local Boards to attend to the small works?—Yes, I think so.
- 97. Q. Your experience of Local Boards is that something of the kind may be done? - Yee; in good years the tanks would make a good return, in had years they would lose nothing. The distinctions between the Local Board tanks and the Public Works Department tanks are arhi-
- 98. Q. You say "a well in a drought will supply the deficiencies of the rain barvest," and you say also that welle fail in their supply—I do not see how you reconcile the two things; do wells generally fail in drought?—Not the
- 99. Q. Generally the wells were of great assistance during the famine  $\ell\!=\!\!\mathrm{Yes}.$
- 100. Q. (Mr. Rajaratna Mair.)—Could yoo tell ns what are first and what second class works ?—I am afraid I do not know.

3 Dec. 01.

- 101. Q. Do yan think it fair to call upon the cultivators to contribute 10 per cent, of the cost of repairs, more especially considering that the assessment is not remitted even in seasons of drought?—It does not reem fair.
- 102. Q. In case a tank is constructed by a prirate individual you remit the entire water rate and charge bim only inrayet rate?—I think so.
- 103. Q. Land irrigated under the tank is not liable under the present rules to pay any water advantage rate?

  I think there is a special contract made in that case.
- 101. Q. I think what you mean by sub-soil assessment is assessment on land according to the depth of water?—Na, according to the water facilities.
- 105. Q. Suppose and well is due by the rayat and water is found at 20 feet depth and another at 40 feet depth, what would be the sub-soil rate?—The sub-soil rate would be fixed before the well was dag.
- 108. Q. And after the well is dug?-The rate remains the same
- 305. Q. Then what is the meaning of calling it a sub-soil rate?—Formerly the rate used to be charged on wells; but now the well is not considered at all and simply the projects in the land is considered whether it is suitable for a well
  - 108. Q. What is a riversido pump?-A steam pump-
- 109. Q. Has it been successful !- I think it is a great
- 110. Q. What is the cost per acre irrigated ?- I do not
- 111. Q. Do you know what is the cost of boring tools?—I am ufraid I do not know.
- 112. Q. Are myats willing to take loans for these boring tools?—It has only just been tried, and I do not know the result.
- 113. Q Do you think thoy pay for the services of men omployed P—I do not thick they have men at present.

  114. Q. In paragraph 39 you say "for any good reason had might be temporarily attached." Under what condition would you attach the lond P—For arrears af revende.
- 116. Q. You say "the insufficient supply of manure is without doubt the main obstacle to irrigation." Do the rayats use green leaves from the farests around for purposes of manure?—I have never beard of it.
- 116. Q. Who measures the land brigated under the canals and other irrigation works in the Ahmadabad district, is it done by the Public Works Department or the Irrigatingation Department ?—I don't know.
- 117. Q. (Mr. Muir-Mackenzie.)—Do you think that were advances made to a villager or to a number of people an their joint responsibility for the construction of tanks they would be able to make small tanks, irrigating sof 20 to 30 acres?—I think they might.
- 118. Q. You have nover had such applications?-No. not for new tanks.

- 119. Q. Have you deared old tanks ?-Very constantly. Mr. A. L. L.
- 120. Q. Are you aware that the sub-soil water is deter- I'm inucl. mined with reference in the sub-and water level f—I think it is also determined with reference to the quality of water.
  - 191. Q. The water level is and of the points !- Yes.
- 122. Q. Soppose a village is surveyed regarding the water lovel and aweetness of the water and the saline characteristics of the soil, would you have the data necessary to determine whether it is odvisable to sink a well?—Yes, I think so.
- 193. Q. What kind of works do you propose to start for famino labour-wells or tanks f-I think it depends upon the locality.
- 121. Q. Are there any localities in your charge which require tanks ?-- Very for.
- 125. Q. Do you mean that very few places have been faund where new tanks could be made for rice sultivation?—
  1 would not like to say that.
- 126~Q. You never get applications from people for these tanks ?—Never.
- 127. Q. And for lone bunds—have you ever had applications for these?—Yes, I have in regard to those.
- 128. Q. They make a very good form of rellef work?— Yes; better than roads, but I do not think that in many parts of the district they could make bunds; they could be made only in one corner.
- 180. Q. Are you in favour of granting large advances when famine threatens, for digging kacheha wells?—You, the people have been taught a serore lesson by the lost famine.
- 131. Q. Do you think these wells were a success !—They were very useful.
- 132. Q. Probably for fadder?—And also far grain crops; the sub-soil water is very high.
- 133. Q. (Mr. Ibbetson.) Of what district are you speaking ? The Parantij taluka of this district.
- 134. Q. Is that your charge !- I was there doring the famine.
- 135. Q. Then you have specific knowledge?—Yes happen to know the place well.
- 136. Q. There, these wells are used?—Yes, because the water is so high.
- 137. Q. (Mr. Muir-Mackenzie)—If it is ascertained heforehand whether the water level is very high, it would be advisable in famine times to at once place large smus at the world of the woods and since days. oe navisacie in inmino times to at once place large sams at the disposal of the people and give advances for digging kachcha wells?—I do not think there would be many other areas suitable for kachcha wells.

# SIXTEENTH DAY.

# Ahmadabad, 4th December 1901.

WITKESS No. 15, ME. F. G. PRATT, I.C.S., Collector of Ahmadabad.

Answers to printed questions.

#### GUILRAT.

#### 1. Ahmadabad District .-

Acres-Gross area . 2.192.190 • 1,723,860 Culturable area . . . . The proportion of the culturable area protested by Government Irrigation Works The proportion of the culturable area pro--2 tected by wells . The proportion of the culturable area protected by private or village works - 3

2. Character of the soil.—There are two main arieties of soil: 'goradu' and black cotton soil. The

commonest soil is the gorads or sandy light coloured alluvial soil. This varies extremely in fortility, principally from the presence of sand in greater or less proportion, from being capable of prodocing anly scanty crops of the commonest cereals to a degree of productive power probably unsurpassed by soil in any part of India. It differs from the kali or black cotton soil especially in its power of retaining moistine being far inferior, and thus almost all the creps which are mised in it without artificial irrigation are kharif and reaped inmediately after the moneon. It requires not of frequent and copious manuring to prevent its productive power from being calmosted.

\*\*Rical cattan soil is also found over large areas of the

Black cotton soil is also found over large areas of the Mace extent for the aid took wheat. It is intrinsically more valuable than garned soil, or it requits its own strength with merely the aid of rain and atmospheric air it does not stand in need of regular manuring and is much more retentive of moisture.

Mr. F G Peatt 4 Dec. 01. Mr. F. G. Prait. 4 Dec. 01.

- 3. Ordinarily there is but little demand for water in Gujarat during the senth-west menseen. But one exception to this general statement must be made in the case of the rice lands. It is chvious that rice cultivation with an average rainful of about 30 inches must be nt all times more or less presented and speculative. If the distribution of the rainful is at all irregular, the crop must suffer nuless assisted by artificial irrigation, and the frequently recurring failures of the later menseen rains in September are a frequent cause of the failure of the crop.
  - 4. Ahmadabad District.—Total area irrigated by wells—
    - (a) In ordinary years 44,100 acres. This is the average of the four years (1895-96 to 1898-99).
    - (b) In years of drought (1899-1900)-92,445 peres.

Number of now wells constructed annually during the last five years is as fullows:—

			Tor	'AL	•	2,610
1909-1901.	•	•	•	4	•	512
1899-1900.	•	•	•	•	•	1,915
1898-1899.	•	٠	•	•	•	63
1897-1808.	•	•	•	•	•	65
1896-1697.	•	•	•	•	•	õõ
						Rs.

But these figures cannot he accepted as reliable or authonitative as they have been collected in a hurry from the various talukas of the district, and it is doubtful if the figures of kachcha wells have been given in all case.

figures of kachcha wells have been given in all cases.

5. The extent to which construction of wells has been assisted in the Abmadahad District by advances from Government is shown in the sub-joined table:—

						iniount of Advance.
						$\mathbb{R}_{5}$ .
1890-1891.						7,775
1891-1892.	•	•	•	•	•	8,400

In recent years the concession has been made to wellconstructors of a guarantee against any increase of assessment on account of the improvement of the land effected by the construction of the well.

## II. A.—General.

- 1. The answers below written are based upon my experience uf the Kaira District and of portions of the Ahmadahad District.
- Ahmadahad District.

  2. The average rainfall in the Ahmadahad District in the years from 1870 to 1878 was 32'13 inches. "The rainy season generally begins in the latter part of June, expends its greatest strength in July and gradually loses furce till its elose about the end of September" (Ahmadahad Gazetteer). I am numble to give mouthly averages, but rain at any time except the four months' (June—September) period is rare and not to he canned un.
- 3. I know of no obstacles to the extension of irrigation arising from any of the causes classified under heads (1), (4), (7), (6) or (9).

Head No. 2—In the districts of Gujarat owing to the large destruction by fumine of agricultural cattle it is possible that this obstacle may prevent any great extension of well-irrigation: but at the same time I think that few of the useful well-cattle were allowed by their unwars to perish, and the cattle that died are being replaced year after year hy private enterprise and by the help of Government takavi advances.

The insufficient supply of manure (head No. 3) is without doubt the main obstacle to the crtension of irrigation: and this is the reason which is most commonly assigned by the people themselves. The surplus of manure is only

sufficient for a limited area in the home fields near the village site. These hems fields are naturally the first to be irrigated, because they are the most accessible for labour and supervision, hesides heing probably of a hetter quality of soil originally. Lack of capital for the initial expanditure (head No. 6) doubtless operates to some extent to provent the extension of irrigation. Thus a cultivator of one of the backward classes, e.g., a Koli or Dhurla, would not find it easy to find the capital for sinking a well or the fundator carrying on the culture of irrigated crops. But lack of enterprise would in most cases prevent among such classes even the desire for improved cultivation, for in a normal season the cultivator would without irrigation raiss a crup which would amply suffice for his maintenance.

- 4. Land which is irrigated from wells ur other works constructed by private capital is permanently exempted from enhancement of assessment on account of the irrigation. Thus land, which during a term of survey settlement may have been converted from dry orop land to garden land would on the introduction of a revision survey continue to pay the dry crop rate. I consider that the existing provisions in this respect are sufficiently liberal.
- 5. Leans under the Land Improvement Act are now being taken freely in Gujarat; their popularity has enormously increased owing to the familie and the scarcity of the last two seasons.

I see no reason for recommending-

- (1) reduction of the rate of interest; or
- (2) remission of the interest; or
- (3) partial remission of the advance; or
- (5) extension of the peroid for repayment; or
- (6) grants-in-aid.

I would recommend, in the case of failure of the attempt to obtain water, total remission of the amount ascertained to have been actually expended. I am of opinion that the existing conditions under which such loans are made are quite liberal enough, and I fully endorse the views of the effect that the success in the administration of the Act depends upon men, not measures.

6. I cannot answer the first half of this question. No such case has ever come to my notice. In a portion of this district, viz., the South Daskrei tract and the adjacent Daskrei tract of the Kaira District, where rice is the principal crop, there is a strong desire that this crop should be secured by a supply of canal water in the latter partion of the monsoon. The crop frequently fails altegether or is severely affected for want of rain at the end of the monsoon, and a cannl supplying water in September would be an immense hoon in such tracts. Complaints of the deficiency and suggestions as to the moans of supplying it are frequently made by the oultivators themselves.

#### D .- Tanks.

- 23. (1) The tanks in the Ahmadahad and Kaira Districts are supplied with water by the mensoon rain and in the majurity of cases have little ur no catchment urea. The number of tanks whose water can be made available for irrigation hears but a small proportion to the whole.
- (2) The water is distributed to the land in a few cases by direct flow and in the great majority of eases by lift, the water being lifted hy manual power or hy hallocks from one pit to another up the incline until it has been brought above the level of the fields which it is intended to irrigate.
- (3) I cannot asswer with certainty on this paint, having only known the Ahmadahad and Kaira Districts in seasons of drought or senity rainfall: but I believe that even in normal seasons the tank water-supply is rarely available for rahi crops.
- (4) The area irrigated varies with the size and nature of the tank. The maximum area irrigable would, I think, be perhaps 250 acres from an ordinary village tank: the average would perhaps be about 50 acres: but I am not nt nll sure of these figures.
- 24. (a) In a year of ample rainfall tauk-irrigation would undoubtedly render it possible to enlivate two harvests instead of one; but little use of the tank water having been necessary for the kharif rice crop, the surplus would be available and would be used for radicalitical, wheat or harley ar grain.

The supply in tanks being nearly always dependent on the monsoon and therefore being uncertain, it appears to me that tank-irrigation could not have the effect of leading

Mr. F. G. Pratt.

4 Dec. 01.

to a permanent substitution of a more valuable crop or variety, e.g., Kamod rice for Sutareal rice (Kamod is about 25 per cent, more valuable).

(b) In a year of scauty rainfall, i.e., scauty towards the end of the mensoon, the valoe of irrigation tanks properly kept up may be estimated by a consideration of the following extracts from the revision Sarvey Blue Book of the Dholka Talula of the Ahmadabad District.

Captain Wingste, Reseaue Survey Commissioner, wrote in 1853:-

"The rice lands are for the most part dependent on tanks which are quite dry in the hot weather, and unless the rains fall sufficiently in the early part of the moneoco to fill them and to enable the cultivators to sew the nursery beds from which the young rice plants are sub-equently transplanted into the fields, rice crops cannot be raised at all. Ample falls of rain later in the senson though sufficient to sill the tanks are of no avail, and as the rarry fall is very uncertain, it is quite a common occurrence for the centire rice lands of a village to be left waste, so common indeed as to be a characteristic feature of the agriculture of the district. In illustration of this I may mention that out of the server villages experimentally settled by as last season the rice lands of two, Itanesar and Degamma, were left entirely uncultivated, though Degamma is one of the finest rice villages in the district. This cril is too organizated by the customs obtaining among the cultivators. Unless a tank fills enficiently to admit of the irregation from it of the whole plot of rice land lying below it, the custom in some villages is to provent the cultivation of rice on any part of it so as to avoid dispotes about the right to the water."

And Mr. Rogers as Settlement Officer wrote in 1851:—

And Mr. Rogers as Settlement Officer wrote in 1851 :-

"I explained in a former report to the late Revenoe Surrey Commissioner that the rice-growing lands of the district were situated entirely under tanks or in low situations where water would lie in the monsoon: their value, therefore, entirely depends upon the supply of water thoy can calculate upon receiving upon an average year after year. Even, however, nuder the most favourable circumstances there ocenr in Gojarat such seasons of drought that these lands cannot be cropped with rice."

Forther on in the same letter be writes :-

"Another great size qua non for the development of the resources of the district is the improvement of its means of irrigation. Rice oultivation could be effectively maintained and improved by attention to the despening and clearing out of tanks."

- (c) In a year of drought no tank in Gujarat would be of any ose for Irrigation.
- 26. I have known the tank-supply to be eked oot in seasons of scanty rainfall by well-irrigation.
- 20. Sofir as I know, thore is no regular provision either on the part of the cultivators or on the part of Govern-

ment for the maintenance of tanks useful for irrigation. The people when left to themselves will allow even good tanks to fall into disrepair and roin from want of co-operation and enterprise. Some of the larger Irrigation tanks are occasionally repaired by the Public Werks Uepartment, but I do not think that systematic attention is devoted to them. The smaller tanks are left to themselves.

33. The silting up of lanks is a frequent scores of complaint. The villagers do not combine to carry out clearance work themselves, but they are often willing with official assistance to raise subscriptions in the village for the execution of repairs by official agency.

34. (2) The supply is liable to fall or to become much reduced in years of drought, such as those which Gujarat is now experiencing.

(3) The average cost of construction I would put at Rs. 350 or 400.

- (5) The water is raised in water bags drawn by bullocks.
- (6) The arcrage area uttached to and commanded by a well I woold pat ut four acres if the crop exclusively depends on the well-water.
- 35. In a year of seasty rainfall a well is useful in two ways for rice :-
  - (1) When rains are late at the beginning of the season it enables the well-owner to prepare his rice nursery beds curlier than the man who has no well: and his rice thus can be transplanted earlier and get the benefit of the rains as soon as they fall.
  - (2) Whou rains are scanty at the end of the sensee it enables the well-owner to give his rice crop the last waterings which may make all the difference between a total failure and a normal crop.

38. (1) Yes.

In some cases wello are impossible in an entire village, because they are sure to be salt. In many cases it is impossible to know before digging that the water will not prove to be salt. A salt well may be mot with 20 yards away from a sweet oue.

- (2) I have heard of cases where the attempt to construct a well has had to be abandoned owing to the soil being so sandy that the sides of the well fell in.
- 40. Tempriary wells are commonly used in some parts of the Ahmadabad District, especially for rabi cultivation, in alluvial river side lands or in river bods. They are of great use especially, I think, for rearing fedder crops, and for this purpose were largely resorted to le the recent famlue.

Their construction could be encouraged by liberal grants of takavi, as the cost of construction is trilling.

- 1. Q. You are Collector of this district !- Yes.
- 2. Q. How long have you been in here!—I came here in May 1899.
- 3. Q. From your printed memorandum it appears that you have been in Kairn too?—I was there from November to May. My connection with Gujarat begins with May
- 4 Q. Where were you before that?—Before that I was in the Decean, in Sholapur and in Sindh.
- 5. Q. You were in Gujunt through the whole of the famine?-Yes.
- 6. Q. You say the columble and of this district is 1,723,001 acres; about how much of that is coltinated?—
  I could not say without referring to the statistics
- 7. Q. Are the people in the habit of leaving nach land faller ?-I could not say; I only came here during the famine, and I think a great deal of land lies follow on a count of the famine.
- S. Q. The amount of culturable area covered by Government works is a mere begutelle? -- Yes, a very insignifienut proportion.
- 9. Q. (Mr. Muir-Maclenzie)—That does not include tank lands?—No; but I don't think that would increase the area by more than I or 2 per cent.

- 10. Q. (Mr. Muir-Mackenzie) There are tanks for rice irrigation? Yes; they are not included in my figures.
- 11. Q. (The President)—You say in your noto that there has been a very great increase in the number of wells in the last five years; in 1890-97 there were 55 wells, and in 1900 there were 1,115 wells?—Yes.
- 12. Q. Takavi advances were giren in the same proportion?—Yes.
- 13. Q. In 1899-1900 the takuri advances amounted to Re. 1,41,000?—Yes, for land improvement.
- 14. Q. Not for seeds f-No; for land improvement; seeds and bollocks would not be included.
- 15. Q. What would be included f-Almost entirely wells.
  - 16. Q. There was an enormous increase of wells ?- Yes.
- 17. Q. Are temporary wells incloded?-Yes, they are.
- 18. Q. I suppose there is a large proportion of these temporory well-?—Yes; I could not say how many.
- 19. Q Ther woold not require much takavi advances, because kacheka wells east so little P-Yes, the bulk of money would be for palka wells.
- 20. Q. You say in paragraph 5 of your note that "you see no reason for recommending a reduction of the rate of

Mr. F. G. Pratt.

- interest or remission of interest." That is as regards loans for improvement?—They do not require any inducement. I don't think that the knowledge that the interest would be reduced or remitted would be a great inducement. What they require is a prompt disposal of their application and prompt receipt of money; they don't very much core what the rate of interest is.
- 21. Q. Csn you suggest any procedure for the prompt disposal of their requests ?—I do not think the system can be improved.
- 22. Q. How long does it take under ordinary circumstances to get actual payment?—There are considerable dolays; a man may get the money in five months if he is fortunato; I think seven is a fair average.
  - 23. Q. Could that not be improved ?-No.
- 24. Q. The man can go to the sourcar and get his money at once over the counter?—Yes, if he has credit. There was so much delay recently as the amount of work was enormons, I do not think it would take so long in ordinary years.
- 25. Q. Do you give cheques?—No; that is not done here; the man can get the money from any Treasury.
- 26. Q. (Mr. Ibbetson)—Do you think inquiriss about the rayats' solvoney and encumbrances account for the delay in his getting the money? Supposing the inquiries were ahandoned, would it make any difference?—Yes, certainly.
- 27. Q. A substantial difference?—Yes, undoubtedly; but none the less is the enquiry necessary.
- 28. Q. Why? seeing that the loan is the first charge on the land?—Because it might be that the man is not solvent, or that on gotting his loan he is likely to misapply it and the amount might be irrecoverable.
- 29. Q. You always make the loss depend on the seenrity?—Yes, that is the object to which our inquiries are directed. We eramine the land he offers as security and ascertain the solveney of the man.
- 80. Q. But the loan is the first charge on the land?—Yes, by law; still we must make sure that the loan is given on sufficient security and therefore we have to make inquirios.
- 31. Q. Is it necessary to enquire into the solveney of the maa and the encumbrances on his land if the loan is to be n first charge?—I think it is necessary; it is doubtful whether the land is not encumbered and whether the Government advance will not he in danger though it is the first charge.
- 32. Q. (The President)—You say in paragraph 6 "I have known the tank supply to be eked out in sensons of seanty rainfall by well irrigation." Is that systematically done on these smaller tanks which belong to villagers?—I think so, but I have not seen many cases of successful rice oultivation in Gujarat where I have had only famine experience.
- 33. Q. In paragraph 38 you say "In soms cases wells are impossible in an entire village, hecause they are surs to he salt." Does that held good in each of these districts of Ahmadabad?—Yes, in a great many of the villages.
- 34. Q. Are there any villages that have not got wells of some kind with drinking water?—Yes.
- 35. Q. How do they manage?—After the drinking supply has become absolutely unpetable they have to clear out.
- 36. Q. (The President)—Would you advocate the districts having at their disposal bering apparatus for the use of the villagers when they want it?—I do not knew. I have found that the people are not able to work it. On the other hand, a boring apparatus in this district is worked by people of a particular class who have a special knowledge.
- 37. Q. Is that a drill for boring?-Yes; some simple contrivance.
- 38. Q. (Mr. Ibbetson)—Do you refer to deepening the bottom of the well?—Yes, to increase the supply-
- 39. Q. (The President)—Is it the custom before sinking a well to make experiments by boring ?—No.
- 40. Q. With your knowledge of this district and of the terrible times through which it has passed, what do you consider would be the best measure that Govern-

- ment can take to protect it from a like suffering in futuro?—The first measure I should take to relieve the most serious distress caused by entire and complete drought would be, if possible, to construct big canals, such as the Saharmati. That would afford considerable relief.
- 41. Q. From what you know would you expect it to carry sufficient water during times of dranght?—If there is no emplete failure of rainfall, I am not sure it would; but if it is a partial failure, it would save a considerable area of rice. The next question is of making small irrigation tanks which, if kept in proper order, will be extremely valuable in irrigating considerable areas of partial drought.
- 42. Q. As a rule are these tanks in had repair?—I think a great many of them are in disrepair.
- 43. Q. Do you know mny instance of people trying to help themselves in the matter of repairing these tanks?—Yes; I know of an instance (I have read of it in the Revenue Settlement Report) where three villages combined and repaired their tank and they alone in the whole rice tract did not have to get remissions.
- 44. Q. (Mr. Ibbetson)—In what year was that?—About 1882.
- 45. Q. (The President)—From the lessons of the last three years would it not be natural to expect some similar action on the part of the villagers in times of drought?—I don't think they are likely to take the initiative thouselves; it will have to be done by some superior authority. The people would quarrel; Government officers should take the matter in hand.
- 46. Q. What do you consider the most suitable form of relief work ?—In this district, small irrigation tanks.
- 47. Q. The existing tanks are not, I think, repaired in Isrge numbers?—Not very largely. In the big famine of 1899-1900, I think very few, if any, were repaired; I should prefer to spend all the money on these tanks rather than on other useless works. If tanks are repaired beforehand they would be very useful in times of drought.
- 48. Q. (Mr. Muir-Mackensie)—Would there be no difficulty in the supervision of such works?—Not if the plans are exefully prepared beforehand in every detail. We did it to a certain extent in the Kaira district last year. I think the thing could be managed if we had every thing to a certain extent eat and dry beforehand.
- 49. Q. (The President)—Have you got a relief programme for your district?—Yes; quite sufficient for our requirements, we do our best in pushing all our schemes, but there are a great many objectious; each one of them requires a great amount of attention, and I have heard complaints about the Puhlie Works Department subordinates not having sufficient organization.
- 50. Q. What would you do chiefly? Dig up silt and repair bunds.
- 51. Q. (Mr. Higham)—Have you considered the Sabarmati schems?—I have read it through; it is an excellent scheme so far as I understand it.
  - 52. Q. Is it on the right bank of the river ?-Yes.
- 53. Q. Is there any scheme ou the left bank?—On the lsft bank ws have the Khari schems that waters rice lands.
- 64. Q. Suppose the eanal is taken higher up the river, would it affect another part of the district?—I think not; nerth of Sanand is the Gackwar's territory.
- 55. Q. (Mr. Ibbetson)—You say that the best use to which relief labour could be put is the clearing of the existing tanks P—Yes.
  - 56. Q. Would you extend them?—Yes, if possible.
- 57. Q. Do you know how far it is possible !—Certainly, it is possible to some extent, because in the Kheri river some excellent new sites have best discovered.
- 58. Q. Do you think they might he expected to bring Government a reasonable return?—I could not express an opinion without seeing the figures.
- 59. Q. You say in paragraph 3, "it is obvious that rice enlitivation with an average rainfall of ahout 30 inches must he at all times more or less precarious and speculative. Do you refer to a whole cycle of hed years, or are you speaking of normal years?—In normal years also it has always been so.
- 60. Q. The tanks may be expected to reduce the risk?—Three years out of five certainly; last year there was

a rice crop under tanks; there was no other rice reaped in the district.

- 61. Q. You say, "the area irrigated from wells is more than doubled in a year of drought." Is that mainly owing to kacheka wells made on account of the drought, or is it due to wells that were ordinarily disused being brought into use?—Both causes contributed, I think.
- 62. Q. Do you know the number of wells that are not crainately used?—I think a considerable proportion are not
- 63. Q. You say that su "insufficient supply of manuro one of the main obstacles to the extension of Irrigation." is one of the main obstacles to the extension of Irrigation."
  Be you know from your own experience, or from what
  recople told you that irrigation does harm if the land is not
  sufficiently manused?—It is a very common statement.
- 61. Q. Yoo have no personal knowledge on the subject !- No.
- 65. Q. (Mr. Rejurated Aldle.)—Do you know of a petition to the Government of Bombay from the people of Dholka, suggesting that an irrheation canal should be constructed?—I heard talk about it the other day.
- 66. Q. Is the project under investigation f-Yes. 67. Q. In paragraph 4 you say "the urea irrigated is 22,000 acres;" is that more than double the area ordinarily irrigated?—A great deal of that was for fodder crops.
- 03. Q. Do you mean that more than double the area was irrigated !- Yes, quite so.
- 69. Q. How do you account for that?—By an increase io the urea and an enormous extension of fodder crops, which require less water.
- . 70. Q. (Mr. Ibbelson)—A good many non wells wore made?—Yes.
- 71. Q. (Mr. Rajaratna Mdlr.)—You refer to the insufficient supply of maoure as being the main obstacle to the extension of irrigation. Are green leaves used for manuro in this Presidency?—I have never heard of it.
- 72. Q. In paragraph 4 you say "land which during u term of survey settlement may have been converted from dry crop land to garden land would on introduction of a revision survey continuo to pay the dry crop rate?"—Yes.
- 73. Q. One witness told us yesterday, that it is likely to be charged on account of sob-soil advantage?—It is always liable to that whether it is dry orep or garden crop under the existing law; any land which has sub-soil facilities, whether they are utilized or not, is liable.
- 74. Q. Does the fact of sub-soil under wells affect the question of increased assessment f—It does not.
- 75. Q. Not even at the next Revision of Settlement?-No.
- 76. Q. Suppose a man digs a well now, will be not be liable at the next revision to pay an increased assessment on account of the sub-sell advantage?—No
- 77. Q. You say "the success in the administration of the act depends upon men, not measures." Would it not ndvisable to employ special officers to distribute leans? Would it not be Yes, on extraordinary occasioos; not in ordinary times.
- 78. Q. If on extraordinary occasions a Doputy Collector could be appointed to distribute loans on the spot, would that tend to expedite matters f-Yes, that would, certainly.
- 79. Q. (Mr. Muir-Mackenzie)—A special officer is actually employed?—Yes.
- SO. Q. (Mr. Rajaratna Mdlr.)—Who collects the canal revenue f The village officers.
- S1. Q. If the village officers do the work is any debit made on account of collection charges !- 1 could not say; I de not know.
- 52. Q. I suppose a village cess is charged in this Presidency i (Mr. Muir Mackenzie replied that, except in Sind, no cess was levied in the Bombay Presidency on account of village establishment which was paid out of the Provincial revenue.)
- bd. Q. How many irrigation taoks are there in the Ahmadahad District i-I do not know, there must be many hundreds; probably 400 or 500.
- 84. Q (Mr. Muir-Maclenrie)—Not something like 1,030?—There may be.
- 85. Q. (Mr. Rajarzina Mdlr.)—Does not your Administration Report tell you that i—No.

- 86. Q. I do not understand the difference between rice tanks and field tanks? Mr. Muir-Maclenzie-They were separately treated before the survey was made; we have no separate headings now.
- 57. Q. Mr. Beale recommends the construction of field tanks, and for that purpose he also recommends a survey. Are there any field tanks?—Yes, there are.
- 88. Q. (Mr. Muir-Mackenzis)—Have you had any practical experience of these landhsf-Yes.
- 80. Q. Would they be a suitable work for famine reliof?
  —Yes; very suitable because of their simple construction;
  very little technical knowledge is required, any man who
  has some experience can manage such works.
- 90. Q. You say that tanks could not be constructed without a considerable account of technical knowledge and experience? —I think so; I should be very sorry to trost it to Local Fund Overseers; they have very little experience of irrigation; practically none.
- Ol. Q. You would prefer that the work be done by Government?—F would prefer that the scheme be prepared by the Public Works Department; the Local Boards would then be competent to carry it out.
- 92. Q. Would you make the rerenue arailable to the Local Boards?—That could be done; I have not considered the subject, but I see no objection to it.
  - 93. Q. The Board's revenues are very inelastic !- Very.
- Dt. Q. They depend entirely on the Land Reveous which cannot change for thirty years?—Yes.
- 95. Q. An additional conrec of iocomo would be u great
- 96, Q. Have yoo any experience of the water-logged areas?-No.
- 97. Q. Here you heard complaints regarding these drains ?—I have heard complaints that the drains were not sufficient to carry off the water.
- 93. Q. Were you able to form any judgment of the area for which the drains were sufficient?—The drains had not done their work; they were ntterly incomplete, and only half finished.
- 99. Q. If completed, would they have been visioble ?-
- 100. Q. Io years of ordinary rainfull?-They are liable to be flooded.
- 101. Q. Do yoo believe that in years of ordinory rainfall such drains might be extended f.—I do not know how; I have very little experience of water-logged areas; I have seen very few.
- 102. Q. (The President)—Have you reason to believe that if they are dismaed, the mischief will go on increasing P—No, I read that in old times very serious damage was done by flood.
- 103. Q. (Mr. Muir-Mackenzis)—You have not heard complaints that the draios damaged the adjoining lands by carrying away surface soil?—No. -You have not heard
- 104. Q. Do you think that for the construction of wells the people would prefer that Government should pay the cost of the well and charge additional assessment instead of charging interest and taking back the principal?—The permanent assessment would be most unpopular; anything in the nature of a permanent enhancement would be so. He would sooner berow the money and make the well himself.
- 105. Q. Do you advocate a considerable extension of the period of instalment ?-I think 20 years are sufficient.
- 106. Q. (Mr. Ibbetson)-What is the period in ordinary practice F-Teu years.
- 107. Q. (Mr. Muir-Maclenzie) Do you think a longer period for repayment would be better?—Certainly.
- 108. Q. The rayat would like to pay it in 50 yearsf-That is perhaps going a little too far.
- 109. Q. Do you think the people would like that ?-I think they would.
- 110. Q. Would that not be practically a permanent assertment?—Yes.
- 111. Q. Your idea is that the people would prefer to have the period of repayment extended from 10 to 20 years to having 50 years or an indefinite period. Suppose no remitted the money and charged not accomment t—I think a permanent assemment would be a great drawback.
- 112. Q. (The President)-Would it lower the value of the land?-Yes; I think that the man would prefer to raise the money himself, I am sure he would prefer the

Mr. F. G. Pratt

4 Dec. 01

Ma. F. G. Pratt. Dec. 01.

repayments in good years, he would probably pay larger instalments and get rid of the debt sconer; mything meaning enhanced assessment would ereate mistrust.

113. Q. (Mr. Muir-Markenzie)—You would prefer not to see the experiment tried?—I think not.

114. Q. We have been told that the extension of wells is limited by the manurial supply ?- Yes.

115. Q. Possibly you can get over that difficulty by giving a man an advance for wells and also for additional cattle at the same time?—They would not increase the stock of cattle for the sake of manaring their land.

116. Q. A man might bny cattle or he might bny mannro with the ndvance given for manare ?-They do not do that to my knowledge.

117. Q. Is there no chance of getting night soil used. It is used in Ahmadabud?—I think that could be done.

118. Q. (Mr. Ibbetson)-You say that mything in the way of a pormanent assessment would create mistrust? - Yes. 119. Q. We have been told by several witnesses that people do not feel quite sure that if they make wells there will be no enhancement of assessment?—I do not think there is any such feeling. .

120. Q. If the assessment is raised, you could tell the occurants that it is not on account of private improvements?—Only very few would understand the grounds on which the assessment was raised.

121. Q. You do not think there is may feeling that the private improvements are assessed f-I do not think so and hare never heard that such a ferling exists.

122. Q. (Mr. Muir-Mackenzie)—If a tank is muce people do not object to increased assessment on their lands because they obtain water; why should they object in this case?—I think the cases are different. Tanks and irrigation canals are not quite analogous to wells.

123. Q. They are both made by Government?—I think the wells are much more in the nature of private property.

Mr. B.Kisparam. WITNESS No. 16 .- Mr. BRINDHAI KIBFARAN, Talakdari Settlement Officer, Gujarat.

Memo. by Witness.

I.—Character of the Soil.

Gnjarat soils are of three chiof kinds :-

(a) Kali or cotton soil, a black loamy elay characteristic of the Tapti and Nerbudda watered Broach and Surat districts ; sweet alluvial plains.

(b) Gorat .- A light fawny-coloured sandy loam characteristic of the Mahi and Saharmati valloys in the Knira, South Ahmadabad, and Paneh Mahals Districts; presents the highest type of cultivation in Gujarat (in the tract called Charotar about Nadiad).

(c) Goramti.—A reddish loamy clay, peculiar to parts below the Western Ghats and to the Gogha and Modasa hille.

Peculiarities of locality and climate divide kali and goral, each into six variotics, which account for the varying fertility of different parts of Gujarat.

Kali or black soil has six varioties :-

(a) Kali or regar -- Pare black, argillaceous loam; free from stones or pebbles; abounding in carbonates of lime and unugnesia-a long onduring and fertilo soil-Broach plain.

(b) Kali Khokhar-Greyish black, argillaceous, resting on kankar, intermixed with nodules; oasily affected by changes of weather, becoming either very wet and stiff or very hard and fissared; sultable for wheat, juari, and · riec.

(c) Kali-bara .- Snuff-coloured and friable; containing chloride of sodium, or carbona'o of soda when deep; not unsuitable for cotton, but more adapted for wheat.

(d) Kali Besar.—Dark brown; near trappean rocks with small disintegrated pobbles; with more of peroxide of iron than kali regar, but less of magnesia and lime; much coarser in texture; valuable black cotton soil for gurden cultivation; better for superior rice than kali

(c) Kali-Matodi. - Sodimentary; colour from grey to black; collects in rice beds and low-lying tanks; highly valued as top-dressing for light red garden soils.

Kayarda or kyari.-Not exactly soil, but the propared hed in which rice is raised with or without irrigation; colonr black or red; valuable, according as rotaining water to ond of rice season.

These varieties of black soil are wet and heavy in rains; These varieties of black soil are wet and heavy in rains; but dry, hard, and fissured soon after; discretion and experience needed in working them advantageously. Superficially retentive; they contain springs in great depth, often with brackish water, unfit for irrigation; bad for bedges and trees, and not fit for perennial cultivation. But irrigation and careful husbandry have made even three colleges are the of high cultivation that contains a superfict of the colleges. thrse soils capable of high cultivation.

Gorat soil varieties have characteristics opposed to kali soils.

The six varieties are-

(a) Goradu proper, composed of disintegrated particles of sandstone, limestone, and secondary rooks; called retal, rana, mor-rana when incoherer; and mardi, when much mixed with nodnlnr lankar; colour varying from light fawn to rich brown; and texture ranging from mero drift-rand to loam; contains lime and so not barren, hat very fertile; if not separated from an earthy sub-soil called goramts, capable of great improvement under irrigation and proper tillage; shows superior cultivation in manured fields near towns and villages; best adapted for dry-coop eerea's, with irrigation produces varieties of regetables.

(b) Goradu-besar is goradu proper, but leamy, full of fructifying properties of blook and light soils combined; its silicious and calcareous components are reduced to fine mould by moisture and weathering, and decayed matter from trees, hodges, and artificially. Trees, bushes, nnd potash loving plants grow in it readily and vigorously; possosses alkali and therefore, specially valuable for tobocco, and the triennial variety of cotton.

(c) Gorat-marva, found ohiefly near banks, or in deserted beds of rivers; shows a micaceous scintillation; free from pebbles; varying in colour from light brown to chocolate; very absorbent jet retentive; not hard even when dry, nor muddy when wet; rich in organio matter; generally found of uniform toxture and quality to a great depth; has sweet water, found a few feet below anriaco, and it is therefore called untural bagayat or garden land, whether irrigated or not. Withent any following, all the most valuable orops are raised upon it in rapid uncession.

(d) Rakhdi-ralu, also called puran and gabhan, is the soil of old village sites, rich in nitrate of potash, though poor in appearance; it yields tich crops of grain, especially tol acco, the latter mostly without irrigation.

(c) Gorat, heing the red and yellow clays of Pardi in Surat and Gogha in Ahmadahad; of laterite and limestone formation like the Konkan soil; in lower levels, it passes into the kali khokhar variety, and is best snited for rice cultivation.

(f) Bhatha or alluvial, is a fine micaceous chocolatecoloried learn munally deposited in the loops of rivers
and selects, charged with the fertile ingredients of distant mind using the second with the territor ingressions of distant mplands and villages; its best quality is free from sand, and possesses richer and lighter particles in solution; thus it is naturally fertilized, oaslly cultivated, and in its desp proist hed it readily matures without irrigation most valuable garden produce.

All these red varieties are hest for general cultivation; contain springs at no great depth; give better return on capital than black soils, show perennial verdare, with plenty of trees, hedges, and universal caltivation.

Besides kali, gorat, and besar, there are, of peculiar soils, along the Surat coast, the marshy lands called khar and khajan; and in the Pardi sub-division the soil is more like that of the Konkan than of Gujarat. Kaira has near Matar, salt or khar lund; in Kapadvanj and Thesra, waste and ill-drained mal or upland, also found in Godhra; and waste had had or upland, also found in Godhra; and near the Muhi, a coarse, shallow and dry soil called mardi.

Throughoat Gajarat, the light alluvial said rich gorat soil is superior to the kali or black soil.

As compared with other districts, Surat is conspicuous for the large proportion which its fertile soils hear to intrinsically poor soils.

Of the entire enlturable area of Surat, 18th is black, 12th is light and 18th is medium, or besar soil.

4 Drc. 01.

In Broach 18th is l'ack, with crops of rice, cotton, wheat miliet and juari. Of the remaining 7sth of goral or light soil, 7sth yields cerea's, pulses, and garden stuffs; and 15th is the rich allarial blatha in which all crops, especially tobacco and castor-oil plants, are raised.

In Knirs, the light or gorst prevails, varying from loos! fawred yellow sund in fields near the Saharmati and Mahito rich light brown mould in Central Kaira, and attaining to rich light brown mond in Central Kaira, and attaining perfection in Matine. Besar soil, varying from henry sanda to light class is pretty generally distributed in small tracts over the whole district. The black soil is poor, scarcely ever deep, and most of it mixed either with soda or lime stone. Allowin bhatha, chiefly found near the Vatenk, yields every year without dressing or fatlow rich crops of tobarce, safflower, and other garden produce.

iobace, softlower, and other garden produce.

In the Panch Mahale bhatha, mal goradu besar, and kali are all found in different parts. The besar is well suited to rice, kedra and coaree grains. Kalol has much of goradu. In South Hulol are stretches of rich black soil. Except stony hill ridges and patches of shallow gritty and red and dry black, the suil of the eastern talukas of Dohnt and Jhul-d, both light and black, is perhaps, from the abandance of underground stream water, of very high quality. The light varying from fawn to reddish hrown, yields two, and, if watered, three, crops a year.

In Almadahad black sail is found chiefly towards the

yields two, and, if watered, three, crops a year.

In Ahmadabad black soil is found chiefly towards the west and light in the east. But in many parts both occur within the limits of the same village. Thu black soil is much impregnated with alkali or Lhar. The light soils are well supplied with springs which candle the rayat, at very little cost, to have rabi or winter, and hari or summer, crops after the Lharif harvest. Dhandhuka and Dholka have low bara lands, too moist for cotton, but saitable for rich wheat after rains subside. The bhatha soil ahand the Submrasti is most fertile. To the north-east of Parantij is a red stony soil favourable for Indian-corn. In the high parts of Goghn and Rapper it nocumulates in a rich loam that yields good crus of sagarcane.

#### II.-Irrination.

Irrication in Gujarat is from taoks rivers and wells. According to the method of lift and delirery, it is colled (1) Patasthal, (2) Methathal or (3) Dickadiat.

- According to the method of litt and delivery, it is called (1) Patasthal, (2) Methathal or (3) Dhekndist.

  (1) Patasthal is by gravitation, as from canals and dama built to confine the water in a pool, until it goes sufficiently high to flood the traot mean to be irrigated as in khari villages, or fields below the tank lovel, from which it is received through a sinice gate, or more often, sinply by cutting the embankments. If the water has to be russed only four or five feet, jails are used. There are of three vinds: supda, chorsan, and lever. The first is a rough and rady process for utilizing temporary pools of minewater. It consists of a shovel-shaped basket or supda utiched to two ropes worked by two men swinging the water by a jerk to n few feet higher channel. The second consists of a wooden trough, two or three feet wide, and eight to ten feet long or leather distended over a bumboo frame-work of the samo size called chorsan or jails worked by n heavily weighted lever on a cross frame of poles. The smoot of the trough resting on the higher channel, the body, to which a rope from the lever is attached, is pressed into the lower reservoir, and is a nisted up for discharge by one or two men. In the third, a similar lever, working on a single pole like a yard mot mast of a ship to which a hacket is attached, is used to raise water from shallow wells.

  (2) Mothathal for raising water from wells and rivers by
- (2) Mothsthal for raising water from wells and rivers by leather bage called ramio or sundhio kos. Somotimes, the Persian wheel, called rekent, and the capetal barrel orn used. The ramie kos is a whole hallock-hide, with cut corners, pursed with leather thongs to astont iran ring affects to eighteen inches in diameter. It holds from fant to six cubic feet of water. It is attached with a swired chain to a stont cow-hide rope, and drawn urer a wheel to a stout raw cow-hide rope and drawn over a wheel moving between two sloping prope resting an a beam sapported over the well by upright posts. It is drawn by a single prin in hallocks descending a slope, with the backet rope attached to the tarila yoke. On the leather bag reaching the terel of the discharging trough, it is bumped down and callapsed. A man on the trongh gives a song signal when the hallocka are to start, and when the rope is to be detashed from the yoke, which latter the driver does by pulling out a taggle or pin. (2) Mothsthal for raising water from wells and rivers by

The sundhie differs from the ramie is having its suont sum on to the bog, and an additional rope attached to the smoot working ou a roller at the base of the platform. Both

sanni rope and lift, attached to the platform are so arranged that, on the bag reaching the level of the trough, it emption of itself. In the rando the hullocks have to be detached from the bottom of the incline, turn round, and walk up to be re-attached. In the xundhio the bullocks me not detached and have to slowly lack up the incline.

(3) Dhekudi is the common apparatus of a wheel, erected on the high perpendicular vergenin river bank and a single pair of halleess draw up the los elther rumio or sundhio according to the depth of the water. The dhekudi can only be used where the stream is immediately henesth a perpendicular bank, or led there by connecting channels cut through the bed of the river.

#### Garden Cultivation.

The cultivated londs in Gujarat may be classed under three heads:—Jurayat or dry-grop land, Dangar or rice-land, and Bagayat or gurden lands.

The proportion of irrigated to the unirrigated land is zoth; and of garden to dry-crop land in zoth. Dangar or rice-land comprises zoth of the total cultivated aren; and irrigated to unirrigated rice-land is zoth.

irrigated to unirrigated rico-land is \$1d.

For n province so fertlin and with such resources as Gujarat, the above extent of irrigated land is vory short. Under a proper system of irrigation its produce would be unlimited in variety and asperior in quality and quantity. The value of irrigation is practically the difference between the production of the cereal staple and yield of the malyat or garden crops which give two to ten-fold more to the raysts capital thereon invested. The cultivation of these malyat crops, such as supercase, plantate, ginger, turmerie, and chillies depend very much on capital and the raysat's resources. Even with clear prospects of great profit, only the man with large capital is able to intempt it. Such cultivation is seldom possible for a single rayst, because ploughs, cattle, and labour are required to prepare the land and raise the water from wells. In such cases, three or four myats have to combine and norsk such a profitable underthing.

The scope of garden caltivation is large and deserved en-

The scope of garden calcivation is large and deserves encouragement

For purposes of irrigation it is not necessary that a tank should retain water during the whole year. It is enough if thin pool covers a large surface, and is so situated that the land to be irrigated lies around and slightly below it. In the event of a scanty rainfall, the cultivator has recovered to his tank in September and October, and by watering them saves his early or khorif crops. For the ordinary late or ravi crops, it is enungh if the supply of water lasts through November and December. So that, except in the case of supercase, if the reservoir contains a supply of water to the end of Docember, the cultivator is independent so far as his crops are concerned. Pouds of the above description are easily made and at a small cost. easily made and at a small cost.

## Question 5.

Loans under the Land Improvement Act are not freely taken by the people for the extension of irrigation. It is desirable that instalments he extended to forty or fifty years and not less than thirty years.

No interest lo be charged if the talari recipient agree to repay the loan by ten yearly instalments.

The rate of interest to be 2 per cent. If the taknri recipient agrees to repay by twenty yearly instalments.

The rate of interest aut to exceed 4 per cenl. if the takaci recipient agrees to repay the loan by thirty yearly instalmente.

If the water of the well becomes brackish or unfit for irrigation, or, if the well is damaged, or becomes otherwise unfit for irrigation purposes, the instalments due thereafter should be remitted.

I am unt in favour of the construction by Government of wells in land which is private property for obvious reasors.

## River Irrigation.

As most of its rivers flow along deep narrow channels with sandy beds, the province of Gujarat is not well suited for direct irrigation. This is especially so, as serious less of water-supply is caused in bringing canal water several miles from the rivers to command fields on a much lower

Mr. B. Kirparam. 4 1 cc. 01.

Mr. B. Kirparam. 4 Dec. 01. levol. At the same time, there are many spets along the course of several Gujant rivers, where, by means of a frame on perpendicular river banks, water is raised by bag B.

The chief difficulties in river irrigation seem to be (a) high banks in sems parts, (b) absence in the river-bed of a solid foundation for weirs, (c) want of suitable sites for storage reservoirs, (d) looseness of soil whereby the loss in soakage is so great, that, oven within a limited arco, water will only go about half as far as in heavy lands.

The Narbada is the largest river in Gajarat which posses through a pertion of the Breach district, most of it, and consequently tidal, unfit for irrigation.

The Surat district has cloven rivers, the Tapti, the Mindhola, the Purna, the Ambika, the Auranga, the Par, the Kolak, the Damanganga, the Kavori, the Kbarera, the Vauki and the Kim rivers.

The Tapti is the second Gujarat river with a coorse of 70 miles across the alluvial plain of Surat, of which about 12 miles are subject to tidal influence.

Though no lands are at present irrigated from the Tapti, projects with that object have been framed by Captain Chembers in 1859 with an estimate of Rs. 36,75,000, and by Colonel Trevor in 1867 with an estimate of Rs. 1,32,00,000, and a further scheme in 1871 on a smaller scale with an estimate of Rs. 41,00,000. Attention is requested to a summary of the projects given in Hombay Gazetteer, II, pages 15—18 (wide also Bombay Gevernment Solection, New Series, LXI.)

If protection from famine and not a remnuerative return on the outlay be intended, the Tapti is suited for irrigating parts of Maudyl and Olpad in the Surat district and Ankleshvar in the Breach district.

The remaining smaller streams rise in the high-land to the east of the Surat district, and flow west ward in many cases over rocky beds between banks wide apart formed sometimes of ulluvial cliffs, and at other places sloping goutly to the stream. 'Swellen into torrents in the rainy season, the freshes soon pass off, and in the dry weather only a seasty flow of water remains trickling among stones oud in places forming deep pools. About 10 miles from the coast, they are subject to the influence of the tide.

The Surat District has a large garden cultivated area which admits of extension, if proper facilities are given by irrigation. And it is necessary to investigate how far, by storage reservoirs or otherwise, the waters of these rivers might be used for irrigation purposes.

In the case of the Mahi river especially, its high rugged banks prevent its water being used for irrigation; and, so deep is its bed that, it drains rather than feeds the springs near its banks. In the Panch Mohnls on account of the broken ground along its banks, the water of the Mahi is seldom used for irrigation. .

The Sabarmati, the fourth river in Gnjarat, is largely used for irrigation during the fourteen miles of its course along the western limit of the Kaira district.

In the Ahmadebad district the failurs of the late raius injuriously affects its rice cultivation. If it can be arranged to give the surplus water of the Sabarmati, if any, to rice fields, valuable rice crop might be saved. This would also materially help the broken peasantry and improve their condition.

The Hathmati and the Khari rivers have already been used for irrigation by the Irrigation Branch of the Public Works Department (vide Bombay Gazetteer, Volume IV, pages 6-7.)

The Shedbi river in Kaira, after meeting the Mohar, has its water so charged with soda that being found hurtful to crops, its water counct be used for irrigation (Bombay Gazetteer, III .)

The Vatrak, flowing in Kaira between alluvial banks about 20 fest high, and with a shallow and failing stream, flows over a bed of sand about hundred and fifty feet broad. Its water is at present much used for irrigation by the help of lifts (Bombay Gazetteer, III.

The Khari passing through Kaira and falling into the Sabarmati waters many rice-fields by banks thrown neross. Formerly of earth, these embaukments here new been replaced by seventeen permanent masonry dams with sluice gates commanding an area of 11,000 acres in cloven villages (Boshbay Gazetteer, Volume III, page .)

#### Wells.

- 1. In Surat and Broach districts, permanent wells have an average depth of 30 feet. In Kaira, the depth varies from 25 feet to 46 feet, reaching to from 70 to 140 feet in the south cloug the Mahi. In Ahmadabad, the depth varies from 30 to 60 feet. In the Panch Mahals, as springs are found clese to the surface, wells are not sunk more than from 15 to 30 feet. Debad and Jhaled are better supplied with streams which hold water throughout the year, and are readily available for water-lift irrigation, as in many places their banks overhaug.
- 2. (a) In an ordinary year, the supply in the Panch Mahals is from springs, percential and sweet. In other districts the sopply is by percelation and percential. In parts of Ahmedahad, it has a tendency to become solt.
- (b) In a year of drought, the water level sinks low, especially in Kaira and Aumadabad. Coses of total failure are not known.
- (c) The average cost of constructing a one kos mosonry well about forty feet deep varies from Rs. 400 to Rs. 600. There are many old mosonry wells in the province of eight or 12 kos, especially in Kaira and Ahmadabad, which would now cost from Rs. 3,000 to Rs. 5,000 to build. An excavation of snitable diameter for one or more water bags being mode to a certain depth in the firm soil, until water appears, a circular frame, generally made of samda wood which has the virtue of bordening in water, is slipped to the bottom, upon which a brick-work called tundi is built up, while the digging work still continues. The superstructure sinks as far as it is possible to dig, in aid of which several lifts are kept that at work, drawing off the flowing water. In this way the tundi is ofton sunk 16 or 20 feet below the first oppearance of moisture. The brick-work intended to be under water, is carefully filled with mortar, coment being only used to finish the upper parts. If the spring should fail after a time, a second tundi of smaller diameter is let down on the same principle, and occasionelly a third, the cost averaging Rs. 100 for overy additional ten feet of digging.

Unbuilt or kackeka wells abound in all ports of Gnjarat. These are simply holes of from 10 to 25 feet deep, and about three in diameter, dug in the allowiol soil, without brick-work or masonry, costing each about Rs. 10 and lasting only for one year. When one falls in, a fresh hole is dug in some other part of the field. Built wells vary considerably in cost. An average masonry well from 30 to 40 feet deep costs about Rs. 400 to Rs. 600.

- (d) The average duration of a properly built well, if kept in repair from time to time is not less than a landred years.
- (c) All through the province the water is raised from wells by the ramio or sundhio leother bogs.
- (f) The average area attached to and commanded by a well is three to five acres.

## Well Irrigation.

The bhal or block soil country in West Ahmadabad, including half the Dhelko and the greet part of the Dhandhuka talukas, has, in ordinary years, a prolific crop of wheat and cotton. But the tract is liable to distress in a year of drought, end counct be protected by well irrigotion, as sweet water is searce, and the soil has a tendency to get solive.

The same remarks apply to the bara or coast tract of the Vagra, Jambusar, and Amod sub-divisions of the Breach district.

In Kairs, except in the north, near the high banks of the Mahl, weter is generally found at a moderate depth, and the sub-soil water is so good that wells are not inflected by ordinary short rainfall. Consequently all through this district, and most in the tract about Nadiod called *Charo*tor, well irrigotion is very general.

In Surat and Broach wells are generally perennial and are not known to fail even in years of drought. But well-irrigation in Broach is not so general as in Surat and Kaire.

All through the province of Gujorat well water is largely used for the proposes of sugarcane, tobacco, vegotables, condiments, spices, and other garden produce colled lagagat.

## Rice, Irrigated and Unirrigated.

Rice cultivation comprises Toth of the total cultivated area of the province, as being a crep adapted to the soil and climate, and also remanerative. The most productive rice-fields are in the Chikhli taluka of Surat, with 22 per

cent. of the total village area, and also in the Mater faluka of the Kaim and the Daskroi and Sanand talukas of the Abmedabed district.

The two chief varieties of rice arr (a) Akasia dangar, which is raised in wet land subject only to the direct rainfall, and (b) Pit dangar, raised by auxiliary irrigation from tanks, rivers, and takes.

As rice requires moisture, low-lying land near tanks or the lower termoes of elevated land into which there is ample draitage, are cought for ric entitutiou. Kali besar, which is an admixture of red and hladi, n calcareous clay, is the most productive soil. Next is the reddish clay of Pardi in Surat and Modara in Ahmadabad; but as a rule the gorat or red soils are not retentive enough. Much also depends upon the emlaukment. A properly embanked diasia pit at the base of a cultivated ridge is almost as productive as fields under tanks, except that the Pit dongar owes its superiority to the security against deficient rains and the ability of the rayat to raise the finer variety of kamed rire, which do not ripen before the 15th November, a full month after the commoner kinds raised in Alusia pit have been harvested. Abundance of water is found to be more essential to the crop than the quality of the soil, which latter admits of improvement by manuring. the soil, which latter admits of improvement by minuriog.

the coil, which latter admits of improvement by annuring.

Rice land is first prepared from waste or previous jarayet celtivation, by making a surrounding embankment to impound rain water, and level the bed at a cost of from Rs. 10 to Rs. 20 per acre according to height of embankment. This is followed by plongbing and cross-ploughing on the first fall of rain in June with manuring if it is intended to secure a good after-crop. Sowing is by (1) broad cast, by (2) drill, or by (3) transplantation. Ahuadance of water is necessary until the ear appears, after which mere externion suffices. Akasia rice crops frequently fail for want of a few timely showers in September; hence the great value in such cases of anxiliary water resources in the province, though the same may not absolutely be needed in most years for the common qualities of rice. All the fine qualities of rice which require moisture till September and which do not ripen until a fortulght or a month after the others can only be raised by irrigation.

Rice belongs to the kharif harvest in Gajarat except in

Rice belongs to the kharif harvest in Gajarat except in the hed of the Tapti in Mandri in Sarat, where a summer rice crop is raised. In the Breach District, rice is grown with cotton and other cereals without ony irrigation.

To secure his rice crop it io not unusual for a cultivator, who has no well, to hollow near the field, a small pond in which a supply of rain-water gathers, and if the latter mins fail, is carried into the rice beds by a channel or more often by a water lift, jhilu.

Sngreane is one of the most important garden crops. After the plenghing in June, the sowing begins in November with a harvest in December of from 45,000 to 83,000 cames per acre' from a sowing of 3,000 whole cames per acre or 2,000 pisces, cace containing from 5 to 7 cars. The field has to receive a flooding after November, and as soon as the shoots appear well above ground, compartments

are formed, and irrigation is applied in turn in every tea or fourteen days, so that the whole field receives about 24 waterings in the year. Land is incapable for the growth of sugarcane every year, and profits of cultivation depend on the results of four and sometimes of five years' rotation of less productive crops. While the cost of enlitration of an ocre of angarcane is almost constant, profits are very uncertain, and no steple varies so much in market value and the rayat cannot afferd to keep it in hand. The cost of producing eight thousand canes is about Rs. 187. The best cultivators of sugarcane are in the Amaika valley in the Surat District, where the land is alluvial, and not embanked for rice. In the case of embanked kali soil under a well, sugarcane comes in every fourth or fifth year and sice cultivation only ceases in the harvest year of the sugarcane called rasida.

Ghau or wheat is both irricated and unirrigated. It is grown throughout the province in all black and desar soils, but its cultivation most specially belongs to the barz or coast tracts and the bhal or plain country of Dholka and Dhandhaka. It requires good land, not the rich learny soil of cotton and jurar as it is too loose in texture for the wheat cruy, which entirely depends on the retention of moistone in the soil. If Irrigated it has to be always manured. The irrigated or Iddium wheat are of computatively less market value, which shows that irrigation is not congonial to wheat.

Harley or ign is receptlic an after-oran in garden vice.

Barley or jav is generally an after-oran in garden rice lands or in soils too sandy and open for wheat. It is always irrigated and measured. The tillage and irrigation being the same as in the case of Sanka wheat. It is a favourite crop in the gerat tracts of Ahmadabad and of Kaim.

Tobarco, when irrigated, is called pit or watered. A watered pit yields twice as large a crop as a dry crop. At the same time, the lraf of the irrigated plant is coarser and not more than one-half as valuable. Light or geradu land is the soil brst suited for the growth of the irrigated crop. The Kalva tobacco wante from five to twelve waterings, according as the well is perfectly sweet or more or less brackish. less brackish.

less brackish.

Of the condiments and spices ginger, grown in geradu or garden land, requires itrigation. Soil of the garden besar type is proferable to the kali besar, rain on undrainrd fields being not unfavourable as teading to ret the roots. The field receives about twelve waterings before it is ready to be dug up in November.

In the case of chillies or marcha, a small quantity of water is required for the first month. After this, the plants are irrigated after twelve days on failure of rain, and the chillies gathered as they ripen, which they cootione to do till March. The chillies raised in wet land without irrigation in the Limbdi villages of the Panch Mahals attent far greater perfection than the same variety watered elsewhere. The condimont aime is sown by hands in bels In October, which are irrigated once a fortuight. Methi, grown in gurden lands, is irrigated fortnightly.

- 1. Q. (The President.)—You are Talukdari Settle-ment Officer of Gujarat !—Yes.
- 2 Q. How long have you held that office?-For five Feate.
- 3. Q. The whole of Gujarat is under you?-Yes, except Sarat.
- 4. Q. You have been good enough to write a very full remorands in containing a great deal of information about soil and about irrigation. Were you also here during funiae?—Yes.
- 3. Q. I suppose you were working in the proviore?-
- 6. Q. Was there a great deal of distress?-Yes.
- 6. Q. Was there a great deal of distress f—Yes.

  7. Q. With your experience and knowledge what do you if ink is the right thing for Government to do in order to protect Gujarat from the ravages of such asfaminous the last i—The enditions of the different talukas and districts tary so much that one system will not suit all; for some talukas utils are the lest, for others storage. It is very necessary to consider the peculiarities of each taluka and district. As we can see by a reference to the map of the Ahmalaba'l district, there is in Dhandhuka Taluka a tract called the B'all where rice irrigation is not possible but where the natural nivantages are so great that I to I induces of rain are sufficient to raise a humper crop of wheat.

This area supplies most of the Gnjarat Districts and Kathia-war with wheat. This part cannot be protected even at the expenditure of any amount of money, because it is not fit for rice irrigation.

- 8. Q. Two inches of rain are sufficient?-Yes; for wheat.
- 9. Q. It will not grow rice?—No. This part suffered the most during the famine. The people were removed with their cattle to those parts where there were facilities for obtaining water,
  - 10. Q. Were they willing to go ?-Yes.
- 11. Q. Did they make irrigation works and use them?—, Yes; they came with their cattle and children, constructed works and irrigated their crops, using the water of the Salarmati river.
- 12. Q. This water is not taken in ordinary years?—No. This mater is not ordinarily used by cultivators.
  - 13. Q. What land did they irrigate?-Wasto land.
- 14. Q. (Mr. Bajaratna Mdlr.)—Government waste hand !- Yes, Government and Talukdani; it is not irrigated in ordinary years.
- 15. Q. (The Precident.)—They did pretty well through the famine P—Yes. In time of acute famine we seat these people from one place to another wherever these were water facilities.

Mr. 11. Kirpmara

4 Dec. 01.

Mr. B. Kirparam. 4 Dec. 01.

- 16. Q. How far did you take them ?-Thirty-five miles.
- Q. (Mr. Rajaratna Mdlr.)—Did the people of this part carry on irrigation?—Yes, during the famius. At other times, the water facilities being good, fodder and other crops are raised in the river side villages.
- 17. Q. (The President.)—Even in famius times?—Yes, with takavi advances.
- 18. Q. In the taluka of Dhandhuka was there any great distress during the famine?—Yes. People had to go to other places; now they have come hack and there were three or four inches of rain last year, and thay grew first class wheat and cotton, but unfortunately these crops were destroyed by rats.
- 19. Q. (Mr. Rajaratna Mdlr.)—Rats and locasts appeared after the famine?—Yes; the peculiarity of Chuval in the Virangam Taluka is that its brackish water is suited to barley and wheat. Practically harley is an irrigated crop and thrives well on brackish water.
- 20. Q. (The President.)—Is it intensely brackish?—We cannot drink it, but it is very good for cultivation; there are a good many big wells; they are of 8 kes; 6 kes and 5 kes.
- 21. Q. (Mr. Higham.)—Where do the people get drinking water from ?—From ponds and tanks, not from wells. They have get big wells, which cost one thousand to two thousand rapecs to haild.
  - 22. Q. The water is fertilising ?-Yes.
  - 23. Q. What do they grow f-Barley and juari.
- 24. Q. I suppose rice is grown?—Yes, in some parts. There are some crops which do not require sweet water. For instance, irrigated rice is sold cheaper than unirrigated rice.
- 25. Q. What, in your opinion, is the best thing to do for this district in order to proteot it against the ravages of another famine?—There are some tracts where well irrigation should be encouraged; then there are other tracts where nallah or river water might be stored and used in times of famine.
- 26. Q. As regards the storing of river and nallah water, you say there are some sites for this; do you say this of your personal knowledge?—Yes, I say it from my personal knowledge. There are a good many places where it is possible to store water from nallahs and rivers.
- 27. Q. On a large scale?—Yes, I think, on a sufficiently large scale.
- 28. Q. Large enough to provide storage for 400 or 500 acres ?—Yes, certainly.
- 29. Q. Do you think there are sites for storage reservoirs bigger than that?—Yes; but no recial inquiry has been made as regards irrigation facilities in Gujarat, because Gujarat has been immune from famine for nearly a century. Nobody has thought the subject out.
- 30. Q. You would make the irrigation of Gujarat the subject of careful study?—Yes; first begin with wall irrigation, and secondly utilize river water for irrigation. My opinion is that there are some places where it is possible to make reservoirs and collect water; a special Engineer should make surveys.
- 31. Q. I think surveys are heing made?—Yes. As for well irrigation, I am sure that it should be encouraged.
- 32. Q. How do you propose to encourage it?—The raies of Government are already very liberal. The Assistant Collector has power to give up to Rs. 1,500, and the Collector can give up to Rs. 2,500, so that if a man wants to build a well, he can take an advance from the Collector and build it; a well should not be subject to enhanced assessment.
- 33. Q. Is there anything further which has not already been done that might be done to encourage the construction of wells?—No; the rules are very liberal.
- 34. Q. (Mr. Muir-Mackonzie.)—Could the liberality be increased?—Not I think if proper care is taken to work the rules; they are very liboral, the officials have got ample powers. Under the rules, instalments can be suspended. No strict inquiry should be made and no extra assessment charged.
- 35. Q. You have hoard that the last witness said that if a man applies for advance, it would be five or aix months before he got his measy; that is too long?—Yes, that is the fault of the individual officers.
- 86. Q. Not the fault of the rules?—No; the rules are very clear and complete; they are very liberal. If any-

- thing, it is the fault of the officers; in many places Government directed the Mamlatders and Assistant Collectors to visit villages and pay the money on the spot.
- 37. Q. Do you think the rate of interest charged is any obstacls?—I would be inclined to reduce it. Even the present rate of 5 per cent. is rather hard for the oultivator to pay; if he takes Rs 1,000, he has to pay Rs. 50 s year, and that is too much. I propose that the rate of interest should be reduced to 2 per cent, and the number of instalments incressed to 20. If a mun is in a good position he would not like to be indebted to Government for longer than he can help.
- 38. Q. Why not be liberal and take no interest at all?

  —That would he a good thing.
- -39. Q. If we say "if you agree to pay this money back in ten years, you have it free of interest," would that have some effect?—I think it would have a good effect. The only question if you chargo even a small interest is whether it should be charged or not when the water in the well hecomes brackish or unsuitable for drinking purposes; and whether the instalments due in respect thereof should be collected or not. According to the existing rules Collectors have power to remit up to Rs. 100; but total remissions cannot ho made as far as I know.
- 40. Q. (Mr. Muir-Mackenzie.)—They can be made by Government?—Yes.
- 41. Q. (The President.)—One or two witnesses have said that the reduction of interest would eacourage the people to start making wells without proper consideration?—No, on the contrary my experience is that these who want to make wells are very skilful people. They are generally well-to-do and skilled cultivators.
- 42. Q. (Mr. Higham.)—Do you recommend wells in preference to canals?—Yes; canals on this eide do not give sufficient water.
- 43. Q. If they have sufficient water, then they are alright?—Yes, then they are better than wells; the Engineers must decide whether the water will be sufficient. The proposed Saharmati canal will save the rice crops if the Engineers see that there is sufficient water. My only miggivings are that the water will not be sufficient.
- 44. Q. (Mr. Ibbetson.)—What interest does the cultivator pay to the bania?—I think it varies from 9 per cent. to 16 per cent.
- 45. Q. But he can get money from Government at 5 per cent.?—Yes.
- 46. Q. Would be refuse to take at 5 per cent, and go to the bania and pay 9 per cent, to 15 per cent, ?—Yes, to save time and inconveciences.
- 47. Q. Do you think that the rate of interest prevents a man from making a well?—Not always. My idea is that well irrigation should be eucouraged and that therefore you should give money at a reduced rate of interest. In ordinary times 5 per osut, is a very low rats.
- 48. Q. Do you think that 5 per cent. provents a man from making a well any more than if he got the money fres of interest?—Yes; in cases where the cost is very great. In some places a well costs Rs. 1,000, but it might cost Rs. 700, Rs. 400 or Rs. 300. It varies according to the dapth. Where a well can he constructed for Rs. 200 or Rs. 300, the rata of interest is not vory material, but where a well costs Rs. 1,000 it is material. As a rule the bania does not loud money for well-sinking.
- 49. Q. Why not?—He will not; no village bania will lend a thousand ruptes to a cultivator.
- 50. Q. (Mr. Muir-Mackenzie.)—He will lend money for marriage expenses ?—Yes, but ordinarily he will not give more than Rs. 200. In the Viramgam and Dholka Talukas the cultivators who are prosperous can get from Rs. 1,000 to Rs. 2,000 for the marriages of their sons or danghters; but an ordinary cultivator, a kunbi or a koli or a dharula cannot got more than Rs. 200 from the village bania who is very careful about Isnding money.
- 51. Q. (Mr. Ibbetson.)—Have you got many wells in Gujafat !—Yes.
- 52. Q When do you think they were made?—Many were made before the original settlement.
- 58. Q. What did they cost then; do you know?—They cost less than they do now; oultivators worked among themselves; now they don't help each other.
- 54. Q. All the money that was wanted to make wells was horrowed from the banias?—blany had their own money.

Mr. B.

4 Dec. 01.

- 55. Q. Most of them had?—Yo; they constructed the wells hit by hit; they began with the initial work, then they did the work on the mst aide, and then they completed the work. Ordinarily it took two or three years to complete a well.
- 50. Q. How soon do you recover the first instalment of takari for wells.—The present practice is to recover after the well is constructed.
- 57. Q. Do you wait till then? Yes; the rules are very elear.
- 58. Q. Would you like to see Government charge only 31 per cent. interest?—Yes.
- 59. Q. Do you think that they would rather pay 5 per cent, than have a small charge assessed on the area trrigated?—Yes.
- (2). Q. (Mr. Rajaratna Millr.)—You say that the rules regarding taken are very liberal?—Yes; but the difficulty is in practi ally working them.
- cl. Q. How would you get over that difficulty?—That depends on the officer; a lary and Indolent officer may take six months, while an intelligent other would give the mency on the spot.
- 62. Q. Hon do you needs your akashia lands; are they assessed at a higher rate than jarayat land?—Yes.
- 63. Q. In your meuo, you say, "the scope of garden cultivation is large and deserves encouragement." In what way can encouragement be given?—These people may be encouraged to take takari and extend cultivation largely. There should be a little exertion on the part of the others to explain to the cultivators what the orders of Government are mid how far Government is willing to help them.
- 63. Replying to question 39, you say, "there are many spots along the conrect of several Gujardt rivers where, by means of a frame on perpendicular river panks, water 1 raised by bags "P—A good many places.
- CJ. Q. Is it possible to increase the number of such lifts:—It is not possible; where there are facilities, of course, people take water; if it could be arranged to give them flow irrigation, then it would be a good thing.
- 66. Q. In many cases it is not persible to give flow irrigation?—Yes; where there is irrigation they take water from the river; two men are employed to draw water, that is one style; then a good many people draw water by lifts; and it flow irrigation was given to them, it would be a good thing.
- 67. Q. (The President.)—Have you any experience of the use of steam pump-t-I saw a good many at work during the famine time.
- 63. Q. Do you think they are too expensive?—Yes; and then there are very few places where one can put up pump- and take mater.
- 62. Q. In Egypt you see hundreds and hundreds of them -I think steam engines will not do; the fuel costs ton much.
- 70. Q. In the case of lifts In the Gujarat rivers, is a water-rate charged for irrigation?—No.
- 71. Q. (Mr. Muir-Mackenzie)—What do you think of the proposal that Government should pay the whole cost of the well and take a moderate assessment on the land irricated by it?—An intelligent enhanter or a private individual might like the idex; but the ordinary englitator would not understand it; he would get nerrous lest the assessment should be enhanced.
- 72. Q. Suppose a well casts. Re. 500 and that Government should give the cultivator Re. 500, and where the cultivator formarly paid Re. 5 px acro. Government should say, "t e will not recover the Re. 500, but you will now pay Re. 10 on each acre irrigated instead of Re. 5 "1—That would he a very good thing.
- 73. Q. Wenld be be willing to gay the a littlemal assessment in the well for every—Yes; but the well must be constructed by the cubicators themselves and not by Governments. ernment, as that Government will not be sminded out of their own names and will not have to pur its 500 where the netlential bedone for its 300. Py proprinspection and powered in including the content that the while efect to far him
- 74. Q. Boyer strains many for wells in the critics under your own management, I mean talablaries at a Yes, his not in famine times, because, I think, it would

- not be possible to complete a well within a certain time; sinking a well in famine times is practically necless. Kiryaram.
- 75. Q. Do you give money out of the talnkdari estates?—Xes; for kachcha wells; a pukkn well cannot be completed in time.
- 76. Q. But they would give employment !-Yes; but I would not give large advances in times of some famine.
- 77. Q. Do you, in the estates under your management, give money for wells in ordinary years?—Yes, but generally the falus dars themselves build wells because they are the proprietore.
  - 78. Q. That Is like Government building a well f-Yes.
- 79. Q. If talukdars can provide wells on the lands of their tenants, why cannot Government hulld wells on the lands of their rayats?—The talukdars have tenants on their own terms who can be turned out at any time; ereas the rayals cannot be turned out.
- 80, Q. You know the Broach and Surat districts?-
- 81. Q. Do you think that the drains do any good?—Yes; but in some parts they have done harm. Of course they do good; but the danger of drains is that we don't know whicher other lands will be spoiled or not. They have to be carefully watched.
- 83. Q. (Mr. Ibbelson.)—During the rains?—Yes, water-logging and in some places scouring occurs. I have heard complaints that good land gets secured.
- 53. Q. (Mr. Muir Mackenzie.) Did you see anything of this during the last year;—Yes, in one place in the Virangam Taluka. I am not prepared to say whother it was due to the drains or to heavy rain. We are not in a position to give a decided epulon just new.
- 84. Q. Do you think that the drains earried off useful water this year?—This year there was no proper opportunity to test the subject.
- 85. Q Drains are ordinarily wanted to earry off water from mater-logged areas; this year the areas were not water-logged?—No.
- 80. Q. Did the drains carry off water which would have been available in this year of drought ?—I don't know; there was no apportunity
- to observe.

  57. Q. You think that the most useful kind of famine relief nork in the greater part of Gujerát would be the construction and repairing of tanks?—Yes, smell tanks for irrigation.
- 83. Q. Not water-supply tonks so much as irrigation tanks?—Water-supply maks are made ordinarily by the Local Boards. In times of fomme local land tanks and village tanks carry no distriction. They are all made by Government in times of famine. It would be much better to dig irrigation tanks than other tanks in times of fomme.
- 59. Q. You would give preference to strigation tanks in times of famine?--I would.
- 10. Q. Don't you think that tandhe or long bunda would form useful famine relief works !- Yes, tunde don't
- 01. Q. So much the better?-In some places they may do good.
- 92. Q. (The President.)—Are you opposed to largo inks?—Yes; unless they can be made to give water in tanks ? famioe time.
- 03. Q. You consider that small tanks are more metal. Was there more water in small tanks than in large during the famine?—Yes; small tanks are useful for irrigation purposes; there are some tanks which are not useful for irrigation purposes; In ordinary years there would be no irrigation from them.
- 91. Q. Not even rice f-Yes, rice cultivation is impossible without a large supply of tank water when late mins fell and other crops don't want water. If you want large lonks, the existing irrigation tanks might be enlarged.
- P5. Q. (Mr. Mair-Mackenzie.)—You would enlarge the existing tanks?—Yes.
- 96- Q. (The President.)—I do not fully understand what you say about the irregation tanks?—The new tank made during the lamine that I have seen ate of no use in ordinary times for irrigation.
- 97. Q. (Mr. Muir-Mackennie.)—Because the localities in which they are situated are unsuitable for irrigation

Mr. B. Kirparam. 4 Dec. 01. purposes?—Yes, but there are existing irrigation tanks which may be improved and extended and made larger and would be able to irrigate a large area of rice.

98. Q. (Mr. Ibbetson.)-You would not have Govern-

ment make wells in private heldings?-No; Government should not undertake the building of wells.

99. Q. You do not think that would be a good plan?—No; there are many objections to it.

H. Dhiraj-

4 Dec. 01.

WITNESS No. 17.—RAO BAHADUE HIMATLAL DHIRAJBAM, A. M. J. C. E., President, Ahmadobad Municipality.

Answers to printed questions.

The following replies refer particularly to the Alumadabad District, with which I was connected for ubout ton years. I was a member of the Public Works Department for about 35 years, have served in all the districts of the Northern Division in various enpanties, and was Executive Engineer of the Alumadabad District for about four years.

Irrigation in the Ahmedabad District may be classed under the following heads:-

- (1) Wells
- (2) Water-lifts, called Dhekndis, from rirers, nallahs, streams and other sources.
- (3) Tauks, including bunds, in the Sanand, Viramgam and Dholka Talukas.
- (4) Canals.

There are in all 13 to 14 thousand wells and Dhekadis in the Ahmadabad District, which irrigate about 50,000 acres. About 25,000 acres are commanded by taaks; and the present causls may be roughly assumed to have a capacity of irrigating about 20,000 acres. Thus wells, tauks and canals command in all about a hundred thousand acres; or about 5 per cent. of the total calturable area of the District may be said to be protected by the existing irrigation facilities. Except a few, all the wells, and a few of the tanks and bunds, are prirate property. All the canals belong to Government, who control the distribution of water from them ander cortoin fixed rules, and charge irrigation, revenue at fixed rates per acro irrigated, varying according to the crop; but this rule is not applicable to lands on the Khari sluices, which were assessed at the time of the survey cettlement upon a consideration of the water adventages they obtain from the river. Remissions of the waterate are given when the crops watered from the Hathurnti and Khari Cut canals anter from an insufficient supply. There is ordinarily a demand for water during the sauthwest monsoon; and it occasionally happens that, for want of one or two waterings in September and October, the rice crop suffers considerably. The distribution of water from the tanks is made by the cultivators themselves mader the general supervision of the rorenue authorities. The water-rate for tanks is assimilated with the land revenue, and collected by the rillage officials in lump without reference to the plots irrigated. The soil is, for the most part, sandy, with the exception of large patches of black ceil in the Dhelka, Dhandluka and Virmugam subdivisioes.

The number of weterings required for the several crops vary according to the amount and season of the rainfall, as also according to the nature of the soil. If the minfall is deficient, rice requires, between July and October, 5 or 6 waterings after transplantation; wheat 7 to 8 waterings from Norember to February; and Jowari (as u hot weather or Hari crop) about 6 to 8 waterings from March to May. Sagarcane requires a very large quantity of water, umounting to as many as from 25 to 30 waterings during the year.

Small tanks constructed in black soil, which is light in this District, rotain water; and carthen dams, not exceeding 12 to 14 feet in beight, oon be safely constructed without masoary cers walls. As a rule, whether the soil be red or black, there is always a demand for water in the south-west monsoon for the rice crop; and I um of opinion that in projecting new or repairing old tanks, the nature of the soil, whother black or red, need not be a matter descriving any special consideration in this district. The cultivators ore already beginning to appreciate the adrantages of irrigation; and, as Executive Engineer, Pablic Works Department, I came across a number of instances in which they expressed their willingness, by all means in their power, to help irrigation schemes.

The only existing Government irrigation works in this District are the-

Hatbmati Canal, Khari Slaices,

and

Khari Cut Caual.

These, however, cannot be much depended an during reasons of drenglit. Proposals for increasing the sapply in the Khari from the Bokh near Parantij are under consideration for several years; and if they are carried out, a large portion of the Daskrei Taluka in Ahmadabad and of Matar in Kaira will be greatly beachted. There is any amount of culturable lond available in this District, but not now under tillage, and the caltivators are skilled and industrious. House all water facilities that could be provided are likely to be utilized to the greatest advantage. I am not in favour of the Sabarmati Canal, as, owing to the sandy untire of the seil, there is likelihood of a considerable waste by absorption; and I do not think the project could be made financially remanerative.

In my opinion, more satisfactory results could be secured from caucis of small lengths from the Meshva and other rivers. Some dialonge channels, combined with irrigation facilities, are required within a few miles of Abmadabad, as, in years of anaple manfall, crops suffer from excessive, and, in years of senaty minfoli, from deficient, water-supply.

In parts of Dhandhuka, Dhelka and Viromgam, similar works are also mach needed; and if they are properly projected after due enquiries, the district will be greatly benefited. Such works, affecting only one or two Talukas, might be carried out with advantage from Provinciol revenues. At present no irrigation works are constructed or maintained from other than Imperial Funds.

No now irrigation tanks or bands have been receutly constructed. All the existing works ure of a very old date; and by G. R. No. 125 W. T., dated 15th September 1892, Government have already ocknowledged their responsibility to keep them in proper repair. Small sums are being spent from time to time for their maintenance, but in only a few instances, have therough repoirs been unde. It is, therefore, difficult to estimate, with any degree of accuracy, the cost of repairs per acro irrigated. The total number of tanks is about 1,200, and the area dependent on them about 25,000 acros. The protective value of these works will be greatly enhanced by restoring them to their original condition, as soon as practicable. I would also construct new bunds where natural facilities exist, so as to increase the irrigable aron as anuch as possible. I do not think such works can be undertaken on any large scale by private agency. Besides, the matter is one of Provincial interest; and I do not think Local Fands should assist, to any material extent, in the improvement of other than rillage tanks used by rillogers and cattle for washing and driuhing purposes.

## Wells.

The total namber of wells in the district is 13 or 14 thousand, which, in years of drought, irrigate about 50,000 cores. In my npinion, the construction of wells should be stimulated by all possible means, and as they afford a really effectual protection from drought and famine, sufficient inducement by liberal advances raight be given for their construction in large numbers. The people are fally alive to the protective value of wells from time immemorial. Thus, there is errory hope of their coming forward to construct them, provided special oncouragement and assistance on the chove lines are given by Government.

The average depth of wells in the Ahmadabad District may be put down at from 30 to 50 feet, and the average cost of a well about Rs. 600 or 700. A well, on an average, irrigates from B to 5 oeres, and if kept in proper repair from time to time, it may be expected to last over a hundred years. In most cases, the supply is from percolation which is liable to fail in years of drought. Some of the welt are percaniul. In some parts of the district, viz., partions of Dhandhula and Dholka, sweet woter is scarce and the soil has u tendency to become salt.

All throughout the district, well water is largely used for the purposes of sugarcane, tobacco, vegetables, etc. It is usually raised by meens of two kinds of mots called

"Sundhia" ur "Ramia" Kos. In a year of sufficient rainfall, irrigation does unt make any great difference in yield; but it enables two larvests to be obtained, and ulso year, one is changed the inverse to be continued, and used the growing of valuable crops. In years of scanty rainfall, however, it is of great value in earing crops. The annual net value of the produce per sere is about the same in years of number rainfall as in years of searty rainfall, with irriga-tion,—the cost of cultivation being more in the latter

No special difficulties are encountered in most pasts of this Instrict in the schedum of a spot far wells; but in parts where the soil is saline, it is difficult to estimate whether water would be found sweet are otherwise; and, for this purpose, the selection of the spot is under after examination of the depth of neighbouring wells. Illinduviters have land down certain rales in repart to the selection of suitable sites for wells. According to them, water is unit with at a reasonable depth below a site where rayan, Minuscops indics; tierra, Dierpyros montone; Sando, Eriod-andro untractuasum; jamlude, Syryganum Jambolianum, and Kerdo tries grow. The growth of Haridi graes on any spot in the dry weather is also a snio sign of water being fuand there not far from the surface. Sometimes, in places, a stratam of quickend is met with In sinking wells, and the increases the difficulties of sinking. I think the Government would do well to supply the use of boring tools in cultivators with expert advice for their use. A few trial borings mey also be undertaken by Government in different tracts to ascertain the quality of the water, as well us the depth ut which it is obtainable. I am against Government undertaking the construction of wells. As a rule, I am not in favour of Government undertaking wurks, the value of which they are personally interested. Huwever, it would be more satisfactory if a supervising slaff is maintained by Government to ee that such work is praperly done.

Grants-in-aid may be given for the construction of wells on emitable terms; and this, in my opinion, ought to No special difficulties are encountered in most parts of

Grante-in-aid may be given for the construction of wells on enitable terms; and this, in my opinion, ought to induce people to sink a very large number of wells.

Properly constructed wells alone are generally used for irrigation. Tempurary wells are not so largely used, and do not afford much protection against droughts. I think it would be better to provide for a sufficient number of pakka wells in normal years, so that the same may be available in years of scanty rainfall or drought. In my opinion, a year of scarcity is about the most unfavourable time for sinking wells; as the people, at each times, being much in want, are charry in spending, being not hopeful as to the result.

To become ahis rice crop, it is usual, fur n cultivator who has no well, to make n small hollow in a convenient part of his field where rain water gathers; and this is carried into the rich heds by u water-lift, Jhilu, when the later

rains fail.

There are already about 13 or 14 thou-and wells in the District irrigating about 50,000 acres; and every additional well is a lilewing, as being of great princetive value in times of famine. In fact, I consider wells to be the most reliable source of supply in years of drought.

In Virangam and Klaragheda, berings were taken at different times to a depth of about 150 feet; but the result was not estisfactory. However, in my opinion, further experiments are desirable, and should be carried out in all parts where difficulties are experienced in obtaining a sufficient and wholesome supply of water.

Drainage.

A few drainage works have already been carried out in paths of Virangeon and Serand, but much still remains to be done in this direction, act only in the Virangeon and Sevand. Taluhas, but also in Duella and Dhandhula. Large tracts of land in the district remain uncultivated ewing to their waver-logical condition; and it is to the interest of all concerned to have all such places thoroughly transical, and preparates taken in make them suitable for regionizeral purposes. In constructing drains, provided all such and analysis and inighting the supply in ordinary years for clining he tanks and inighting the supply in ordinary years for clining he tanks and inighting fields. The above-reached drainage works are also necessary to improve the calarial condition of the surroundings, due to stagmatim of water. Funds for this purpose should be provided fact: frostrein's receives, especially as such works are allfiely to readly in an inverse of revenue by reacting relinquished that and by inducing cultivators to take up fields already given up

Tanks.

H. Dhiraj-4 Drc. 01.

Tanks are supplied with water from their own catchment areas. Some of these have, of late in some caves, been taken up for calification. Water from such tanks is distributed by the cultivators themselves. In some of the larger tanks, pipe outlets have been provided. In sure, water is drawn by lifes. The supply is not made perennial by any special means, and the required quantity of water is drawn from the tank so long as it is ubtainable. It is difficult to say what amount of rainfall is enficient to fill tanks. In 1900-1901, with a fall of about 10 inches, some of the tanks were only partially filled; while, thus year, with a rainfall of ubout 10 inches, the tanks are practically dry. There are very few tanks in this district from which two crops are entitivated. Rice crops are grown on land commanded by tanks, and the increase in the value of the produce of land in such cases may be put down at about 10 to 60 per cent. People do not use much tank water fur irrigation in good years. In years of reinty rainfall, their uses is to the extent available; while, in years of drought, owing to insufficient supply, un crops thrive satisfactorily. Tanks are supplied with water from their own catchment

How far a teo late commencement, ur a too early cession, of the supply affects the value of irrigation depends upon the timely transplantation of the socilings, etc. If the commencement of the mension is late, the lajti error would fail, but the rice crop would thirt; and, in case it is late for both erops, Rabi would be put in. A too early cossation of the mansoon would affect rice, as well as liabicrops; and artificial irrigation, in these cases, would greatly help them.

The cultivators generally saw certain kinds of crops when it rains during certain constellations or Nalshatras, and me under the impression that, when this is done, the crops thrive. When sown at other times, they are believed in fail through some reason or other. How far their ephilom about the matter talkes with the netual facts is a question that needs verification in the light of neutral experience. In years of seanty rainfall, folds with wells, or commanded by tanks, arigate respectively from the wells or tanks. The number of waterings vary from 2 to done, the crops would seriously suffer. Irrigation may be said to give approximately an increase of about 40 to 50 per cent. In the total annual value of the rainfall; and if this is not done, the crops would seriously suffer. Irrigation may be said to give approximately an increase of about 40 to 50 per cent. In the total annual value of the produce per nere. In years of drought the crops fail, as the tanks, etc., on which irrigation depends give little of no supply in each years. All petty expenditure, necessary to bring the water to the field, is incurred by the teanth, who expects nu recomposent; but, when the expenditure is heavy, it forms the subject of a specific agreement between the tonant and the landlord. The tanks are generally repaired by Government. It is difficult to give the annual cost of repairs per acre, as such cost is comparatively more in semall tanks irrigating only a few acres, and less in large lunks having extensivu sreas dependent un them. In a majority of cases, tanks would require silt clearances once in 20 or 25 years; and the average nunual cost may be roughly put down at about une-third of the water revenue derived from them. There are very few, if any, private tunks; and I du not consider it desirable to encourage the construction of such tanks. No special measures seem to have been hitherto adopted for the purpose of preserving the uniginal depth of tanks. There is no distant or show what changes have occurred in their body, e The cultivators generally saw certain kinds of crors

Next to wells, tanks are useful in affording protection from famine, and it is very desirable that they should be maintained in a thorough state of efficiency. There are about 1,200 tanks in the district having about 25,000 neres of land dependent on them. If tanks are kept in proper repair, as directed in Guvernment Resolution No. 125/1473, dated 15th S. ptember 1692, above referred to, irrigation will be greatly benefited. In a majority of cases, water is drawn from tanks for rice crops; and as the late raise generally fail, two or three waterings are required to bring the erejs to maturity. The preservation of tanks in proper repair would also, to some extent, us-ist in securing a good supply of water in the neighbouring wells.

A water-rate on lands dependent on tanks was fixed at the time of the Entrey Fettlement, and it is collected on the whole area assessed, whilout reference to the area actually infigated.

H. Dhiraj-

#### Canals of continuous flow.

No canals of contionous flow exist in this district with the exception of the Khari, the assessment of lands depending on which is included in survey settlement rates. Increase in the value of produce varies according to the natore of the soil, the supply of water available, and the mode of preparing and cultivating the field; and, in years of normel rainfall, this may he roughly put down at about 1½ times. In some cases, two crops are put in, the first of rice and the second of gram or wheat in cold weather, or of Jowari in the hot weather. In years of scanty fainfall, there is hardly any increase, while, in a year of drought, it would depend mostly on its intensity. In years of scanty rainfall and drought, the crops are more liable to be attacked by rats, whiteants, Khapri, as also by a number of diseases; and this fact deserves to be taken into consideration in forming an estimate of the average return from the laud. In this district there are no private canals. Government is the sole proprietor, and charges depend on the area irrigated, except in the Khari Sluico District.

All expeases of a petty natoro are, as a rule, borne by the teaant; bot, when heavy expenditure is desirable or necessary, it forms a matter of special agreement between the landlord and the tenant. In places where water is allowed to stagaato for a considerable length of time, salt efflorescence is formed. Too frequent irrigation produces this salt efflorescence called "khar." With irrigation facilities, a lorge area of dry crop land could be converted into rice land, which is a decided advantage. Rice fields are protected by high banks, and only very low-lying and badly-drained fields become saltish. Therefore, if the cultivatora are offered sufficient inducements to take interest in their holdings, they would themselves do all that may be found recessary to prevent the damage caused by saline efflorescence, etc. Irrigation is being made in the Khari Sinice District for a very loog time. Before the construction of the present sluices, earthen dams were thrown across the river from time to time. Salt land may be roughly put down at 1st in the Khari Sluice District; shout 1st in the Khari Cut Canal (which was made in 1880); and nheat 1st in the Hatmoati Canal which is about 25 years old. These figures are only approximate. It is generally believed that only laods which do not completely dry up, become saltish.

## Canals of intermittent flow.

In the case of the Hathmati Canal in the Frantij Talnka, a wair, about 1,000 fest long and 22 feet high, is built across the Hathmati river near Ahmadangar in the Idar State, and water is turned into the canal as required from time to time. At the site of the Canal Head Works, the weir hos a drainage area of 520 square miles. The Hathmati Canal, 20 miles long, is completely bridged and regulated. Its first three miles pass through the Idar State. The discharge diminishes considerably as it reaches the tail of the canal

In the case of the Khari Cut Canal, a weir is huilt across the Khari river near Ranpur about ten miles north-west of Ahmadabad; and water is thraced into the canal, and brought as required from time to time, by means of regulating works which are duly provided. Water is distributed to fields by means of hranch and field channels and sinice gates. Water is assully required from 3½ to 4 months, i.e., from July to October. In years of scanty rainfall or distributed the fields require more watering, and it is with difficulty that some fields get even one crop, as the supply of water foils. Canals of intermittent supply give one crop when they run full during the Kharif, and two oreps, when they run full during hoth Kharif and Rahi seasons; and it is only in years of ample rainfall that it is pessible to secure two crops for some fields,—those inconveniently situated giving only one.

The ohicf Storage Reservoir is the Chandola Tank within four miles of Ahmodabad, from which water is distributed to fields as required. The Chandola Tank is fed from the following two sources:—

- (1) From its own catchment area.
- (2) From the surplus water of the Khari, which is allowed to run through the Khari Cut, after satisfying the wants of the Kallambandi villages, which have a prior right to the use of the Khari water. The supply has, of late, been increased by the surplus water from the Hethmati Canal, which is brought down to the Khori through the Bhojva Nallah branching off at the 5th mile.

The value of irrigation is considerably affected by the too late commencement or too early cessation of the min-

fall in case it fails in September and October, when water is much needed for the moturity of the crops. Nowhere in the district is coltitation solely dependent on artificial irrigation, which, in all cases, is only anxilisry to and in aid of the natural rainfall, and ascful for the production of the more valuable crops. So long as water is available from a causal or tank, wells are not used: hut when the supply from an irrigation work runs short, well water is ansed when required for the matarity of the crops. When need when required for the matarity of the crops. When the rains are late, well water is used for seedlings. The value of crops raised in any one year can he only comparatively calculated, as it depends on the market rate whose fluotuations depend upon a varisty of causes. In a normal year, an irrigation field may he expected to yield about 40 to 60 per cent. more than ac unirrigated field. Though there have now been a succession of two or more bad seasons, the present prices of grain are act much above the normal.

There are no private irrigation works in this District, and the following rates are obauged for the supply of water from Government Canals:—

The rate is collected on the area actually irrigated, and in all cases of deficiency of canal water, remissions are given on a consideration of the extent of the crop failure. When water is supplied to land already assessed for water advantages, the amount so included is deducted from the charge leviable according to the scale given above. The canals are all auxiliary works and maintained from Imperial Funds, and cost, on an average, from Rs. 2 to 3 per acro irrigated. No change in the present system seems desirable in the present condition of the Province. Neither do I consider it advisable to encourage private outcoprise in the matter of important Inigation Works.

## General.

There seems to be no obstocle to the extension of Irrigation arising from sparsity of population and insufficient sapply of eatile. Dung is chiefly used for manure, and is not unalable in required quantities. The soil is, for the most part, suitable for irrigation. In some cases, the same field is irrigated from two or three senrees. The empty of water is precarions, and at present de pends mostly on the rainfall. Cultivators are, as a rule, poor and bove little or no oredit, and are therefore not in a position to find funds for the cultivation of rich crops. Fear of gahanced assessment also, to some extent, deters cultivations from improving the soil; and it would be an encouragement to them if Sanads were granted to the affect that no enhanced rates will be charged in future settlements on account of euch improvements.

In my opinion there should he liheral rules ahont remissions and recovery of Government daes, and no hard-and fast line used be adhered to as to dates of submission of applications for remissions, etc. When Government is satisfied of even a partial failure of crops in any part of a district, arrangements may he made to give early notice of the intentions of Government, and allow reasonable remissions to all affected therehy. Cultivators are generally illiterate; and it would, I think, greetly improve matters if they are ussured that, in cases of failure of crops from causes over which they have no control, fair remissions will, as a matter of coarse, be granted by Government.

I do not think the sxtension of Irrigation is likely to injute unirrigated lands by attracting oultivators to the irrigated tracts, because the Gnjarát cultivators stick to their homes in particular localitios, and, being very conservative by nature, and averse to changing places of residence, etc. Knrther, orops of all sorts, both irrigated and unirrigated, have a demand in the market; and every man has his own ways of thinking and liking. Consequently, there seems little or no chance of unirrigated parts heing neglected. Irrigation is yet in ite infancy in Gnjarát, with much room for its extension; and though cultivators do not as yet fully appreciate its advantages, I have now and then come across a number of inctances in which they expressed their willingness to cron give up a few acres of land free of change for extension of Irrigation. The exact information in regard to these cases may, if required, be traced from the Executive Engineer's records. I also remember several instances in

which coltivators applied for additional channels, and further facilities for irrigating more land.

ther facilities for irrigating more land.

In conclusion, I beg to be allowed to express it as my oplaien that though, fortunately, this district, owing to the fertilizing anture of its soil and the enterprise and andustry of its inhabitants is not so often liable to famine as other parts of the Presidence, yet, as we have had a severe famine and a continuance of three successive bad seasons—n atrice of things unknown within the last 50 or 60 years—it is very desirable in the interest of all concerned, to take timely and effectual steps to prevent a recurrence of the sadexperiences through which the province has been passing. From what I know of the rivers, ood the character of the soil of this district, I do not think canol irrigation can be profinely undertaken on an extensive scale. However, I soll of this district, I do not think canol irrigation can be profitably nudertaken on an exteosive scale. However, am sure that with a careful examination of the water-bearing resources of the country, much can be done in the shape of minor cause and drains which would afferd material protection to the cultivators in years of scauty as well as abnormal minfall.

Another important work to which I carnestly beg to invite the attention of the Commission is to increase the present supply in the Khari river from the Bokh, and all other available asurees. The undertaking of necessary droics in Dhandhula, Virangam and blokks, where large tracts remain uncritivated owing to their water-logged condition, also deserves serious coosideration.

The most effectual safe-guord against famine is, in my mpinion, wells; and Government should, I think, do all in their power to increase their mucher. I do not, for a

moment, mean to suggest that wells should be built by H. Dhiroj-Gorernment; but cultivature should be encouraged to sink them on their own nerount, with the help of liberal takary advances on easy terms, and of exemption from increased assessment. In fact, they should be assured that improvements, and increased profits due to their enterprise, industry and skill, would, in no case, he tased. More facilities may have be given by way of talent. also be giren by way of takarl.

Irrigation Tankr.—A large number of these have more or less, salted up. They should be restured to their original coodition, and provided uith necessary plpe outlets, maste weins, Ac. Government oro bound to keep the lanks in proper repair, because collimators have been charged for water at the time of the Survey Settlement.

A thorough recommissance of the country may be ordered with a rice to the finding out of saliable places for large bonds similar in character to those in the Dholka and Sanand Talekas.

Sanand Talekas.

The above proposals if approved by the Commission, will, I am sare, prove an effective protection against famine, which would then, in coorse of time, le a thing of the past. I would not delay the undertaking of the clove works until another year of searcity recent, but recall formulate plans and start the former as seen as possible, so that, within the course of the next few years, considerable progress might be made and the prespectity of the country sufficiently assured to encourage further expenditate on them. All such works, other than wells, should, in my opinion, not be left to private enterprise, as they require un amount of Engineering skill and affect rorlous conflicting interests.

- 1. Q. (The President.)—You were for a long time in the Public Works Department ?—Yes.
  - 2. Q. About 35 years?-Yes.
  - 3 Q. Do you know Gujarat very well ?- Tes.
- 4. Q. How long is it since you retired?—More then three muda-half years ago. I retired in August 1898. Since then I hore served for three years in the Improvement Trust, Bambay; I retired from there only six months ago and am now in the Ahmadabad Municipality.
- 6. Q. You have sent in a long themorandum which is full of important information. You say in it "ourthen dams, not exceeding 12 to 14 feet in height, can be safely constructed without measurery core walls" would you not make them higher?—Aot in black soil without n mascory
- core.

  6. Q. Have you repaired many tanka?—I have repaired a number of irrigation tanks, but have not made now tanks. I repaired tanks which irrigated over 50 nores because only such tanks were under the Public Works Department. I repaired a lot of them.

  7. Q. I understand that Government is supposed to repair all tanks?—Till 1892 there was a rule that all the tanks should to repaired, but since then all tanks has been usele, and an order has issued that all tanks giving more than a certain rescause should be repaired by the Public Works Department.

  8. Q. I understand that the vidagers who have small
- S. Q. I understand that the vidagers who have small tanks consider that they have a right to demand that those tanks should be repaired by Government f-Xes.
- 2. Q. Yon say "the only existing Government Irri-cation works in this district are the Hathmatl Canal, Khari Sluices and Khari Cut Canal."—Yes.
- 10. Q. Were you employed in the preparation of the Khari project?—No, but I had suggested during my time some improvements to the Khari.
- 11. Q. There is a reservoir for the Buthmati Canal in the I'dar State !—Xcs.
  - 12. Q. Do you know the Sabarmati Canal ?-Yes.
- 13. Q. In you know if there is a sufficient catchment area—Inring the resease of ordinary min, is the reservoir goine full f-Yes; in ordinary times it is full.
- 11. Q. To you know if after extraordiousy rain it over-
- 16. Q. Po you think there would be any difficulty in raising the write I think there would be no odvactage in
- 16. Q. Why f-Breams in the first place the cost will be very great and the return will be disprepertionate to the cost.

- 17. Q. You say that "proposals for increasing the supply in the Khatl from the Pokh near Parintij me under consideration for several years, and if they are carried out, a large portion of the Daskroi Talaka in Ahmodabad, and of Matar in Knira will be greatly benefited." Have you studied that question ?—No. I had an idea that some changes were proposed and I had to go through the project and make certain estimates.
  - IS. Q. Do you think it is a good project ?-Yes.
- 10. Q. You go on and say "there is any amount of colturable land available in this district." Why was it not thin advantage of—I learn from Mr. Beale's report that irrigation was not tried there. There ims not been very much irrigation?—No.
  - 20. Q. Is all the water used that comes down ?-Yes.
- 21. Q. Is it used for rice?-You roostly for rice, wheat nad grain.
- 22 Q. How long do these canals run !- Throughout tho year.
- 23. Q. In a year of drought is there water?-No, I think not.
- 21. Q Hore you heard whether any aurrey has been made of the whole of the catchment bosin of the Khari to see whether they could make a storage reservoir?—I do not know.
- 23. Q. You say, "in my opinion more satisfactory results could be secured from canals of small lengths from the Meshwa and other rivers." How long does the Meshwa ran F.—All the year round; I don't know the discharge.
- 26. Q. You say "in my opinion the construction of wells should be stimulated by all possible means, and as they afford a really effection protection from drought and families. nstord a reolit effectival protection from drought and sanine, sufficient inducement by liberal advances might be given for their construction in large numbers." Practically what you propose to do is to make the terms easier than they are now?—I think people may be given advances on reasonable terms in order to save themselves from any loss; the advances may be recovered by instalments in twenty or thirty years and rate of interest should be 5 per cent.; if you can reduce it so much the latter; the smoller it is the better; the advances may be given in iostalments os the works progress. works progress.
- 27 Q. How is it done now?-I think in two instalments; I do not know.
- 24. Q. What do you arguest f.—Give them small sums I would give them advances from time to time, but there should be every facility for payment, and there should be no
- 22. Q. Do you think delay provents people from securing udvances?—Yes, it does.

- H. Dhirai . ram.
- 30. Q Yon are against Government eenstructiag wells P-
- 31. Q. Because the cast would be greater than the cultivators could do it for ?-Yos. 4 Dec. 01.
  - 32. Q. Is there any difficulty about drainoge of water-logged lands ?-Yes; the land has always been waterlogged.
  - 33, Q. There is no more land going out of cultiva-tion?—I do not think so, there may be a little in a few places.
  - 31. Q. Do you see salt on the surface?—No; I do not think it is due to irrigation; I think there must be some salt in the soil. Under irrigation a much cropped soil may become saltish; otherwise I do not think it does so.
  - 35. Q. Do you think there is any reason to suppose the efflorescence is getting worse than it used to be !—I do not think so.
  - 36. Q. Havo you ever heard of the effects of drainage upou land which is water-logged—Are water-logged londs improved by drainage?—Yes.
  - 37. Q. There are a good many drains, I understand P—One drain was cut in the Dhelko Taluka after 1872, and, on the whole, we found it useful.
  - 38. Q. Have you heard complaints against them f-I have not; there are not many drains in this district.
  - 89. Q. Yon conclude your memorandum by saying "I do not think canal irrigation can be prefitably undertaken on an extensive scale." You don't think one could connect the existing tanks in Almandand by canals with rivers so that you can fill up the tanks by flood?—Yes, we may in places if proper arrangements are made. Inquiries in this direction are desirable.
  - 40. Q. (Mr. Higham) -Does rice require 5 or 6 waterings between July and October !-Yes.
  - 41. Q. Is it advantageous to encourage rice cultivation under tanks which are liable to fail?—Yes; generally they help to assist the rice crop.
    - 42. Q. Do you know this district well ?-Yes.
  - 43. Q. Would it be possible to arrange to fill a large number of tanks by means of channels taking off from the rivers ?-I think that could be done.
  - 44. Q. From what rivor or rivers?—The Meshwa and Khari rivers.
  - 45. Q. I suppose these rivers run dry every year?—Yes; but the Sabarmati does not rundry. During the rains no rivers run dry. It depends upon whether there is sufficient
  - 46. Q. The channels would not rnn dry in the rainy season?—In some of the rivers they would.
  - 47. Q. The spill channel would be very deep?-Perhaps; surveys would be required.
  - 48. Q. Are the Sabarmati banks too high?-Yes, abero Ahmedobsd.
  - 49. Q. Have you ever seen tanks filled from the river?-No.
  - 50. Q. (Mr. Ibbetson.)—You say you do not think that the Local Fund could assist unterially in extending irrigation?-Yes.
  - 51. Q. Becanso you do not think it fair to spend Local Fund money on irrigation ?—Yes.
  - 52. Q. Sappose Government were to find the money and nliet the net revenue to the Local Boards, would they he a suitable agency for making small tracks and reparing them P—I think it would be better to remit the revenue on those small tanks, which are paying under Rs. 20 or Rs. 30. I think the people would rather repair the tanks themselves than pay taxos.
  - 53. Q. Do you think the people would do that?—If they know that the water-rate was to be remitted I think they would.
  - 54. Q. If the assessment is taken off, do you think that they will keep the tanks in order?—Yes, I think so.
  - 55. Q. You think that would be botter than giving the Local Boards the revenue and asking them to keep the tanks in order? - Yes, otherwise there will be great bother and the return will he very small.
    - 56. Q. In the ease of these very small fanks !- Yes.
  - 57. Q. You say the people do not use much tank water for irrigation in good years ?—They take only one or two waterings whou there are late rains.

- 58. Q. You mean not much water is ased ?-Yes.
- 59. Q. They only want water when it is of great impertance to have it ?-Yes.
- 60. Q. And then they are ready to pay a substantial rate for it  $\ell$ —Yes.
- 61. Q. You say the average annual cost of repairing these tanks is about one-third of the water revenue; that seems a high propertion?—What I mean is this; suppose we have a revenue of Rs. 300 and we spend Rs. 100 annually, the tanks can be kept in proper order.
- 62 Q. Would they require Rs. 100 every year for repairs?—No, I do not think so; it may be every 20 or 30 years. The tank will be silting and you would have to ınako eertain repairs.
- 63. Q. Every 20 or 30 years you have to spend Rs. 2,000 or its. 2,500 in clearing the tanks !—I think so.
- 64. Q. I see that the rates on the Khari are double the rates on the Hathmati Canal ?—Yes,
- 65. Q. Why is that ?—I do not know; that was settled before I came here. I think the soil is not so rich as the soil on the other side—it is a poor country.
- 06. Q. You say that onlinneed assessment deters cultivators from making wolls? - I do not know whether the people fully understand the matter.
- 67. Q. Has anything been done to make thom doubt that the necessment will not be enhanced ? I am not quite certain; but the general impression is that the assessment will be enhanced.
- 68. Q. They could be given sanads Would—that be a good thing?—Yes.
- 69. Q. Supposing you tell thom that the revonne is enhanced on account of the rise is prices, do you think they will accept that explanation as true?—That could be explained, but I have doubts about the general rules.
- 70. Q. Do you think the explanation would do?—Yes; it may be tried.
- 71. Q. You are in favour of Government building wells on private lands?-No.
- 73. Q. Do you think the Government can build wells as cheaply as the cultivators !—I do not think the Public Works Department can build them as cheaply as cultivators though they could baild them better.
- 73. Q. (Mr. Rajaratna Mdlr.)—I find that the area irrigated in 1884 is 28,000 and in 1886 the actual irrigated area was 35,000. Is the decrease due to deficiency of supply or to disioclination of the people?—We utilized all we could get.
- 74. Q. You utilized the whole of the water available?-Yes.
- 75. Q. Yon say there are orders that only tanks irrigating over 50 acres are to be under the Pablic Works Department?—Yes; at present they are under the Public Works Department.
- 76. Q. And those irrigating less than 50 acres?—They are under the Rovenac Department.
- 77. Q. The majority of the tanks are irrigating less than 50 neres ?--Yes.
- 78. Q. More than & P -- A little more than 1; that was the figure when I was thoro.
- 79. Q. In your written answers you refer to the drainage works at Viraugam and Sanand?—Yes.
- 80 Q. Have you heard complaints in some parts that they have proved injurious to the cultivator's lands P—No I think they serve their purpose very well. One drain was made in Virangam and another in Dhanduka; there are no complaints about these.
- 81. Q. Some of the witnesses say that the rayat went the length of filling up these drainage channels?—That may have been the case since I left the department.
- 82. Q. (Mr. Muir-Mackenzie.)—Do you know any thing of the Chandola tank in which a charge was made for extra water?—Yes; the question was started in my time.
- 83. Q. Will you kindly state the virenmetances of the case?—Before the Chandela tank was built certain lands were assessed with water-rate; then in my time certain people took water from the tank for the purpose of het weather crops, and I wanted to charge them a water-rate because the original enpacity of the tank was considerably increased at the cost of Government. Then we received some petitions in which it was stated that we wore

not entitled to charge an extra water-rate as the extra capselly of the tank had been already assessed, with the

84. Q. (Mr. Illetern.)-You were not allowed to raire the water-rate :- No.

85. Q. On account of the improvements !- Yes.

SG. Q. (Mr. Mair-MacLensie.)—Were Government informed?—I think the matter went lo Government; I sent all the papers to Government.

[Mr. Ibbetson.—It is a consultated assessment?

-Mr. Muir-Mackenzei.—Yes; a consolidated assessment caunot be altered.]

87. Q. You said that you would like to let water-rate go on small tanks and leave the repairs to the people?—Yes.

88. Q. Are you aware of the orders of Government which direct that whenever a man, owing to the disrepar-

of his tank, finds that he cannot gel water on his tand and applies for remission of water-rate the application should be considered?—It has been passed since my retirement.

[Mr. Ibbetson.—He has to apply for a remission? 4 Dec. 01.

Mr. Muir Mackenzie.—Yes; the orders of Government were that the water-rate should not be remlitted unless some body asked for remission.

Mr. Rajaraina Mair.—Is it permaaent remission or is it granted each year?

Mr. Muir-Maclenzie.—If the tank is in disrepair a man does not get water then it is permanent

Mr. Ibbetson.-Next year if you repair the tank

Mr. Muir-Macken-ie,—That case has not been considered. If people apply for remission the matter will be investigated.

WITNESS No. 18 .- Mr. GARESH GOPAL PANDIT, Landowner.

Answers to printed questions.

#### A .- General.

My an wers refer principally to a portion of the Daskroj. Sanand and Parautij Tolukas in the Ahmadebad District. But I have travelled n good deal and hove observed the agricultural statu of things wherever I have travelled, and so my answer, may refer to other localities also. I am ucultivator in the first two talukas, have set up steam pumps at Futchwadi and Bakrol au the Sanand Taluka for irrigating my lauds in these two villages. I have a friend in the Parautij Taluka; through him I have hecome acquainted with that tsinks also. ted with that tainls also.

- 2. I have no figures by me by which the rainfall averages can be calculated. But the general rainfall is from about the ead of June to the end of August. There is hordly any from January to June. But of late years it is very irregular, inenficient and fitful.
- B. (1) In my opinion there is no obstacle arising from sparsity of population, but enterprising and wealthy cultivators, who as such no very few, are wanted.
- (2) The supply of cattle la generally insofficient owing to want of sufficient free pusture laud nod growth of fodder crops, which require to be encouraged by remussion of a sessmenta on lands on which plenty of fodder crops are grown. I occase of cattle by judicious breeding and abundant supply of dry and green fodder will be very beneficial to dry as well as wet cultivation. The families affects and destrops cattle more tima msn.
- affects and destroys cattle more tima men.

  (3) The supply of manure is insufficient and most of the stuff is not properly utilized. The principle that soil clay is the Cat disinfectant and storer of ammonia on necount of formation of eyele of double silicates of alumina and soda, alumina and hune, alumina and potash and alamina and numenon is not understood. The ness of salt is prohibited by the heavy excise doty over the most essential ingredient of food of man and cattle and a very useful article of manure for land. Booes and boso meal are experted and not utilized in manuring Indian soil. Instead of talari being given for manoring land, if manure is provided at a very low cost to cultivators, it would be mach better. The State may undertake the production of salino manures, for in that case the Excise Department of Government would bring no hindrance in the way. All agriculmannes, for in that case the Excise Department of Government would bring no bladtance in the way. All agricultural improvements consist in the production and utilization of useful manness are not manting in India. But there is want of enterprise and it is the duty of the sympathetic Government to erecurance enterprise wherever it finds it, if it enterprise itself show the way. Irrigated land requires more manure, as much of it is washed by the lower strata, and nearly is utilized in building up the ercp. Production of manure and use of it on a large sale will make irrigation more refit dile than at present. more profitable than at present.
- (4) In my spinion no soil is unsuited for irrigation in 18 in my spinen no source answer for irrigation in fraint witers surface evaporation caused by exceeding forther for drainings, nuderground as well as sorface. Irrigated black and will improve under underground distance. I should think.
- (5) Uncertainty of irrigation water-supply will be a great landers see to valuable wet crops, as the money and labour fold out in them will be wasted. In dry oner even the control of the and risin any ply will be a great help, when the rainfall is fitful and insufficient.
- (6) Lack of ea; ital for the initial expenditure and of for is for the more experience cultivation of irrigated on peater and the great obstances to the extension of irrigation. It is very deficult now for educated and enterprising culti-

valors to horrow moacy from capitalists, for owing to the so-called "Amendment" in the Revenue Code all right over the land except that of cultivation is taken away from the cultivator. He cannot sell or mortgage any portion of it. Copitalists will not therefore advance money to cultivalors for necessary improvements. It hecomes therefore the duty of Government to help the holpical but cuterprising and educated cultivator in his works of irrigotico.

Mr. G. G.

- (7) Fear of rent being enhanced or revenue assersment increased will no doubt act as an obstacle to the extension of irrigation. Fixed settlement will remove this difficulty.
- (8) Uncertainty of tenure or defects of the Tenancy Law throws great obstacles in irrigation being extended.
- (9) Pororly, general igoorance, want of even redimentary education, the general apathy on the part of Government officials that come in contact constantly with the agricultual population, etc., may be mentioned as other reasons that directly or indirectly serve as obstacles to the extension of irrigation.
- 4. Lands irrigated from works constructed by private capital nie, as far as I know, exempted from enhancement of assessment, during the tenure of the Surrry Sottlement, in which the irrigation work is constructed.
- 5. Loans under the Lind Improvement Act are not freely taken by the people for various reasons; some of them may be mentioned as follows:—
  - (a) Machinery of Government for granting these loans is too intricate.
  - (b) Villago officers through whom these loans pro settled are generally corrupt.
  - (c) Loans when granted are too late, i.e., not timely.
  - (d) A portion of the loan given does not reach the cultivator.
  - (e) Sympathetic expert udvice from a Government who is empowered to grant loans and who is a man of good character of established merit, will go a great way in slopping all sorts of corruption, and encourage entitivators to make irrigation improvements on their lands.

I would recommend the measures suggested in questions I to 6 according to circumstances to be considered by a body of village Pacebaynt presided over by the Mamlatdar or bis Aval Kurkun of the taluka in which the land lies.

- 6. No. Irrigation would attract those only who are enterprising as well as those who have not got sofficient means to carry on their ognicultural husiness in their own localities. Exceptionally bad years would drive nway people from healities where there is no water, or very facts.
- Yes. I have people from the Dhangadin State come to my irrigated lands to cultivate. People of Patchwadi and I akrel would be glad to take my primped water if I would give them in their lands. But Government has restricted me to certain sarrey numbers only to which I can give water without having to pay any additional water-rate.
- 7. Irrigation would increase the value of the produce of lacd.

double by (1)

three or fourfold by (2).

It will remain stationary under (3) (0); in (5) (5) will be no good as in (3) (0); in (3) (c) at will be tair other.

Mr. G. G. Pandit. 4 Dec. 01.

- 8. My estimate of the increase in the total annual value of the produce per acre due to irrigation would be nearly double on the average of a normal term of years, and 3-2 in a year of drought.
- g. In the Daskroi Talnka we pay Rs. 7 per acre for monsoon waterings, when rain is not sufficient or timely for ricecultivation. The supply is given from the storage made in the Chaudola Tauk from the Khari Cnt. In the Parantij Talna, they pay Rs. 3 per acre, under the same circumstances. These rates are paid on the area of the land actually irrigated.
- which has been continually irrigated during monsoon, and which lies in the immediate vicinity of the Chandela Tank storage on a low level. Such lands, I think, can be improved by deep ploughing and proper mannring, by drains all round the field, if possible, by growing such crops as would take up the too much moisture and the salts accumulated on the land. I have seen some of the lands of Danu Limda near Ahmadahad spoilt in this way. I suppose the irrigation of the Danu Limda rice land is more than 100 years old. When the supply of rain water is plentiful, rice plantation thrives well, but when it is insufficient, the evil is increased. My experience of draining irrigated lands is that they romain free from the above ovil.
  - 12. Wooden plank dams or masonry dams are thrown

- across the Khari at Rayapar and water is thus raised in the river towards the source. This higher lovel of water in the river can irrigate all the low-lying lands in the vicinity of the river. In some cases storage tanks, which lie bolow the lovel of the rivor bed, but higher than the land to be irrigated, are stored with water and the low-lying land is irrigated then by means of canals. In a year of ample rainfall good supply is maintained for four or five months. In a year of scanty rainfall, the supply is hardly kept at a workable level even for a few days after the cessation of rainfall. In a year of drought there is hardly any water in the storage tank.
- 13. I would give the same answer to this question as I have given to question 7.
- 14. If the irrigation is commenced too late or casses too early in a given year of sourcity of minfall, its value is altogether destroyed.
- 15. Irrigation in a few cases is supplemented by irrigation from wells given to the same land. It is essential to those irrigation works which depend for their supply on small rivers, which depend for their supply of water on rainfall or on eterage tanks enpplied or fed by these small rivers.
- 16. I would answer this question as I have attempted to do question 8.
- 1. Q. (The President.)—You are a land-owner, I understand, in this district?—Yes.
- 2. Q. You irrigate your land with steam pumps ?-Yes; I have two pumps in use on my land.
- 3. Q. Are thoy on the river?—Yes; one is on the river and the other is on a well in the river-bed.
- 4. Q. What is about the height, which you have to lift the water P—Tho one at Fatohwadi 23 feet, and the other at Bakrol 27 feet.
  - 5. Q. What pumps are they?-Wynno's centrifagal.
- 6. Q. What is the diameter?—One is 10 inches and the other  $7\frac{1}{2}$  inches.
- 7. Q. Have you used them for many years now?—I have used them for two years.
- 8. Q. How much finel do you burn?—If the engine is in proper order, I hurn 50 to 60 mannds in the 10-inch pump is 10 hours, and 30 to 40 mannds in the other.
- 9. Q. Are you satisfied with the experiments ?—Yes; I would recommend other people to do the same thing. The channels should be pakka, as the quantity of water lost is great; and the carthen channels give way; I asked Government for help to make them pakka, but they would not do so.
- 10. Q. How many acres do you irrigate?—In the famine year, I irrigated 200 acres with the higger pump.
- 11. Q. What are the crops grown?—Mostly fodderorops: juari last year; and this year I have sown wheat.
  - 12. Q. They are not used for rice ?-No.
- 13. Q. Do you find that this distinctly pays yon?—It does not pay me yet, because I have not got proper channels: these give a great deal of trouble. I have to stop the pump now and then, to repair the channel.
- 14. Q. Are the channels above ground?—In the village of Fatchwadi, I have 1,200 feet of under-ground channels, a there was back pressure, and the under-ground channels sometimes burst. I also had high earthen channels, but these too gave way. I have now lowered the channels. My land is level, and there is now less trouble than before. Properly speaking, I have not had sufficient opportunity of testing the profitableness of the concern.
  - 15. Q. Have you used cotton stalks for fuel: they uso them largely in Egypt ?—Yos, I have.
- 16. Q. I suppose you can hardly tell what your expenses are per acre?—No.
- 17. Q. Do other people come to you and ask for the use of your pumps P—They ask for water; but I am not permitted to give it to any land except certain specified land. If I give water to other people, whose names are not included in the Government list, a water-rate is charged.
- 18. Q. Does that fact prevent them coming?-Yes, it does.
  - 19. Q. It makes it too expensive for them?—Yes.

- 20. Q. What is the water-rate P—Rs. 1 per acre. I am not charged for my specified land.
- 21. Q. (Mr.: Muir-Mackensie)—You have taken up waste lands ?—They were all oulturable lands.
- 22. Q. They were unoconpied P—Some I purchased from occupants; some I took from Government.
- 23. Q. (The President.)—Do you feel anxious this season about the lowness of water in the Sabarmati P—I think we can get water all from wells in the bed.
- 24. Q. Is there any idea of forming a Company to get more pumps?—If they see that my enterprise is successful, people might come forward.
- 25. Q. How much will your pump irrigate?—The 10-inch pump will irrigate 300 acres.
- 26. Q. (Mr. Muir-Mackenzie.)—Would it irrigate more than 300 acres?—If the channels held more water, I could irrigate more.
- 27. Q. (The President.)—Is your land close to the river?—Yes; there is only a village between.
- 28. Q. Did you import the pumps from England ?—No; I purchased them second-hand.
  - 29. Q. Are they satisfactory?-Yes.
- 80. Q. Does one Engineer look after both ?—Yes; I don't work them together.
  - 31. Q. How far agart are they?—Two miles.
- 32. Q. Yon say in your memorandum "the use of salt is probabited by the heavy excise daty over the most essential ingredient of food," it is the duty that has stopped that?—Yes, with excise we get 27 ponuds por rupee; I don't know how much is expise charge.
- 33. Q. You say ogain "bones and bone-meal are not utilized in manuring Indian soil"?—Yes; I suppose agriculturists do not understand their use. Government ought to make some provision for teaching agriculturists their use.
- 34. Q. There are Government farms and an Agricultural Department P-1 don't know of any here.
- 35. Q. Do you believe that, if salt was cheaper, it would be utilized ?—Yes; some of the cultivators understand its use; others will have to be told; and they will soon learn the benefits of manuring.
- 86. Q. Yon say in your memorandum "surface evaporation caused by excessive solar heat serves for drainage under ground as well as surface." Can you tell ns any facts about irrigation on black soil?—I have some soil in Fatehwadi, which does not deteriorate by irrigation: our solar heat is so great that a good deal of water is evaporated.
- 37. Q. Do you think any good has been done by inigating black soil: would it be the same without irrigation?—
- 38. Q. Many witnesses have said that black soil can get on without irrigation, except in exceptional reasons, and that it is waste of water to irrigate it?— That is not my experience.

- 33. Q. You say, in prescraph 5 of your memorandum, that there are many obstacles in the way of obtaining louns. Can you suggest any hop presentat?—At present application has to go through too village officers, and they have the equived by fair means or by fool, and then only will they forward the applications. It takes a long time. It took forward the applications. It takes a long time. It took more than a year before I got a reply, and that was in tha zerative.
  - 40 Q Was it n rep'y about takavi ?- Yes.
- 41. Q. What should be done?—A cultivator know if he is to get an advance as soon as possible.
- 42 Q. You say village officers are generally corrept?— Yer; especially the lower officers: big officials don't take the trouble to go into matters, and petty officials manage everything.
- 43. Q. What would you do to make the province better able to resist famine?—I should say that the rain water, which is now wasted, should be utilized by being stored in tanks, and more irrigation tanks should, if possible,
- 41. Q. (Mr. Higham.)—Where do your pomps lift water out?—One direct from the Salarmati river and the other from ? from a well.
- 45. Q How much do they deliver?—If they work at full speed, one delivers 18 likhs of gallous in 12 hoars, and the other about 8 likhs; but I cannot work thom at follspeed owing to the channels.
- 49. Q. What is the amount they irrigate?—On the bigger pump 300 acres and on the smaller one 50.
- 47. Q. Is it cheaper than raising by bullocks f-Yes.
- 45. Q. Are you quito satisfied ?—Yes; but I shall be more satisfied when all the arrangements are complete.
- 49. Q You carry some of the water through pipes ?-I have made an under-ground gutter.
- 50. Q. What is the matter with the channels?—There are holes in them through which I luse water. A good dowl of damage is also done to the land, and the chonnels give WAY.
- 61. Q. Da you poddle your chonnels?—I have used a little clay, but it does not hold woll.
- 62. Q Whot charge do you make to others for the supply of wat: ?—In n famine year I charged very little—Re. 1 per light which is a acre. Lately some people from Kathawar have come, and settled on my land. They find the seed, and I give them water and land, and we divide the produce equally.
- 53. Q. Hes any body else got pumps f.—There is another man who has had a pump for one aud-a-half years. There were come pumps in Khairs, but the river water has run down, and so the pumps are not working.
  - 54. Q You say in your answer to question No.9 " in the Dasknoi Taluka we pay Rs 7 per nero for monsoon water-lines, in the Parantij Taluka they pay Rs. 3 per nero, an let the same circumstances." Why is there this difference?—I don't know.
  - 55. Q (Mr. Ribetson.) -- How much land do you own?-- About 1.1(A) acres.
  - 66 Q. Is your occupation merely that of land-owner?-
  - 57. Q. Yoo say you have been irrigating black cotton soil with pumps !-Yes.
    - 58. Q. What crops do you irrigate ?-Juari and wheat,
  - 59. Q. Juari is grown in the monson ?-Yes, and also in the hot weather. I did not irrigate this year in the monto in, but I did in the famine year.
  - CO. Q. Do you think that the juari and wheat that you irrheated took more water owing to the black cotton soil than a would have in other soils i-No.
  - 61. Q. We have been told that a great deal of water runs to waste in black cotton sail; that is 10! your experience is to the contrary, i.e., that it requires here water. It can bold water for some those.
  - 62 Q After you have given water, if there has been no rain, does it require watering agon ?-Yes.
  - 61. Q. Do you mitture the whole of the orrayon irrigate b- Thy a dias a good deal of manure at present.

  - Ci Q Wist cr. p would that he good for f-Any crop.
  - cd. Q. U. any sell?-Yes.

- 67. Q. You say in paragraph 7, "the fear of rent Mr. G G. being enhanced or revenue necessment incressed, will no doubt act as an obstacle to the extension of irrigation." I thought that, in Bombay, the assessment was not 4 Dec. Ct. increased on secount of private improvements ?- I cannot
- 68. Q. You know the law is that it should not be increased !-It is a fact that it was increased.
  - 69. Q. You don't know why it was increased?-No.
- 70. Q. Nothing but a permanent settlement would re-more your doobts ?-No.
- Q. You say at Patchwadi and Bikrol, people would be glad to take water, if they did not have to pur the water-zate, what do they pay?-Half the produce, minus half the
- 72. Q. That would be more than you are getting from your own tenants P-I have not thought about it.
- 73. Q. (Mr. Rajaratna Mdlr.)—What extent of land was given to you free of assessment for irrigation by yone pumps?—I applied to Government to take water free of charge, and Government replied that I coold irrigate free of charge the land I then occupied.
- 74. Q. What was the area of that land ?-Neirly 1,000
- 75. Q. You can imigate the whole of that without paying anything beyond the dry assessment !- Yes.
  - 76. Q Do the orders of Government prevent you from selling your water to other ray at f—It is not the order of Government, but I know this by experience; ootside my specified area, there is a field which I irrigated, and because I irrigated it, they charged mo Re. 3-8 for the use of the water. I contended that it was necessary for me to have my channels through that field, but they would not remit the water. the water-cess.
- 77. Q Is there any injustice in Government chi a water-rate for selling your water to other people?—The injustice is this. People are allowed to take river water free of cherge, and if I give the water at my expecse, Government charges me for that,
- 78. Q. You are not making a free gift of it?—I was toking the same rate as I charge on my land.
- 70 Q Is it not fair, then, that you should pay a share to Government? What is the ordinary charge? -119. 1 per neie.
- 80. Q. What will the rayat pay you for the water P— He would pay no one-third portion of his gross proloce any day; I will charge in fature half the produce sainus half the assessment.
- 81. Q. What does that represent in each ?-About Rs. 40 to Rs. 45 per acre, gross value
- 82. Q And you gradge paying Ro. 1 to Covernment. The orders of Covernment do not procont you from extending your improvements?—No.
- 83. Q. You say in paragraph 6, "it is very difficult now for educated and enterprising cultivators to borrow money from capitalists, for owing to the so-called 'nmendment' in the Revenue Code, all right over the land, except that af calitivation, is taken away from the entireator, he cannot sell or mortrage any portion of it. Capitalists will not therefore advance money to entireators for necessary improvements." Have you any facts to support this statement?— That is the Act.
- 81 Q. How long has that been in operation?—I don't know; but I know that a somear would not lend me Rs. 5,000 on mortgage because of the new law.
- 85. Q. You can borrow from Government ?-I oskol Government for Rs. 10,000 and Government would not give
- 86 Q. What was the reason ?-Probably the reports of the District Officer.
- 87. Q. If it was for land improvement, Government would not refus. Did you require it for other purposes 9-1 wanted Rs. 10,600 for improvements.
- 88. Mr. Meir-Maclenzie.-Money had to be given to poorer people; that is my surmise.
- 89 Q (Me. Rajoraina Mdle.) You don't leud moves pousself :- No.
- 92. Q. It was said by some witnesses that Lanius will not advance in very for wells, is that the case ?—I cannot say now, under the new Act: they need to attack it.
- 21. Q. Wi ther obvarce it freely before !- Yes, to these ray's with whom they had desings.

Mr. G. G. Pandit. 4 · Dec. 01.-

- 92. Q. Would they give Rs. 1,000 or Rs. 500 for a well at a time?—No, not so much, if the cultivator was not a well-to-do man.
- 93. Q. Was this Rs 10,000 that you asked for for your channels P—Yes, and for cattle.
- 94. Q. You reckon that your cost comes to eight annas per acro per watering?—Yes, when all the arrangements are complete.
- 95. Q. How many waterings will you give for wheat? -Fivo or six.
- 96. Q. How many waterings for juari ?- Four or five.
- 97. Q. In an ordinary year, would you wantso many waterings P-Not in the rainy season': wheat would want gonerally about four waterings.
- 98. Q. In what month do you give the first watering? -In October and November.
- 99. Q. In an ordinary year, the land would be well saturated by that time P—Yes, and it would be ploughed.
- 100. Q. In an ordinary year, when would you give the first watering ?-If I had commenced sowing wheat, and if there was no meisture I should have to give it at once. In an ordinary year I should give it in November.

- 101. Q. This soil is mostly black soil?-Some is black some alluvial and some sandy, but most of it is black.
- 102. Q. The same as in Breach ?-Not exactly the same ; there is a good deal of sand in it.
- 103. Q. What sert of crops would it yield without irrigation !- It will give a cotton crop.
- 104. Q. Does black cotton soil crack much in the hot westher !-- Yes, it does.
- 105. Q. How doep is it ?-Fivo or six fest with kunkur below.
- 106. Q. Havo you had any experience of irrigating atten ?—No: I have a small area on which I have irrigated cetton Pcotton, but the rats out it and I have not completed my expailment.
- 107. Q. Was it owing to the talatis' obstruction that it took a year for you to get a reply to your application for a loan ?—I cannot say.
- 108. Q. Do the village officers give you much trouble ?— They don't give me trouble, but they do not attend to my wants.
- 109. Q. You did not anbuilt your application through the village officers?—It went to the Gollector, but it has to go to the village officers for report.

## Witness No. 19.-Mr. Pestokii Menadhai Khengamwalla.

Mr. Pes tonji. 6 Feb. 02.

- 1. Q. (The President.)—You are part-owner of a steam pump ?—Yes.
- 2. Q. What is the size of the pump?—There are two pumps: one is a 12-inch one, and the other 15 inches.
- 3. Q What is the horse-power ?-12 and 15 respectively.
- 4. Q. Are they set up on the banks of the Sabarmati ?-Yos.
- 5. Q. Have you any land of your own in that place, or do you merely sell water f-I sell water to the cultivators, but receive part of the produce in payment, not cash.
- 6. Q. How much ?—One-fourth of the rice crop and one-third of the wheat and sugar-cane.
- 7. Q. (Mr. Higham.)—Is that for water only ?—Yes, the land is not mine.
- 8. Q. (The President.)—Has the cultivator to pay a water rate to Government as well?—There is no water rate on the land, Government have given mothe right to use river water free up to 500 acres; if I give water to over 500 acres. I have to pay, but the terms have not yet been settled by Government.
- 9. Q. How much do you irrigate now?—This year I have irrigated 300 acres; the pamps could irrigate 1.500 to 2,000 acres; they are not able to irrigate a larger area, because the channels give way under the pressure of water ; besides this, some damage is done by rate.
- 10 Q. Are you one of the partners of a company ?-Yes, there are two or three partners.
- 11. Q. Is there a ready demand for the water?—Yes, there is a great demand for it. This year there has been a complete less owing to the destruction caused by rate and locusts.
- 12. Q. Arcyou oncoaraged to go on P—Yes, we have made an application to Government for aid; we have asked Government for a lease of land in order to grow babul trees for fuel for the engines. If this is granted, our speculation might become a profitable ouncern.

- 13. Q. In that case, do you ocatemplate extending year cerations and buying more pumps?—We will extend our operations and buying more pumps?—We will work by putting up pumps at 2 or 3 other places.
- 14 Q. I sappose you could put them up at a dozen other places if it is prolitable?—Yes, one of my pirtners, Mr. Smikadum Escolbhoy, is a big importer of machinery in Bombay. At present the people are willing to put their lands under sugar-esne, but the solvears have no names to adverse. monor to advance.
- 15. Q. If takavi was available immediately, would they put a large area under sugar cane?—Yes, they want the monoy for seed.
- 16. Q. Do you consider that the rates are sufficient to make it a profitable business?—Yes, if I continue these rates, it will pay in the future. If I convert the produce into cash, it will come to about Rs. 6 to Rs. 6 por bigha, which will be equal to about Rs. 10 or 12 per agree.
- 17. Q. What is the lift of your pumps !- Thirty feet (centrifugal.)
- 18. Q. Isuppose the engines are pertable?—No, they are horizontal fixed eaglnes.
- 10. Q. (Alr. Higham.)—How many oultivators do you supply with water P—Two or three villages.
- 20 Q. How is the distribation managed !- A roster is fixed and the cultivators get it in turn.
- 21. Q. During his turn is a oultivator allowed to take as much as ho likes ? —Yes.
- 22. Q. I suppose the number of days a cultivator has to wait will vary with the orop ?—Yes, wheat takes 4 waterings; rice took 4 this year; sugar-cane requires 50 to 58 waterings, and is irrigated overy four days.
- 23. Q. That is not during the rains ?-No, but if the rein stops for a moath it requires water.
- 24. Q. (Mr. Muir-Mackenzie) Is cotton grown ?-No.
- 25. Q. Are there any difficulties in getting applications sanctioned ! - No.
- 26. Q. Have caltivators any difficulty in getting manure; -No : the soil is very rich.

## SEVENTEENTH DAY.

Ahmadabad, 5th December 1901.

WITNESS No. 20.—The Honourable Mr. F. S. P. LELY, C.S.I., I.C.S., Commissioner, N. D.

Note by witness.

The Province of Gajarat has for the most part been formed by allavion, a process which is still going oa. An arm of the sea which once separated it Mr. Lely.

from Kathiawar and is now represented by the Ran of Cutch and the chain of Isgoons known as the "Nal" has been filled up within comparatively recent times. The effect has been to silt up the lower courses of the rivers

5 Dec. 01.

of that region so completely that Instead of reaching the reachey provide out ever the country forming water-legged trasts with the ne cal accompiniment of saline efforcement. Such his been the fate of the Rimas which once empticilisely into the Ran of Cutch, of the Ularli, the Nilki, the Ilbadar, the Roth river in Sanaod taloka and others of small size. The same process is, if I am not insighten, going on all down to cross of Gujarat as far as the Toptic eggins the drainage of the conoty. The whole Gulf of Cunbay is being filled up with sheals, leaving only in manow and devious water-may, as may be seen on any clart. The Mitar taluka, once thoroughly drained by the Wariah nod the Maximati, is now so obviously determine the Wariah nod the Maximati, is now to obviously determine that Government have had to make one reduction in the a seament and will soon have to make another. The town of Combay, once upon the bank of the Mithi, is now moved from it by several miles of allavial bank. There are water-legged areas in through districts north and senth of the Kanbada and in the Olpad taluka of Smal. At the same time the popular voice is unnaimous that to the rices that comound these areas the volume of water Is much less and the leads higher than they were within the memory of living men.

- 2. If the above impression is correct, it errms likely that the successive rivers from north to south, beginning with the Bhogawa and Sibarmati, will silt themselves up and stagnate over the country, or find themselves other courses. In my chinico the sobject should be thoroughly examined and reported on by an expert Engineer, so that treadly-concined measures may be taken to prevent the deterioration that has begun.
- 3. Irrigation by Canal.—This is not everywhere possible and where possible it is not early and where possible. In the southern half of Surat district it is not needed, because, with a heavy and generally constant rainfall and a retentive soil, a second crop (legaminous) is grown after rice without any nruficial watering. North of the Tapit the soil becomes black and is devoted to cotton, when is not picked until the cold weather is over. It is said that watering makes it run to word and leaves, but however that may be, the extra cost nould not be recouped at present prices. Nor is there anything to take its place. The people would certainly not take canal water in the black soil country between the Tapii and Mahi ricers, or in the weat of the Ahmedabad district. It would also be superfluous in laud an retentire of moisture. In the sandy so I of Parantij taluka again, the Hathmati Canni has been a failare, because among other reasons the loss in the channel by percolation is coormous and because the rice beds will not held water without great wastage.

  4. The only tracts where a canal supply would be we'comed
- 4. The only tracts where a canal supply would be we'comed by the prople are adapted for rice being, the sand being mixed more or less with loam. In many villages on the Khari system the soil is so light that it would almost never support of fee crop to the end without the artificial supply. Even in other more relentive soils the latter rain fails in two or three years out of tre, but if water could be guaranteed through the cold weather, a second crop of higher or wheat could be secured (provided there was manure), whether the rice needed watering or not. The value of a canal reaches its climax in those villages where the soils are self-
- 5. Although annal inigation is not us a rule suited to flujant. I should not oppose extram well considered schemes. Objections are: (1) the great difficulty of scening supply which may be depended on in years of scening supply which may be depended on in years of scening ramply which may be depended on in years of scening ramply which may be depended on in years of the Ilathout and the Tapti carals, on engineering tables then on egricultural considerations; (3) the temperation to the entiraless when water is brought to them without effort to occasion their land and to overflood it. On all these points and an others, wells have the nelvantage. On the other hand there are tracts where though the land is good and tho enlivators intelligent, may of the wells are brackish. In those tracts a canal scheme might be considered if otherwise feasible, if a supply can be assured and if the soil is sailed to nee cultivation which is and will long be the chief crop in Gujarat to need irrigation.
- O It is for the size crop alone that the system of irriirright where gotton lanks in Gujarat came into gation lanks in Gujarat came into from Native rule. Their recessly is basedeen the fact that in polished years cut of 5 the yearly rainfall sofices for string, transplanting and bringing the plants forward,

lest fails at the lest when water is needed to mature them. They are sometimes nothing but basins in the corners of folds which conserve the early rain to be paid out some weeks later. They then run dry, whether large or small, for they are not dag deep. Their led should be higher than the surrounding country to allow the water to tun on to the fields by gravitation. It follows as of course that they are if no use for watering ruli crops, though they are often the means of saving a most valuable outtorn of rice. It may be mentioned here that the "Kannod" rice grown in Northern Gujant commands the top piles in the market, being the only sort the wealthy claves will cat. Successive good crops would probably pay the cultivator butter than sagar-cane.

- 7. The particulars of these irrigation tanks will be before the Commission, as also the declinations of the highest authorities that Government is bound in honesty to keep them in repair to return for the special water-rate which forms part of the assessment. They have not been repaired as they should be, for research the Public Works Department will explain. I have only to suggest that the preference given to people who contribute 10 per cent. of the cost should be abrogated. This would leave the Public Works Department coursely free to take up systematically groups of tanks year by year, which would tend to economy and thoroughness.

  8. It has not been the martice to give remissions of
- namy and thoroughness.

  S. It has not been the practice to give remissions of land revenue when these works fail. They should be given with reference to the water as distinguished from the soil. For if the crop fails, the whole fails and a semission of the water-rate only, retaining the soil rate, will not meet the cass. The division between the twa heads is under in the nurvey records but differently in every district, and there would be room for difference of opinion as to the correctness of the adjustment. I am myself of opinion that as a rule enough is not credited to water.

  9. The remain and construction of such works, if not
- 9. The repair and construction of such works, if not undertaken by a private landholder, concern the Imperial land receive only, and me nitogether outside the sphere of District Boards. When expenditure is incurred by the Public Works Department on an irrigation tank which is also a village tank used by the people for drinking, bathing, or watering eatth, etc., it is the practice in this dission to get a contribution from the District Board. If private landholders wished to undertake work of this kind on their own land, they could readily obtain takayl for it, but they never do.
- 10. I do not agree that a good deep rillage tank such as was dug in large numbers in recent famine time is useless even ulthough not used at all for dieset irrigation. In olden times it was one of the first benefactions that occurred to the man of means who wished to spend his money for the public good. A sheet of fresh water which holds out through the year is a centro of health and sweetness. It humidates the atmesphere. It is a means of cleanliness to man and beast. Above all it permeates to all the wells within its influence and corrects their brackishness if it exists. Remorkable instances of this could be adduced. On the whole, I am of opinion that in nrid, saltish tracts there is no more beneficial form of famino laboar possible than stuking a well-planced tank for storing rain water.
- 11. Similar to these are ender pounds in rivers where owing to rocky beds they can be made without great expense. In the river Wanki, south of Bulsar [Samt district), the B., B. and C. I. Railway Company made some years ago a masonry band with a sluice in order to provide a supply for their station near at band. The result is n permanent store of water which is a delight to the eye. By saturating the adjacent country and also by means of dekedis it has clonged a limited area into a perennial gardea. Many such londs and sluices would be possible in the small rocky rivers of that part of Sneat district, and also I should think in the appear courses of the Mahi and office rivers. They would probably not be remanerative to Government at first for sweet reasons, but they ought not to cost runch on well scheed sites, and they would conserve in the most lenshial form masses of water which now run off when. The people would slowly learn to take full advantage of them.
- 12. A inchern form of enterprise is the erection of the first parties are irrigational steam gamps on the Saharmati and one on the Watrak, and there may be others. The mater is generally supplied to the collivators

Mr. Lely. 5 Dec 01. 3fr. Lely. 5 Dec. 01.

in return for a half shore of net crop. These undertakings should be encouraged by Government by imposing reasonable and uniform aenditions, and the possibility of their great extension should be borne in mind when framing such schemes as the Sabarmati canal.

18. First, however, in the list of irrigational methods in Wells. Gujarat must be placed wells constructed by the people themselves. The fact that a cultivator is willing to take the risk and trouble of making the well and of drawing the wator is a security that he has the means to make it a success,—the knowledge, the enargy, the appliances and the monnre! The canal and the gravitation tank mode by Government guarantea none of these things. In restricting both the number of walls and the amount of water daily sapplied to the land the co-operation of the cultivators acts as an automotic check on over-irrigation which does not exist when water is brought witbout cansulting them and laid on their fields without any effort on their part. Consequently when sub-soil water is sweet, plentiful and at a workable distance from the surface, nothing more is advisable than to encourage the cultivators by easy guants of tukavi to dig wells. Unfortunately these aonditions are often absent.

14. I think the interest on works of improvement os distrakavi—Interest. tinct from mare "agricultural loans" should be reduced to 3 per cont., i.e., 4 annas per month. Whatever may be the cose in some other parts of India, it is certain that in most of Gnjarat in ordinary times the Soncar will lend for a sound improvement, such as a well, at 8 names per month, i.e., six per cent. per annum plus n small commission on "opeaing his bag." On loans for seed, buying cattla, subsistence of the cultivator, eta, he will of course demand more, and there is not the slightest reason why Government should not do so also and keep to their present rate.

15. I do not think the method of distributing takavi for Takavi-Promputude in distribution.

Takavi-Promputude in distribution.

Takavi-Promputude in distribution.

For koeheho wells and for seed, etc., do not come within the scope of this discussion and should not, in my opinion, he given ut all by Government except (1) in time of famine, or (2) to lackward races whom it is desired to free from serf-dom to the sovkar. It may be well that the officer distributing for these purposes should be able to carry money with him on tour and pay it out without any circumlocution. But in this Division the practice for larger loans is for the applicant to present himself once hefure the Mamlatdar to ask for the money suid again after the report by the "Villago Panchayat" to receive it. These visits to the Taluka Head-quarters are not regarded by the people us in nny sensen hardship and are of positive advontage as marking the gravity of the transaction. A man who really means to make a well will give himself much more trouble than that to interview the brick-maker or the mason, or, when

Takevi-Strictness of recovery.

Takevi-Strictness of recovery.

Takevi-Strictness of recovery.

Takevi-Strictness of recovery.

To genrly paymonts which he knows will be enforced with ragularity, even, for all he knows will be enforced with lands. It is not merely the chance of a bad year for be may hope for lenience on account of that. If a death or marriage takes place in his house and sweeps off all bis ready money the savkar will make allownooe, but not so Government. Hence he hasitates. On more than one coasion I have lately been teld by villagers that before taking large sums to build walls they intend waiting to sea how it fares with those who borrowed from Government during the famine. The difficulty is not an easy one to meet, for of acuse o loan for a ramunerative work must be recovered on business-like terms, and any ottempt through the village officers to take account, as a savkar does, of a man's private circumstanaes would only result in unbridled corruption. A general concession, I would suggest, is the recovery by easier instalments than have hitherto been usual. The life of a well being from 50 to 100 years or more, there is no reason why repayment should not be spread over 20 years or more. This would not be felt by a vigorous man. The smallness and the definiteness of the demande combined with freedom from dunning between-times would be realized by all as great advontages.

Takavi—Risk of total loss.

Takavi—Risk of total loss.

Man iu Sahijpur (Dholka toluko) who hy all oocounts

spent and lost Rs. 500 in this way last year. He had called in a Brabmin "Joshi" of local repute who profe-sod to find water with wand and incantations, but only succeeded in finding salt water. This merning I saw a well (in the Kaira district) which had first of all been dag and steyned to the depth of 20 enbits, giving swest water. The supply ran short and digging was continued with the usual wooden ring, 10 anhits at a time, until a ploutiful spring was reached at about 50 cubits from surface of ground. This was good to the taste, but after a year's trial turned out to he "chopdu", that is, its effect was to hind the soil together like glue and evanually stop all growth. The result is that the well on which nearly Rs. 1,000 has been spent lies unased and useless. The nafortunate owner told me with tears in his eyes that he had berrowed all the money in 1954 (A.D. 1897-98) from a sayker at 6 per cent. and had nothing to show for his enterprize but tha dobt. Many wells, especially in favoared tracts, give a sweet and full supply at 20 or 40 feet from surface. Some give none at all within a reasonable depth. Some are salt from the beginning. Some are sufficiently sweet for one watering hat not for more, and these are of some use for rice aultivation. Some are goed for eac season and then must ha anused for two or three. Some mest disappointing of all are sweet for a year or two and then gradeally turn salt.

18. The question is, can tha people be ossisted to meet these froaks of fortune? The use of bering tools (Shaeda) good down to 30 feet or so, is known to the people in many parts, and two or three are being placed at Government expense this year in various tslukas for fres loan. I am not, however, sauguine of much result. Either they will not find favour for want of expert direction, or being roughly and earelessly used they will soon get broken. Privata blacksmiths have already begun to supply them on daily hira, and in ordinary times it would seem better not to interfere in the business. The use of these shallow-boring tools will not however always or often prevent los, for permanent sweet-water is not often struck within 30 feet, and in most soils the steyning has to be put in boford that depth is reached. I notice below the suggestion that deeper boring nader trained men should be carried on in tracts where the upper water-beering strata are salt and it might be arranged that these parties may bore in the lond of any holder who is willing to pay the whole or, say, the half of their expenses, or, better still, a fixed fee. Cases in which the water is not salt but "chopdu" are much more rare. At present the cultivotor has to wait for a round of seasons before be can detect the fault. The Agricultural Department should have ot its service a laboratory where all snoh points can be settled at once for a small fee. Few of the people would resort to it at first, for they would have httle trust in its vordict. The sooner a beginning is made the sooner snoh agencies will justify themselves. With the spread of education leaflets to inform the cultivator whot is heing done and what is possible to him would be useful. Ultimately he would only have to get a boring made, deep or shallow, as may be incicated by the general water level of the country and gat a smuple tested hoth for merits and defects, though even then he would have to take the risk of the water subsequently turning salt.

19 It has been suggested that remission of takavi should Takavi—Romission to case be given in every case of failure.

There is much to be said for this proposal hut also many objections. It would lead to many and varied attampts at fraud which could only be guarded against by therough enquiries which the already everburdaned staff have little time to moke. The Collector might be given power to make remissions in hard cases, but this half and half solution would also be objectionable. A definite promise on which a claim can be based is necessary to praduce full effect and also to exclude favaaritism and intripue. On the whole I do not see haw Government can safely take upon their shoulders the risk of failure and am not very sure it would be desirable to do so if they could I would prefer to minimize the risk by expedients noted above and below—paragraphs 18 and 21.

20. It has been suggested that Government should go Construction of wells by still farther than this and undergovernment seems. Take the construction of wells on a wholesulo scale. I am entirely opposed to this. It would be a serious advance on a wrong line—the line of doing for the people what they can do for themselves. If wa build their wells wo nay as wall huild their houses. An experianced cultivator can judge bettar than any Government agency whether it will pay or act to make a well in a particular field. If he undertakes the risk and trouble it is the hest guarantee we can get that the position is suitable, i.e.,

near the village, that the soll is suitable that manore is arsitable, that water is likely to be struck. He is much more likely to be right on these points than a Government officer whose only interest in the matter is to show n return of work execute 1. Grauling however for the moment that more likely to be right, on these points than a Government officer where only interest in the matter is a shown return of work executed. Granting however for the moment that the latter is as good a judge as the former, the next question will be, who is to pay for the work? If Government is to pay, every one will want the free gift and have an equal sight to it and very few will be able to get it. Thus would have to be excluded where sub-soil water was indifferent or who could not use a well far mont of manner or would not for laximes (there are many such). In the weeling out of such holders heibery would be rampant, but even if they were fairly eliminared it cannot be seriously contended that the remaining lacky ones should be sopplied with a well at the expense of the State. Yet the cost could not be charged on them either in lump or by enhancement of the ass-sment at the sup by of the guaranteed term without their cancot, and no man in his sense would give his consent to have his work done by the Public Works Department. Not only would it be twice as expensive as if done by himself, but no man would willingly bring about his place a gang of subordinate efficials with their impertinent swanger and lard and fast rules when he could get the work done by his own people whose interest it would be to conciliate him and meet his wishes. The number of wells already in the country that he unoused is remarkable, either because of the badness of the water on because of the laximes of the owner or his wont of means in the shape of taskle, bullocks, mauure, dependants to help, watchmen to rrutee the valuoble erop. The resolt of a system of Government well-digging would probably be to greatly increase these unfrautial assets. "Three seres and a com" may be the ideal of reatio prosperity in Eng'and, but "three acres and a well" is by no means it to quivalent in India, though pupular writers often argue as if it was.

21. There are tracts where the surface water is sweet

21. There are tracts where the surface water is sweet 1Rep boring.

and scanty but where the people will on no account go deeper from a well-grounded fear of striking on brackish springs. In

others there is not even an upper sopply of sweet water. As things at present stand, noless there is an advacent river there is eathing possible in such tracte except perhaps a canal like that proposed from the Sabarmati. There are however indications which give some loop that in places deeper water still, free from all, with a head upon it, may be streek by deep boning which should be at stematically undertaken. In Brooch town there is a well in which from a depth of mere than 100 feet the water rises of itself to above the river level. In Virangam town, if my local informants are correct, a pipe was driven down below the brackish water and after it had tapped a lower and sweet epting was binken, that in jet of sweet water still wells up 2 or 3 feet above the top end of the pipe. It was in this line of rountry that Mr. Griestach recommended trid borings for an artesian well. Deep horiog porties for special areas should be organized, can under a supervisor who should be a skilled wechanic. They should porate wherever the general results are likely to be most instructive, but they should be free to bore in a private holder's land on terms as suggested above. land on ferms as suggested above.

22. It is not irrelevant to mention that in this province at all events the beorbeial avults af irrigation depend directly on supply of manure. In the best villages that is the real check on the increase of wells, for no shrewl cultivator will check on the merease of wells, for no shrewl enlitivator will spend money upon water unless he can make sure of keeping up the fertility of his land. It is antipusing how little has been done to lead the cultivator to exercise economy and resource in this matter. The used has become greater than ever here since the famion reduced the cattle by 70 percent. Mr. P. K. Subtinh's note on "Different systems of housing catto and conserving manner" published as an "Agricultural Ledger" is being translated into Gujurati and, if opproved by Covernment, should be circulated a very village. There are few now which do not contain some cultivators who can read and write, and much good might be done by the dissonination of useful agricultural information in vernacular leaflets. That however is wandering heyond the scope of this note.

- 1. Q. (The President.)—How leng have you been Commissioner of the Northern Division ?—About 5 years.
  - 2. Q. Were yoo here all through the famine !- Yes.
- 3. Q You have enhantited a very interesting memorna-dum. The opining pringraph as regards the silting up of the months of these rivers reveals a very serious matter and one that should be investigated ?—Yes, it is a very serious n atter indeed.
- 4. Q. You say in paregraph 3, "In the sandy soil of Purantij taluka the Hathmati Canal has been a failing because among other rousans, the loss in the channel by percolation is engineous and because the rice beds will not hold anter without great wastage "?—Yes, the country is not saited to rice cultivation. saited to rice cultivation.
- 6. Q Is it not worth while osing the water for wheat and barley?—Undoubtedly; it is used, when they can get water in the cold weather.
- 6. Q. I gather from the note sent in by Mr. Beale that 6. Q. I gather from the note sent in by Mr. Beale that measures have been taken to prevent the loss from the Canal; assuming that this is effective, would the canal then be a success, if the nater did its full massare of work?—I should not like to speak definitely. My impression is that the result has leen already to deteriorate a good deal of the land hy efficience and the general complaint of the vallagers also is that the land is getting exhausted because their supply of manner is not sufficient; the water being brought to their deers tempts them to over-water and over-crop the LeTa.
  - 7. Q. Is the efforescence on the increase !- Yes.
- & Q. bill it not exist before the Canale were started?-I cannot say, it probably did.
- 9 Q. You say in paragraph 4 "The only tracts where a canal supply would be welcomed by the people are a lopic! for rice fields, the land leing a list more or less with long." for nec heids, it clead leng a feet more or less with lorin. It state out yout in Enjand amorting to these conditions where it is likely that even trigation can be introduced?—If it would be more or less the line the Salarwati event is supposed to take, whether it is derivable or not take question; it would less to the people growing a second cup that notify the chiefly reculsted by the supply of nature; there is no doubt they would grow barley and wheat.

- 10. Q. You say the canals are broken reeds, for the water fails in time of need; would it be worth the cost to have a thorough survey made of the catchment husins to the north of this District, to see whether it was possible to store water?—Yos, especially in the Panch Mahals.
- 11. Q. The best plan would be to have the catchment basins exhaustively examined f-Yes, certainly.
- 12. Q. We were a sured that brackish water was very good for barley P-Yes, if it is not too brack'sh; nod it is not had for wheat.
- 13 Q. Mr. Mallison says it is to be recommended for tolonces? -Yes, particular salts.
- 14. Q. You say in paragraph 7, "I have only to suggest that preference given to peaple who contribute 10 per cent of the cost should be abrogated. This would leave the Public Works Department entirely free to take up systematically groups of tanks year by year which will tend to economy and theroughness." I thought that the Public Works Department, quite apart from this rule, takes up any tank needing repules?—A certain amount of expenditure gues on, and as those who pay 10 per cent have the preference, the others are more or less out of it.
- 15. Q: It seems to me a little hard that if villages are willing to contribute a share that that willingness should not be taken as an indication that their necessity is great and that prefer nee should not be given to them?—That simply means that they are ready to pay more than is due from them rather than unit get it at all.

  16. Q. Do you think there is a moral obligation on the State to keep these tanks in order?—Ye...
- 17. Q. I beliere that when the last Remane Settlement 11. 12. I believe that when the last Review Settlement was trade they were in such had order that the Settlement was made him in consequence. If the cultivator found, is could not irrigate from a tank and he asked for a remission, would it be given to him?—Yes, the huddedar often at this from as ing for a remission, believing that if he gets it, it will mean currendering his rights.
- 15 Q. We heard that there are 1,200 tools in Almadatad? -Yes.
- 19. Q. Would it be possible to fix a certain limit for those that Government declines to repair and make a remission if no repairs are made? That is already done.

Mr Lely.

Mr. Lely.

- 20. Q. And the assessment remitted?—We remit the assessment if we are asked to.
- 21. Q. With reference to what you say about sloicee and bunds in paragraph 11, this refers merely to using the broad channel of the river ?—Yes.
- 22. Q. Can you quote a case?—Yes. Colonel Present who was a very experienced officer here 30 or 40 years age strongly recommended that a great deal might be done on the River Sheri by making bunds, but that is a point that requires very careful examination, it is the common hellef that the water is "chapadae" (creates a only soil).
- 23. Q. We were told yesterday that Sowcass declined to lend money for the construction of wells?—I don't nt all helievs that they wou't lend money for wells in ordinary times.
- 24 Q. It was said that the bania would not lend a large sum?—He would lend money if he was sure it was being properly used; as a matter of fact no rayat can dig a well without help from the bania unless he gots takavi from Government. If a bania is satisfied that the money is going to be properly spent he will lend it.
- 25 Q. I gather that you do not think there is any material inconvenience caused by delays in granting advances ?—No.
- \*\*6. Q. We heard yesterday that there was sometimes five and six months delay?—Tout would be exceptional, I think. It depends upon the personality of the officer concerned; there need be no great delay.
- 27. Q. Do you think it would be a popular measure and an expedient one instead of giving advances, merely, to give the money and access wet rates in future?—I should think it would be accepted with reasonable arrangements, but a man would sooner have the well his own property.
- 28. Q. It would be his own property all the same?—As long as there is necessment be thinks it is likely to be increased.
- 29. Q. You suggest the reduction of the rate of interest to 3 per cent, would it stimulate the construction of wells largely it Government were to give it free of interest alt gether?—Yes, I think it would.
- 30. Q. As a famine protective measure? Tes, I should think so.
- 31. Q. If it was given out on these terms for the next ten years or something of that sort?—The Government made a similar concession on takavi advances during the time of famine and it was very much appreciated.
  - 32. Q. The moral effect would be good !- Yes.
- 33. Q. You think that one cannot go wrong in multiplying good wells?—Not if the people have the construction in their own hands.
- 31. Q. You say in paragraph 16 "A general concession I would suggest is to recover by easier instalments than have hitherto been usual" and that "ropayment should be spread over 20 years or more." I understand the law allows 20 years?—I dun't think the practice is so.
- 35. Q. What is the practice?—It depends upon the idio-syneracy of the Collector, I think it ordinarily is not more than 10 to 12 years.
- 36. Q. You on the whole recommend that remission on taken should be given in everyease of the failure of a well?—No, it is a very doubtful point.
- 37. Q. Supposing a man come to the Collector and applied for assistance in boring and it was given; if that well turned out a failure I suppose you would help the man then P-Yes.
- 3S. Q. On the whole what measures on the part of Government do you think advisable to protect this Province of Gnjarat and to make it more fit to withstand famine?— I don't think anything beloic is possible; there are many useful minor measures; I should thoroughly prospect the Dohad taluka of the Panch Mahals, then, I would notycete the construction of bunds in rivers; of course the oncient system of tanks for assisting rice cultivation should be kept in perfect order; lastly, I should develop wells as freely as possible.
- 39 Q. Turning to the question of relief in famino, what is the best form of work ?-Digzing, certainly.
- 40. Q. Would you employ famine labour on small tanks?

  -Yes, because there is really nothing elss.
- 41. Q. We have heard in some places of long earthsu dykes placed across the country to intercept the water,

- would you recommend that sort of work?—They would only be possible in certain localities, e.g., to in except the fixed water in the central and weeken parts of Ahmadabad. I don't think it would be possible an any large scale owing to the conformation of the country.
- 42. Q. We have had some ovidence regarding the water-logging of certain districts and were told that in some places drains are locked upon with enspicion?—Undenbtodly a drain is a great been in some years and a great curse in others.
- 43. Q. We have heard the objection to a drain that it flows too fest end washes off the good soil P.—That is so.
- 44. Q. Do you consider these drains a good form of famins-relief work?—Certainly, most excellent.
- 45. Q. The famine work programme is got up, I understand, by the Executive Engineer in concultation with the Collectore; does it come officially before you?—Yes.
- 46. Q. Is it being kept up pretty well in these parts?-
- 47. Q. Is there any ruls observed as regards half-yearly or annual revision?—Yos, they are sent in annually to be ravised.
- 48. Q. (Mr. Higham.)—We have heard a good deal about the drought in these parts, but does it over happen that land is dameged by excessive floads?—Yss, before the great famine in 1899-1900 there was more damage by flood than by drought.
- 49. Q. That is to say rivers overflowing their banks P—Yes, in 1875 the Sabarmati overflowed and did enarmous damage, destroying valuable land. The country has not recovered from it yet.
- 50 Q. What was the effect of that flood !-It overlaid the good soil with sand.
- 51 Q. Does it draw up the salt?-No, it does not lie long enough for that, it runs over the country.
  - 52. Q. The only damage is the sand ?-Yes.
- 53. Q If the country is tharoughly saturated by a flood of that sort, does it have any effect on the wells ! —A great many wells got thrown ont of uso; they got silted up.
  - 54. Q. They have not become soline ? -No.
- 55. Q. Is there sait eillorescence?—Not that I am aware of; the flood comes and goes very quickly.
- 56. Q. In any proposal for putting weirs across the rivels there high floods would have to be considered?—Undenbtodly.
- 57. Q. In paragraph 5 you speak of the "dauger that projects may be adopted, as were those of the Hathmati and the Tapti canals, on ongineering rather than agricultural considerations"?—Yes, 1 don't think from an ogricultural point of view the Tapti canal is a very promising scheme.
- 58. Q. Is it not now being reconsidered P-Not that I nm aware of.
- 59. Q. I think the Bombay Government was asked to consider the question, you have beard nothing about it?—
  No.
- 60. Q. Am I to understand that on small or 'one man' tanks the water assessment has been taken off?—The Government does not take the initiative; if the people apply an onquiry is made, and if they do not get water we remit the assessment; if they get a water-supply the assessment remains, oven if Government have no intention of keeping them in repair.
- 61. Q. In coso it was necessary to employ relief labour, would it be out the employed on small tonks?—It might, but at most would not give very much labour.
- 62. Q. I mean village labour ?-Yes, no doubt, many have been repaired.
- 63. Q. Are they entered in the programme?—Yes, the small cases are clubbed together in one item.
- 64 Q. You say in paragraph 6 that tanks are never in use for rabi irrigation, because they are very shallow and dry up at the time when water is wanted; if the tanks were deepened so as to hold more water would the people lift water out for the rabi crops ?—I am efraid not, some of the more energetic night.
- 65. Q. The cost would be more than they are willing to incor ?—Yes.
- 66. Q. You say in paragraph 12 that steam pumps on rivers should be encouraged by Government by imposing reasonable and aniform conditions, is it necessary to impose any conditions at all?—It is a matter in which. Government os general landlord may impose some conditions.

- 67. Q. Woold Covernment have any locus stands in imposing conditions ?—Yes, as propeleter of the water of the
- 65. Q. The Government is not the exclusive owner of the river, is it :- I should say so.
- 69. Q. As regards the Saharmali canal, you don't seem to be very strongly in fartur of it?—No, I would only strongly advocate it in a year when we were very hard up when it might be worth trying.
- 70. Q. Do so s not think it would have any processive value f-I deakt if the value would be commensurate with - the cost.
  - 71. Q. (Mr. Ithetson.)—I gather that you don't agree with the opinion which has been expressed in the papers by some of the witnesses that famine is so may in Uniarat that it is not worth while apending money to stated the Province i—No.
    - 72. Q. When was the last great famine ?-In 1913.
  - 73. Q. How long have you been in Gujarat ?-Thirty 3 Cars.
  - 74 Q. Within that 90 years has there been anything like severe distress or searchly of any sort short of famino?-No, there has never been any need of relief works until the recent faming, there were a few works in the Panel Mahala in one year.
  - 75. Q. Can you tell us suything of the period between 1813 and the time uver which your experience extends; may-thing about the previous 60 years !—I should not like you take my information as exnet, but there have been years of scarcity.
  - 76. Q. Was there no distress in 1877 f-Yes, there was local distress, in the district of Bronch especially; the crops failed locally ewing to attacks of gense-hoppers; it was a terrible year to the Decean but not in Gujaint, and there was local famine about 15 years before that.
  - 77. Q. So that we have had three famines in the country owing to drought in which there has been no need for relief norks in Gujarat ?- Yes.
  - 78. Q. Speaking of the Hathmati canal, there seem to be two complaints
    - (1) the rice beds will not hold water;
  - (2) the supply of manuro is limited; supposing it was possible to substitute rabi for ries, would not that meet both difficulties, rabi requires less water than ries?—I don't think that anything practical is possible. The cultivator would never be induced to believe in it. He would have no culticate in the suppl. of water labling out for the rabi. I thank myself that it might be en advautage
  - 79. Q. In regard to the moral obligation of Government to clear the tanks; we were told resterday that at the revision of Settlement the state of regain, in at ich each tank was, was taken into account and the newspurnt was lowered in consequence, and we understood the negment to be that that this removed the obligation of Government to elear the tanks; do you agree with that !—!!! as regards land which received no water at the time of the terration of settlement.
  - 50. O. If Government now spends moved on these tanks and restores them to their original cardison it might take additional assessment on an open of the isir'y tale additional accessment on an ount of the improvement on the land already assessed !-- It it given a better supply.
  - 81 Q. You have said that if 100 acress are under the tank the first hard to suffer by the insufficient supply is the more distant hard which less its irrigation altegather and that the assessment on the jareduced but not that on the rearr lands. The respection is in the aria irrigated, not so the quality of the supply !-- Yes; the result of clearing it maks would be to water the more destant finds which el will be assessed again, within the time of settlement.
  - \$2. Q. Have you had many applications for a reduction of assess ment on the prounds that the tank is writed repair and the supply of water insufficient F-Applications of that had don't come to me, but es Colle for I remember they mel to come ju.
  - \$3. Q. 140 you think that the number of such tanks tests a relatated projection to the number of tanks which are filled?—A given menter of people don't get water who have to any fir it; they believe that the tanks will be repaired asymmetric transit by obtaining a reduction of any amount to by would surrected their rights

to the water. There is muchler reason, and that is that the Mr. Lity. water rate is included in the consolidated as-essment, and they don't realize that they pay for the water.

- 81 Q. In the case of very small tanks, if Government has decided not to repair them and was perpared to remit the water maximum and it be possible to get the people to keep them?—It would be difficult to get them to comlane.
- 55. Q. Seeing that Government is not prepared to do the work and that the people cannot, would lot all foods he a possible agency. Supposing Government were to allow Local Boards to take the met assessment that may fairly be assessed on the land, and an put them in funds, could not anything be done?—I should not address; they are the worst agency you could have.
- 86. Q. You don't hope much from them, even supposing that the money difficulty is not over?-No. 1 signalized rather to trust to the agency of the people.
- S7. Q. No you think the people might be induced to make small tanks ?—They might, but there would be a dif-ficulty in obtaining land for the tanks.
- 88. Q. Yan my in paragraph & "I am myelf of opinion that as a rule enough is not circlifed to water". Do you know what the system of circlifed to water ". Do you know what the system of circlifed to water are survey question; I don't think it is of much principal account; the sa-essments are consolidated, the separate assessment for water does not appear in village records.
- 89. Q. Is it not important that Government should know exactly what it gains by the tanks?—Yes; I think it is generally underestimated.
- 20. Q What is your opinion based upon !- I understand the general pelneiple is that the heavier the samfall of the country the higher the water-rate; in Konian I believe thoseil rate and water rate ato equal. Here, in Gujarat, where there is less rainfall the mater-rate is considerably less as n rule than the soil rate.
- 91. Q. You think it should bear a larger proportion P-Yrs, the amount credited to the water should correspond name or less to the net produce af irrigated as compared with that of dry lands.
- 92. Q. Your opinion founded upon experience is that that is not the case ?- Yes.
- 93, Q Do you think the error is to the direction of crediting too little to water ?-Yes.
- 34. Q. tMr. Muir-Mackensie.) The scarcity or abandance of rainfall is not a legitimate ground for a higher rate P-Not, if it is fully replaced by artificial watering; it does not matter to a man whether he gets his unter from a tank or the heavens. I would credit as much to the inuka in Ahnadabad as to the heavenly supply in the Konkan
- 95. Q. (Mr. Mbbetson.) Would you extend the number of tanks largety P No. 1 don't think I should, in propering a survey I had in view atterage tanks. I would not unterest the number of progniou tanks
- 96. Q. By irrigation tanks you only refer to noe that holds enough water for rice !-Yes.
- 97. Q. Would you advocate large storage tanks i-Yes, where they are possible.
- 98. Q. Do you think they would payquestion? - They would not east to begin with a not in the tauch Mahala certainly us the people are not accustomed to irrigation, they would soon learn it, there is a great market for rice in the Panch Mahals.
- 99. Q. (The President.)-They might be carried on as Inmino relief works ?- Yes.
- 100. Q. (Mr. 16betcon.)—In Gujarat have they had any appreciable effect on the wells!—Yes.
- tot. Q. Such an effect as to materially iceresse their yield?—Yes.
- 102 Q. Supposing Government were to make a large tank in a tract in which there were tells, sport from the actual irrigation from the tank, would it excreme a material effect upon the prosperity of the tract through the wells?—Certainly; tanks sweeten the brackish water of the wells in Gujarat, and in this way do increase the prosperity of cirtain tracts.
- 102. Q. Would not the tanks be entitled to some credit in consideration of that improvement?—I'm afraid that is would be difficult to estimate the amount; there would be romany s' sites ef effect.
  - 101 Q. It las nesci icen done i-No.

5 Dec. 0t.

Mr. Lely. 5 Dec. 01.

- 105. Q. As to o s, what estimate did you form of their protective value in the late famine; how did they work?

  —As a matter of fact they wore very disappointing; in the cold weather of the famine year they were immensely extended, but the crops were very poor, owing, the people said, to the ground not having been mined upon.
- 106. Q. Their protective value was not very great ?-
- 107. Q. Does their snpply decrease year by year in the cass of prolonged drought?—Yes.
- 108. Q. Were they very disappointing this year?—The rabi erop promises rather well; but as the water-samply in the wells is much shorter, the area will be smaller.
- 109. Q. On the whole they do afferd a substantial amount of protoction?—Yes, especially as regards fodder.
- 110. Q. Apart from the takavi question, have you any suggestions to make us to the means of stimulating the construction of wells by the people?—1 don't know of any means except takavi.
- 111. Q As regards 'the rule of exemption from assessment I am maions to get your views; it is of great importance to know how it works, we have been told that the people thomselves have a certain amount of want of confidence in it; what is your experience, do you think that is so?—No, I should say not; I don't think the whole of the population thoroughly understands the intentions of Government, but they are gradually learning to understand.
- 112. Q. Would a cultivator who had made o well and whose rate was onlineed on account of n rise in prices realize that the enhancement was not due to the well?—Yes, I think so; his neighbour who had not made a well would also have his rate enhanced.
- 113. Q. Do you think that as a rule Government does arrive at the one object of exemption—the stimulation of private enterprise?—Yes.
- 114. Q. How long has this policy been at work?—It was legally estublished on the revision of the Code in 1886, I think.
- 115. Q. (Alr. Afair-Mackenzie.)—Was it not working before that ?—It was then unde plain in chapter and verse; I should be inclined to date it from 1886.
- 116. Q (Mr. Ibbetson.)—Do you think the people's knowledge of the principle might date from 1886?—Yes.
- 117. Q. Do you think the number of wells has increased much more rapidly since 1886, apart from famino years?—I cannot say one way or the other, in any ease 15 years is a short time.
- 118 Q. Can you tell us any facts in support of your statement regarding the stimulation of private enterprise owing to exemption?—I cannot say. I have no statistics.
- 119. Q As regards the effect on the ordinary rayat, do you think that he would make a well on promise of promaneat exemption, when he would not make a well on promise of exemption for 30 or 40 years?—I think it would make a great deal of difference.
- [Mr. Muir-Mackenzie rend out figures relating to wells in Gujarat and atated that from 1886-87 to 1896-97 there had been a very small increase.]
- there had been a very small increase. I

  120. Q. Now in regard to the question of recommending oertain leniencies and liberalities in order to stimulate the construction of wells, such as the reduction of interest on lone and remission of advances seme of which you yoursolf suggest, the cost of these must of course como out of the public purse. In Northern India we can recommend them on the ground that although for a time Government will lose money, still if extra wells are made after a period of exemption there will be a financial return in the shape of enhancement of direct revense; in Bombay where the exemption is permanent there is no such prospect; whatever is given is lost for ever; and except as regards the general prosperity of the country there is no financial return?—No, there is a considerable return to the raynt, though not to Government.
- 121. Q. If you make the rayat a present of the interest on a lean of Rs. 1,000, you take it out of the packets of the people of the rest of India. What I wish to point out is that in one case you get a return but not in the other, and that where the exemption is permanent it becomes more difficult to support the measures of leniency which you recommend. Take a province in which the term of exemption is limited, say, to 30 or 40 years; would you have the exemption permanent or would you grant the more favourable terms as regards interest and remissions; which concession do you

- think would have the greater effect in stimulating private enterprise?—Why not both?
- 122. Q. If you could get both, the quostion is in which way we should he more likely to stimulate private enterprise in each a province; whether by the proposed measures of Isniensy or by changing the 30 or 40 years exemption into a permanent exemption?—It would depend much on the view of the individuel landholder. We might give him the choice hotween making his well with aid from Government liherally given with exemptions for a limited term, and making it without aid from Government with permanent exemption.
- 123. Q. Do you think a reduction from 5 to 3 per cent. interest on teknyi would actually induce n rayat to make wells!—I think it would be a strong inducement.
- 124. Q. Would it induce him to make wells when he would not ordinarily make them ?—Yes.
- 125. Q. Your well protects (not vory effectually) 2 to 4 acres in one year of drought ent of 30, is it worth the while of Government to parchase that amount of protection by remitting the interest on fakavi leans for wells?—The protection in a famins year does not represent the total benefit by nny means.
- 126. Q. You think it would be worth while on the whole?—Yes.
- 127. Q. You say in Gajarat a bania will lend money for wells at 6 per cent.?—Yes, to a good substantial rayat.
- 128. Q. (Mr. Muir-Mackenzie.)—Would he do it in any district?—It would he done in Sarnt. I don't doubt it would be done in Breach; I am speeking of pre-famine yenrs; the security here is more valuable than in the Decenn.
- 129. Q. It is not restricted to the patadars?—It is restricted to n man of repute in the village.
- 130. Q. To large land-holders ?-Not necessarily, it would depend upon the character of the man.
- 131. Q. Would a man holding not more than 10 acres have any chanos?—If he is otherwise a man of trust there whald be no difficulty in his getting it; sometimes a bania goes shares in the well.
- 132. Q. (Mr. Ibbetson.)—You recommend recovery of loans by 20 instalments; it has been proposed in some quarters to allow 50 ?—I think that would be too much.
- 183. Q. Would not the risk of the well failing, or turning salt or falling in be a substantial danger to Guvernmeet if it increased the number of annual instalments to 50; the longer the period of payment, the greater the risks?—I don't think it would be worth while to prolong the agony beyond 20 years.
- 134. Q. You lay considerable atress apon the rigidity of recovery, do year rules allow the postponement of instalments?—Yes.
- 135. Q. Are the rules noted upon?—Yes, it mainly dopends upon the good word of the village accountant.
- 136. Q. Can you saggest any way in which this rigidity coold be tampered?—Nothing, except by making the instalments so small that they would not be felt.
- 137. Q. We find complaints that the dolay in granting takevi caused by enquiries as to solvency, etc., is one of the serious objections of our system; are such enquiries necessary seeing that by law the loan is the first charge npen the land?—Yes, I think they are; Government cortainly have the right to supersede the banta, hat I doubt it would be vise or just.
- 138. Q. Yon say that you hesitate to recommend a remission where the well falls in ; supposing we only gave remissions where e well was constructed on a site approved by Government?—I don't think that would work.
- 139. Q Supposing that we had approved of a site after a trial boring and that the well failed?—Then thore would be good reasons for giving a remission, but I thiak that would be extremely rare.
- 140 Q. There is mother suggestion that Government might only remit a portion of the advances !—I should object to that, as there would be a question of how much it should be.
- 141. Q. Does the absence of any tonanoy right preveot tenants from making bunds, etc.? The tenants don't lay out money on the land.
- 142. Q. Would not the old owners do it 1-If they are protected they do sometimes.
- 148. Q. You don't think that the absence of protection operates so as to restrict extension?—No.

& Dec. DL.

- 144. Q. (Mr. Rajaraina Milr.)—In teplr in a question by Mr. libeton, you sail that there was in the case of most of the tanks a surrender of assessment at the revised settlement and consequently the moral pullcation on the part of Boreroment to keep up these tanks has been removed or lesceed; so far as regards those lands which are still the second of the assessed as wet, is use reduction made in case the tank fails: -- Upon application of the huller enquiry is made and it the tank is found to have failed the assessment is proportionately reduced.
- 145. Q. What amount has been spent on the repair of tanks during the post 16 or 20 years?—I cannot tell you.
- 145. Q. The number of wells in your division has not very largely increased ?-No. I believe not.
  - 147. Q. Might it be due to the present complicated system of inquiry regarding loans?—It might be due to some extent to the complexities of the system, marvoidably so, as we must be sure of some security. I don't see why there at call to any undue delay at all; we are now beginning a rew special regard to takent for which there was no denered before the familie; we ought to see a new development during tho next few years; the system seems to be as simple as it can very well be made; a man asks for money, you make a reference to the village officers and if the country is attlefactory be gets it. if the enquire is actisfactory he gets it.
  - 149. Q. Huw lung does it take ?-It need nut take a month; sometimes it is the man's own fault; people have a light of going the last day and expecting the whole thing to he done in 24 hours.
- 149. Q. You said you are not in favour of granting remission of takari; if special cases are enquired into by Divisional officer would you still refuse to grant a remission if he is satisfied that there has been no fraud and that the rayat honestly spent the maney?—I have a horror of special cases myself.
- 159. Q. Do you think the Collector coold make the enquiry ?—The Collector is a very hard worked m.m. cases for special treatment would be very frequent once that was lail down.
- 151. Q. At the end of paragraph 18 you say " these conditions are often ubsent." You don't refer to ony difficulties in takavi?—No.
- 112. Q. With reference to what you say in paragraph 15 is there at present anothing to prevent an other earrying the money and paying it on the spat?—It is not a desirable thing to entry large sums of muney about on account of the fear of theft.
- 153 Q. Is there anything in the present rules to prevent an officer doing sof-ho, except that there would be account difficulties. I don't say they cannot be overcume.
- 151 Q Have there has many eases in which takars, at a portion of it, has been remitted owing to failure of wells? Nut that I am aware of.
  - 155. Q. You say in paragraph 20:" the number of wells already in the country that lie enused is remarkable": are there any statistics to show the number of wells unused?—I am not aware if there are any.
  - 156. Q (Mr. Mair-Mackenzie)—Is there any reason to behere that the water-longing which has been observed in certain area in a been proceeding more rapidly in recent years?—That is my impression. I cannot give any very definite grounds for it.
  - 157. Q. In your long experience of Gujerat do you know whether there has been a large extension of unter-log ring f-Yes, we have heard a great deal more of it in terent years, especially in the Mutar Taluka.
  - 158. Q. You attribute that to the silting up of the sire-si-Yes, chiefly the Sabaranati; it has become very much silted up during the part liftern years.
  - 159. Q. I understand from your memo, on the Aukleshvar report that non-fear the silt would beat all efforts to drain it?—Yes.
  - 160. Q. But do you think that the desire which have been no led have not even temperatily mitigated the will. I have no d will they have temperatily mitigated the evol.
  - 161. Q. Are you able to say whether it would be a long time lefter the effect of the drains would be neutralized?-It would be some time but not very long.
  - 102. Q. Hare you seen ray of these lands in which surface rolls have be a injured by drains i-No, I have beard of them.

- 163. Q. You cannot say whether the injury extends over Mr Lely. a large portion or the whole of the drain f-I cannot
- 104. Q. Du you consider that the rayate are likely to take up con-bletable sums as advances on their joint responsibilite for the purpose of digging tanks ur improving old tanks?—No. I have never seen any signs of it.
- 165. Q. You don't think the people are good judges as to sites of tank-?-Xo.
- 166. Q. Would they make greater mistakes than as regards wells i-They would be much less excusable mistakes.
- 167. Q. I thought you said they were good judges as regard wells?—Yes, they are good judges, but not as good in the matter of tanks
- 16S. Q. You say in paragraph 3 "the people would certainly not take comal mater in the black soil country between the Tapti and the Mahi rivers or in the west of the Ahmadahad district. It would also be superfluous in land so retentive of maintage." Would it be superfluous in a year of drought ?—No; in such a year as this it would be anperficous.
- 160. Q. What about 1820 f Of course that was different; it would be superfluous this year when the cotton would have done excellently had it not been fur rats.
- 170. Q. Would it not pay to substitute rice for cotton cultivation?—I don't think you would gain anything by that.
- 171. Q. Desarice not pay better than cotton? —It may; but I don't think you would gain anything by substituting rice for cotton, they are both valuable crops.
- 172. Q. On the other hand there would be this advantage that cand water would be available in a year of extreme drought without any loss to the people?—Yes, no doubt the question is whether it would be a gain to Guyermoent in urdinary years.
- 173. Q. If rice is more valuable ?-It is fully as valua-
- 174. Q. It might pay a moderate rate f.—In an arrange year rice is grown un the understanding that there will be enough rain to mature it.
- 175. Q. Still, tanks are a good prefection f—Tanks are chiefly intended for years in which the rains fail, but I don't think the rayat would pay Rs. 7 for a last watering; it is a question I have discussed with men who ought to know what the rayat would be willing to pay for extra water from the canal. Some say he would take water from the canal in any case. I should not have thought so myself.
- 176. Q It is admitted that salt water is useful for certain crops, such us barley ?-Yes.
- 177. Q. It was said yesterday that in certain barley tracts it might be dangerous to sweeten wells ?—I abould not be luclined to go so far.
- 178. Q. You say in paragraph 6 speaking of irrigation tanks " their necessity is based un the fact that in probably 3 years out of 6 the early rainfall antheen for sowing, bany 3 years out of 5 the early familial sumes 1 or souring transplanting and bringing the rice plants forward, but fails at the last when water is needed to mature them." Is it to be inferred from this statement that in 3 years out of 5 free is un utter failure?—Perhaps 2 years out of 5 would be safer; in 2 years out of 5 rice crops not protected by tanks are a failure.
- 170. Q. Rao Bahadur Ithimbhai has estimated the area anprotected at two-thirds and that failsf—Yes, perhaps if a rayat could secure a good crop in 3 years out of 5 is would be enough for him.
- 18). Q. With regard to the repairs of tanks you would be glad to see this 10 per cent, contribution altogether abolished P-Yes.
- abolished P-Yes.

  181. Q. In a Memo. I base obtained from the Public Works bepartment I find that in this Division there are estimated to be 1,178 tanks requiring repair, the cost is estimated at Rs. 5,20,000, and a suggestion is before the Gevernment that these reprints should be excented systematically throughout the period of 20 years; would that sait the case or would ven prefer that the period should be materially stortened P-1 should prefer 20 years; I understand that the tanks sait up in that time.
- 182. Q Now that it has been definitely ascertained that three 1,178 tanks require repair, would it not be advisable by a spinion to concentrate famine labour upon these tanks?—Yes, that has always been in my much.
- 183. Q. (Mr. Illerson)—Is the sum of Rs. 5,25,020 are and or spread over 29 years?

Mr. Lely.
5 Dec. 01.

Mr. Muir-Mackenzic .- That is the total amount.

Witness.—I believe the reason why more has not been done is becouse they are small works and there is a general objection to small works?

184. Q. (Mr. Muir-Mackenzie)—The fact of their being small works would not make it impossible to take them up as works of famine administration?—It would certainly be more difficult but not impossible.

185. Q. Would it require much revision of the existing programme?—No, in the programme a number of works are clubbed together.

186. Q. With reference to what you say in paragraph 8 the whole question of remission of land revenue is under the consideration of Government, is it not?—Yes.

187. Q. Up to the last cycle of bad years do you think the people have found serious difficulty in paying their rice assessment?—It must have goue very herd with a man wha lost the whole of his crops.

188. Q. Has there been any difficulty in getting it out uf them P-No, his land is too valuable to risk and he could always raise the assessment from the Soucar.

could always roise the assessment from the Sorear.

189. Q. With regard to what you say in paragraph 18 about wells, your general view is that only a substantial man will come forward and execute works likely to pay, but does not the general argument you have used militate against the giving of water cheap by Goverament, at least by the large system of canals as in Northern Indio?—As I understand, the canal water is loid on the ground by natural flow almost invariably, the canal rate would not be much more than the equivalent of the labour of lifting water thus saved—in the case of a well the cultivator has to inear heavy expenses, quite apart from the cost of sinking, that is, bullocks and labour.

190. Q. I understand that you prefer the system under which the cultivator will get his water dear ?—I look upon

that as a check against injudicious irrigation to which attach the greatest importance.

191. Q. Supposing the advantage to the land from the water to be equal, would you profer to see land in Gujerat irrigated by wells rather than by canols?—In Gujarat certainly.

102. Q. I believe you strongly approve of the grant of takavi liberally in the early stages of famine for kachcha

193. Q. Would the end of October be too early if min has failed by the end of September?—No.

194. Q. Do you think the people will again become backward in taking takari when good years roturn?—I cannot sny; the low rate of interest charged by the bana may be an obstacle; that is one argument for lowering our rate.

195. Q. You have suggested that Government should take precantions to find out whether, by horing, a well is likely to succeed; would the data collected by the Survey Department he of coasiderable use?—They might be of some general use, but being on the spot is the only thing.

196. Q. Would drainage in your opinion be an effective remedy for salt effloresence or deterioration coused by over irrigation?—I think that is the generally accepted view, I know nothing about it myself.

197. Q. You said a bania often supplies the capital for a well and taken a share of the produce; would it not be advantageous for Government to supply the capital for the well and take instead the bagayal assessment?—I don't see m'ry that should not be done.

193. Q. You have no objection to ecciog it uffered ?-No.

199. Q. You don't think it would create mistrust, as engendering the idea of cuhauced assessment?—Not if properly managed.

## WITNESS No. 21-ME. FARDUNJI CONVERJI TARAPURYALA, C.I.E., B.A., L.C.E.

## I .- Answers to Printed questions.

Mr. Tarapur-

## A .- GENERAL.

Question 1. The answers below refer to the Ahmadabad District in which I have sorved off and on for a poriod of 14 years. They also cover the Khari Slaices District in Matar Taluka of Ksira Collectorate, the Khari Slaices being under the Excentive Engineer, Abmadabad District.

No. 2. The average of the minfalls registered at Ahmodahad for the lost 20 years during each month is as follows:—

01107	Lill town					
	January			•		Inches. 0.04
•	Fobrary		•			0.09
	March	•		•		0.00
	April .	•				0 03
	May .					0.27
	Juns .				•	4.59
	July .					12.61
	Augost		•			670
	September					4.48
	October					0.38
	Novomber					0 29
	December					0.07
No.	3 (1).—No. 3 (2).—No. 3 (4).—No.					

. No. 3. (5).—Yes, as regards the Khari Cut Cannl, the Kharl Sluices and the tanks. The obstacle does not exist in the case of wells in average years.

No. 6.--No.

Soveral potitions have been received during the last few years from the people of South Daskrei for the extension of the Khari Cut in Ahmadabad Collectorate and also from the people of ex-kalambandi villages in Motar Taluka of Kaira Collectorate for supply of water from the Khari. Petitions have also been received from Dholka Villages for

n caual from the Sábarmati. In several cases the petitioners have offered a free gift of land required for the canal.

## B .- CANAL OF CONTINUOUS FLOW.

The Hathmati Canal and Khari Sluices fall under this head.

No. 7.—It is difficult to answer this question definitely, but roughly speaking irrigation may be said to increase the value of the produce of the land by 40 to 100 per cent. In average years from one or other of the causes enumerated in the question. In years of severe drought such as 1899 and 1901, when the supply in the canals almost completely fails, very little or no irrigation is possible.

No. 9. The water charges per acre on the Hathmati Canal are as follows:—

a rollows:	•							
Crops.						Re	te per	2076
Rieo	•	•	•	•	•	•	3	
Rabi	•						2	
Peronnial	1						10	

The water rate on this eanel is charged on the area actually irrigated.

No. 11. None to speak of. The Hathmati Canal is of 25 years' standing, and the Khari Sluices have been in operation from time immemorial. On the latter system the area of khar land is about 10 per cent. of the area irrigated and is not perceptibly increasing. On the Hathmati practicelly no land bes turned salt by irrigation.

## C .- CANAL OF INTERMITTENT FLOW.

No. 12. The Khari Cnt is the only work falling under this head.

(1) It has got three sources of supply, viz .:-

(a) The surplus water of Khari River after satisfying the requirements of the Khari Sluices District which has, by the sottlement, prior claim on the Khari River water. The surplus water is turned into the Khari Cut at Raipur by means uf a weir with revolving sluices.

- (b) The water from the catchment of the Chandels tank which is the principal reservoir of the Khari Cut.
- (c) The surplus water of the Hathmati Canal which is surplan water of the Haitman Canal when is brough the down to the Khari through the Blujwa Channel taking off at the 5th mile of the Haitman! Canal. The Bunjwa Channel has been recentic constructed and has as yet been little arailed of nwing to the scanty supply of the last three years.
- (2) The maters from the three sources above named are stored in the Chandola Tank and thence distributed by changels to the lands as required.
- (3) July to October in years of omple or scanty minfall; re is hardly any supply in years of drought such as 1800 ther and 1901.
- · No. 13. 17de answer to question No. 7.

No. 14. The value of irrigation is not much affected by the too late commencement or too early occasion of the supply, if the supply in September and October in which water is most required is ample. If the supply in these months fails, the value of irrigation is diminished in proportion to the deficiency.

No. 16. The irrigation is supplemented by well water in case of inte communement of rain and na supply in the referroir for rice seedlings. Well water is the need to a small extent for the last one or two waterings to him price crop to majurity if there is neither late rain nor sufficient supply in the reservoir. Rice is notor grown by well-irrigation clone; the cost is prohibitive.

No. 17. The water rates on the Khari Cui Canals are as follows :-

> . 7 per acre. Rharif (rice) . δ

ltabi . In ease of land already assessed for water advantages at the settlement, the fixed water assessment is deduced from the above canal rate for hisrif. The canal rate is invariably charged on the area setucity irrigated, and remissions are given in case of failure of crops due to deficiency of canal water.

No. 10 Secondary to constitute Value.

No. 19. See answer to question No. 11.

I have no experience of draining irrigated lond.

No. 20. Maintenance is provided for from Imperial Fande. The average annual cost of maintenance per acre irrigated for the last ten years is about Re. 268. The system works lairly well and no further legislation scens to be required.

No. 21. None that I know of.

No. 22 'I do not consider it advisable to have canals made by private persons. There is hardly any scope for them in this district.

## D .- TINES.

No 23. (1)—Tanks is the Ahmsdahad District are mostly supplied with water from their own-extendents. A few are supplied by the spill from the upper tanks, while a few others no supplied with water feam drainage

- (2) The distribution of water is arranged by the cultiauthorities.
  - (3) July to October.
  - (1) From o few acres to nearly 500 acres.

There are in all 1,256 tanks, small and large, irrigating 26,600 acres, which gives an average of nearly 21 neres

No. 21. Please see answer to quality No. 7.

No 25 Not much it there is ample supply in the tank in September and October. The crop irritated an tanks is invariably need the finer varieties of which can be sown late without much harm, but which must have a copieus supply of water in September and October to bring it to materity.

No. 26. See reply to question No. 15.

No. 28. The water rate was fired at the settlement and is paid on the whole area assessed without reference to the area actually irrigated.

No. 20. The mainterance is provided for from Im-terial Funce, the repairs being carried out by the Public

Works Department. The total amount spent in repairs doring the last ten years, exclusive of famine expenditore, who is 25,618 against the total accessed axes of all the tanks of 20,600 axes, which gives a rate of about 11 annus per acce per anama. A much larger amount can, however, he spent account on repairs. The system is monaged by the literence Department entirely except as regards repairs.

the Revenue Department entirely except as regards repairs.

No. 31. Saltian up of lanks is remorkably slow. There are numerous lanks which have not been theared for 60 person and apparely, and they are still in fair working order. Silt from tanks is to some extent removed by private people for manuring their fields. No duslinging is required as the tanks one generally dry in the hot reason. The repairs carried out to these tanks consist of strengthening and repairing the bonds rather than eleving the beds. Some of the large tanks were elevated during the last famine when the depth of silt was not found to be very great.

II .- Report on the points to be considered by the Irrigation Commission.

Norn-Questions which have already been answered above baro been omitted in the following replies.

Point No. 2.—The following areas are protected by Government Irrigation works:—

			Acres.
Hathmoti Canal	•		8,000
Khari Cut .			3,000
Khari Sluices (Kair	a Distr	ict)	8,900
Tanka			26,600

As a rule rica cultivation is not possible without artificial irrigation to more or less extent.

There is ordinarily a demand for water for rice cultiva-tion during south-west monsoon and also for sugarcano in long breaks.

The principal crops requiring irrigation are shown below :-

Ctop.	Period.	No. of watering.
Rice .	July to October	B after trans- plantation in case no
Wheat .	. November to Janu	nary 7
Barley .	. , ,	, 7
Sugarcano	. May in March	. 60
Juari .	. March to May	. 5
(Hot seaso	n.)	1

The distribution on the canals is controlled by the Public The distribution on the canals is controlled by the Public Works Department and on the lanks by the cultivators themselves, subject to the geoemicontrol of the Revenue notheratives. The programment on the Hathardt and Khari Gut Canals is realized in the shape of a water rate per acro of the area neurally irrigated, remissions being given in care of fadure due to insufficient supply in the canal. On the Khari Sluices and the tanks the irrigation rate is assimilated with the land revenue and recovered in lamp for the whole area assessed without reference to area actually irrigated. actually irrigated.

No. 3. The black sail in this district is light. Small tanks constructed in these solts hold water. There are no high earthen dams constructed, but I should say dams up to 15 feet in height can safely be constructed without n masons core. For rice, which is almost the only crop requiring principal daming the south-west moneson, that o is demand for water daring seasons of average rainfall as well as in case of prolonged drought. In this respect there is no appreciable difference between rice grown on black and that on other soils. They both require water in the latter part of the more consensuable to write on the part of owners of rice lands quality whether the call is black or gonados. A nomber of applications with an offer to pive land free of cost in some caves have been received during the last few cars from cultivators in Bankrol and Maint Tainkas for the catterion of irrigation to their villages. No. 3. The black sail in this district is light. Small the extension of irrigation to their villages.

Mr. Tara.

Mr. Tarapurvala.
5 Dec. 01.

No. 4. This question will be fully answered by the Superintending Engineer on special duty. I have at some length expressed my views in regard to the proposed Sabarmati Canal in my report No. 4013, dated 16th July 1901, submitted to Government when I was noting Superintending Engineer, N. D.

No. 5. There are in this district no Provincial Irrigation works, i.e., works constructed or maintained from Provincial Fund.

No. 6. District or village works.—Those are irrigation tanks or bunds constructed in old times. Their total number is 1,286, small and large. They are controlled by the Rossano Department, except as regards repairs which are carried out by the Public Works Department. The total area assessed on these tanks is 26,600 acros. Government in their Resolution No. 34-W.I.—419, dated 5th March 1895, have admitted their responsibility to maintain these tanks, but the matter is still under consideration, as it is proposed to absult on the tanks as are too small or on which the water-reverue is too insignificant to make it worth while to maintain them. The average annual maintenance expenditure on these tanks during the last ten years, excluding expenditure on relief works, was Rs. 2,564. No new works of this class have been constructed of late years. Such works are not undertaken by the Listrict Board or private landowners. I do not think it desirable or expedient that Local Fruds should be expended on such works. The protective value of these works can certainly be increased by deveting more money and greater attention to their up-keep and by encouraging the construction of new bunds where feasible. Those works are generally of great value as concerning village water supplies for men and cattle and supplying the wells in the neighbourhood and keeping them sweet.

No 7. So far as I know the deep-st borings ever made in this district were the two carried out in Virangam Town some 14 years ago. They were about a hundred feet deep, but the sopply tapped was meagre, and the water not very pure. Arrang-ments are now being made to make one or two borings in Virangam Taluka 200' deep, and the result of these will be anxiously awaited. Shallow beings in wells have been found in a few places to increase the supply, but moto experiments are necessary before a definite opinion can be expressed on the point. The heavy cost of boring and uncertainty of success are a great deterrent to private owners resorting to them to any appreciable extent.

No. 8. Land was being injured by water-logging in Viramgam Talaka, bot that has lately been remedied by the construction of several drainage channels during the last famine. Similarly water-logging in Sanand Taluka has been, to some extont, remedied by the completion of the Narsingpura and Ogan Brains and the partial completion of this Godhavi Gorai Drain. The last work requires to be completed. A new drain from Chekla southwards is also necessary. In Dholka Taluka there is considerable water-logging near Bag dra for which a drain has been sanctioned by Government. The drains in Sanand and Dholka Talukas are proposed to be carried out during the present scarcity if required as famine relief works. The drains ere constructed from Imperial Funds. The drains would result in increase of revenue by embiling relinquished lands to be gradually taken up again and preventing further relinquishment of land. The drains should, however, be ntilized, as far as possible, for filling tanks. Sorveys for this have lately been carried out.

No. 9. The following table gives the required information:

Statement of works carried out by famine labour in 1899-1900 in the Ahmadabad District.

Classification.	No. of works.	Total famine expenditure.		
				Rs.
Railway			1	1,54,528
Collecting road motal .			6	1,75,869
Canal exeavation			2	2,03,278
Drainage channels .			6	8,01,464
Deepening irrigation tauks			32	10,93,830
Deepening Local Fund tanks	1		80	9,42,760

It is desirable to complete as a charge against Imperial Revenues the following works uncompleted at the end of the famine:—

### 1. Khari Cut Extension-

The main channels have been completed, but the branches and distributation as well as nil masoury works remain to be carried out. This scheme, when completed, is estimated to irrigate some 12,000 acres of rice land as against 3,000 acres now irrigated. The cost of the remaining works, including the Bokh Reservoir which is necessary for securing the required supply, will be about 3 lakls. The marmal cost of the channel completed by famine labour is lls. 1,07,446.

## 2, Godhavi Goraj Channel-

More than two-thirds of this channel remains to be completed. Until the channel is completed it will be more or less oscless, and the antioipated benefit to the water-logged lands will be delayed.

The deepening of the first ten miles of the Hathmati Canal has resulted in materially increasing its discharge and preventing the growth of weeds. Last year it enabled a large quantity of water to be sont down via the Bhojwa Channel to the Chandela Reservoir of the Khari Cut. The results of completed village tanks are not yet fully apparent as the rainfall both last year and this has been scanty. Last year, however, the run-off was somewhat better and several of the tanks filled and held water.

No. 10. This district cannot be said to be ordinarily liable to famine, still a programms of works sufficient to give employment to 183,000 people for three months is ready. In addition to these n number of small village works are being surveyed and kept roady in case of necessity.

- 1. Q. (The President) You are Executive Engineer of the Ahmadabad District ?-Yes.
- 2. Q. How long have you held that office ?-For foar years.
- 3. Q. Before that where were you?—I have been serving in this District off and on for about 14 years. Before I took over charge of this district, I was Acting Soperintending Engineer, Northern Division, for about seven months.
  - 4. Q Then you know this district intimately !-Yes.
- 5. Q. You have a great deal to do with the Hathmati
- 6. Q. It is generally pronounced to be a failure from a commercial point of visw?—Yes.
- 7. Q. From the figures furnished by Mr. Reale it appears that the annual cost of irrigation by the Hathmati Canal was Rs. 198 per sore while the actual return was

- Rs. 2-34 P-In the first few years we found that there was no return at all.
- 8. Q. Why?—Irrigation was not sufficiently appreciated by the people, but gradually they began to take the water. For the first 13 or 13 years the return was very small; it did not pay the working expenses. Again, the canal was made in a tract not fit for rice cultivation, which was a great mistake.
  - 9. Q. It was made 25 years ago f-Yes.
- 10. Q. I think it was one of those projects which are marked "important" more on ongineering than on agricultural grounds ?—Yes.
- 11. Q. You have taken measures lately to regrade the bed of the canal?—Yes.
- 12. Q. With what results?—The result has been that during the last year, when there was a flood in the river, the relocity was much increased and the former drawbacks greatly remedied,

- 13. Q. There is less percolation and less loss i-Yes, and there is a larger discharge.
- 14 Q. It runs more quickly ?—Tre; owing to the slow relocity there was trouble from silt and growth of weeds.
- 15. Q. If as that reduced percolation i-Tes; scooring is now noticed in one or two places.
- 16. Q. Yoo say in your mrmo." the orea of Khar land is about 10 per cent. of the area irrigated and is not perceptibly increasing "f—That refers to the salt landon the Khari Cut Canal.
- 17. Q. On the Hathmati you say there is no sait laud?—No laud has turned sait under the Hathmati.
- 18. Q. There is a proposal for a large storage of water for the Hathmati Canalf-Yes; I have had nothing to do with that project.
- 19. Q. There has also been o project for the Bokh reservoirf Yes.
- 20. Q. The Bhujwa channel was an alternative scheme?

  Yes; at first it was proposed to make a considerably higher dam across the Bokh and make the reservoir much bigger; subsequently it was proposed to divert the surplus water of the Hathmati through this Bhujwa channel into the Khari of a small cost. It has cost about Rs. 7,000.
- 21. Q. How much water do you think will be got in that way?—In normal years we expect the discharge to be 60 cubic first throughout the kharif season.
- 22. Q. You trought forward this scheme for the Bokh in addition to the other schemes?—Yes.
- 23. Q. Your seheme provides for a 85 feet high dam across the river?—Yes.
  - 21. Q. You cut down the former project ? Yes.
- 25. Q. Because less water was available?—In the former project it was proposed to feed the reservoir from the Hathmati Canal, we have now taken water from the Hathmati Canal through the Bhujwa Channel.
- 26. Q. On what du you hase your calculation of slorage, on the mean or the maximum rainfall f. Upon the mean rainfall of the year and we take n certain run off. In this ese the rou off is ith of the salnfall.
- 27. Q. (Mr. Higham)-You mean average rainfall?-
- 28. Q. (The President)—Suppose you went upon the maximum minfall, would you get too much water?—That deprads upon the intensity of rainfall; you might get 10 inches nf rain in one day and get too much water, or might have 10 inches distributed over two days and it might do no harm.
- 29. Q. You think there would be dauger of damage by floods?—No; but it is not worth making a costly scheme on the chante of a rainfall which may only occur once in tru years.
- 30. Q. Have 500 got the Khori project complete?—We have completed the earthwork only. It was sanctimed during the last famine. I nm speaking of the Khari Cut extension.
- 31. Q. You say waters from three sources are stored in the Chandola tank; what are the three sources?—The first source is the catchment of the Chandola tank itself; it comes from a long distance; the second source is too Khari Cut; and the third is the surples water of the Hathmati.
- 32. Q. Is the Chandels tank large enough to hold this water? It has been increased tils former capacity was about 60 millions cubic feet, it has now been increased to Blutt 100 millions cubic fect.
- 33. Q. Is that sufficient?—Yes, as a distributing re-error; for a hig system it is too small a reservolr; it will refill from time to time throughout the kbarif season and the water could be distributed as required.
- 3t. Q. Roughly speaking what is your estimate for there extensions?—If carried out as a famine work the expenditure would be a lakh-and-a-half of rupee. Normally the expenditure should not be more than a lakh of rances.
- 25. Q. Including masonry works?—No, not masonry; the masonry works and distributories will contained two or two-auto-abeli lable more.
- no Q Yen say here "tarks in the Ahmsdabad District are meetly sepplied with scater from their own catchments." Did yen get funds to repair the cluices or clear out eilt from any of these tarks?—Yes.

- St. Q. How much did you get !- About Ba. 10,000 a Mr Part. year during the last nine or ten years.
- SS. Q. That does not go very tar?—No; and even that was not spent; the budget is sanctioned in the month of June, and in June the time for repairing the tanks is past and gone; the proper time to repairing the tanks is part and gone; the proper time to repair these tanks is from April to June. We should get permission to start works in anticipation of the budget sanction.
- 39. Q. If it could be arranged to get permission for the Poblic Works Department to start works in autheipation of the bodget grant it would be possible to spend a larger amount?—Yes.
- 40. Q. (Mr. Hoham)—The budget is not sanctioned fill Juno?—Not generally; another cause of the lapse of funds is that a aufficient number of plans and estimates ore not kept ready. I think it would be desirable to have a large number of plans and estimates ready on hand.
- 41. Q. I suppose you have not got establishments to enable you to do that?—It would not be difficult to provide for establishments if it was once taken in hand seriously. for establishments if it was once taken in hand seriously. Then, a great deal of time is lost in ascertaining if the people are willing to pay the 10 per cent rontribution. The general impression is tast according to Government orders the contribution ought to be taken from the people before any tank is taken in hand. Government have left it to the discretion of the Collector to remit this 10 per cent, contribution; still, as a matter of fact, a great deal of time is lost in making inquiries whether the people of a particular village are willing to contribute. Taking all these things into consideration it is not possible to expend the full grant. the full grant.
- [Mr. Muir-Mackenzic.—The question of abolishing the contribution is under consideration.]
- 42. Q. (The President)—How much of the Rs. 10,000, do you spend?—About half. I have got the oxact figures of the last seven or eight years which show that we have been able to spend about Rs. 30,000 on these tanks.
- 43. Q. (Mr. Ibbetson)—In paragraph 80 you say that in ten years there has been an expenditure of Rs. 25,618 ou tauks P—Yes.
- 41. Q. Then f suppose you have repaired a great many of the tanks? Not a great many.
- 45. Q. What was the largest amount spent in any one year?—I cannot say.
- 46. Q. It is proposed to spend some five laklis of rupces in 30 years? Yea; on all the tanks.
- 47. Q. Are there ony tanks which are not in n rninous condition! Very few of thom are in a ruinous state and past repair.
- 49. Q (The President)-The figures in your memorandom are a rough forecast? -Yes, we may have taken so many rupees per tank.
- 49. Q By repairing the tanks will the area of irrigation under them be much increased f-I do not think so; it will be made more secore.
- 50. Q. A number of old tanks will be supplied under the Khari system. The idea is to use up all the water?—Yes.
- 51. Q. You say none will be wasted?—In big floods some of it will be was'ed.
- 52. Q. I notice that for the Salarmeti Canal a cut of 40 feet is proposed?-First it Is 40 feet; and thou it is about 20 feet.
- 53. Q The deep cutting is only in the first mile?-Yes. 51. Q. You propose to build n weir neroes the Sabar-nati?—Yes.
- 65. Q. Would you have a permanent bar aeross the ver?-Yes.
- 56. Q How high !- It will be five feet bigher than the cummer water level. The project was prepared in 1875, but
- 57. Q Supposing von made it ten feet would it be dangerous?—Yes; because the foundation is sandy; there is no rock; we have got clay below the sand.
- 58. Q. West volume of water will be held up by the weir?-I do not know,
- 59. Q. Hare you had levels taken?—The fall in the river is not more than a foot and a half per mile and the beight is not more than als or seven feet; we cannot store much water. The flow in the river is considerable.
- CO. Q Would it be worth storing water if you can up gates? That may be done in the cold weather if y put revolving gute.

5 Dec 01

Mr. Tara-5 Dec. 01.

- Mr. Tara- 61. Q. Hos that been thought of P-I have been think-puravala. ing of it; I wes not called apon to submit o written report on this point.
  - 62. Q. What stogo has that project reached?-It is hofore Government.
  - 63. Q. You say the cost will be about Rs. 18,60,000 ?-Yes.
  - 64. Q. You say 23 per cent. for establishment charges ?— That is not the netual establishment required; but a certain percentage fixed by Government; it includes establishment of oll kinds. It is simply a nominal figure.
  - 65. Q. How far does the canol from the Sabarmati go ?-It is 27 miles long ond goes as far as Dholka.
  - 66. Q Does it supply any tonks?-Yes; the whole place is full of taoks.
  - 67. Q. To go back to the question of irrigation tanks, you say they irrigate 26,600 cores; where did you get these figures from?—They are the result of inquiries made by the Poblic Works Department in 1894. A subordinate was sent round to the villages and he got the figures from the village books.
  - 68. Q. Your reply to question No. 8 relates to water logging in the Viramgam Inluka; have you heard any complaints against the draius made there?—No.
  - 63. Q. No complaints in the dry season? Only one drain was made before the fomine and no objection was made. In the first three or four years a good deel of waste land was taken up by the people; then in 1894 a big flood came from the Gaikwar's territory and did a let of damage; the damage was enhanced by the construction of the Viramgam Mehsona Railway which blocked up the water; the consequence was that o large area was relinquished.
  - 70. Q. (Mr. Ibbetson) Was the drain large enough ?-No; not for heavy floods, we have lately mode a second drain which is much higger than the first; it is supposed to carry all the water coming from the Kadi side.
  - 71. Q. (The President)—Have you heard complaints about the silting up of rivers ?—I have.
  - 72. Q. Have you examined the Sobarmati river?-I hove; the silting is going on very slowly, so slightly that it cannot be noticed in a short period.
  - 73. (Mr. Higham) You say you have on alletment of Rs. 10,000 every year for village tanks ? Yes.
  - 74. Q. You don't spend it because you don't get orders in time ?-- Yes.
  - 75. Q. Do you incur no expenses until you receive orders in June or July; you draw your own pay?—Yes; works commenced during the previous year are kept in progress without waiting for the budget, but I cannot atart new works without special permission.
  - 76. Q. Do you ever get special permission?—I tried once when I was in charge of the Serat District, bot got no reply before I left.
  - 77. Q. When you got Budget orders you cannot go to work because the tanks are full of water?—Because the rainy season has commoneed and the tanks are full of water; they are full of water more or less during the culd season and we connot commence work until perhaps January or February and we have got only two mouths to do the work in.
    - 78. Q. You have also to work up your estimates ?-Yes.
  - 79. Q. How long does this take?-It does not take long; it depends upon the size of the tank; o sub-overseer makes the survey.
  - 80. Q. What sort of survey?-Ho has to take levels ond find the catchment area.
  - 81. Q. Why has he to find the catchment area if it is only a question of diggiog out the tank ?-These tunks me not merely dug out.
  - 82. Q. What is done?-Irrigetion tanks do not require deepeuing as a rule, we have to repair the bund and we try to raise the full supply level if possible.
  - 83. Q. By roising the bund?-Yes. We simply take a longitudinal section of the bund, measure the catchment oren of the tank, and take cross sections of the bund.
  - 84. Q. Why do you want the catchioent area?— Beconse it is laid down by the rules for preparing plans and estimates of these tanks. For tanks which are not taken in hand for a large number of years it is necessary to moke complete plans showing how tho tank will be fed from

- the catchment. A large number of these tanks have not hoen tonehed for years.
- 85. Q. How many tanks have you got P-1,286 tanks, large and small.
- 86. Q. If each tank is overhauled once in 20 years you must clear about 60 tanks o year?—Yes; but it is now proposed to give up about 400 small tonks.
- 87. Q. Yon will then have only 800 It will not take long to survey them?—Out of these a good many larger ones have been repaired in past years. During the last famine we repaired 32 tanks.
- 88. Q. Not more than that ? What did you do as relief work?—The people were employed on village tanks, railways, and roads.
- 89. Q. Why did you not put thom on your tanks ?-Because we had to select localities for relief purposes; we secons we had to select localities for relief purposes; we were not free to start works wherever we liked; the tooks were not always in the right places and the number of works in hand at one time was limited by Government orders. They would not let us do more than about 20 or 25 works ot the same time.
- 90. Q. You have only 800 tanks which want repairs; if you cleared thom in 20 years, that would be 40 tanks a year ?-Yes.
- 91. Q.- That would not require a large establishment?-No.
- 92. Q. Have you a list of these tanks !- Yes; it was propered by the Public Works Department in 1894; previous to that we had no regolar lists.
- previous to that we had no regoin lists.

  03. Q. Are you taking them up for repair in rotation?—No; before the tanks are surveyed loquiries are made whether the villagers are willing to pay their 10 per ceat contribution. The villagers apply to the Collector; the Collector writes to the Pablic Works Department, and the Public Works Department inquire of the Collector whether the villagers are willing to pay the contribution. In some places the villagers decline to pay; in other places they are willing to contribute, and then the places are prepared. prepared.
- 94. Q. Hawlong does it take to get a reply from the villagors ?- In some cases it takes months.
- 95. Q. How long does it take to survey the tanks ?-Thot depends upon the establishment and how the matter is taken up.
- 96. Q. With regard to the Sabaranti Canol you have expressed an opinion that it ought to pay 5 or 6 per cent. Yes.
- 97. Q. What area do you propose to irrigate?-About 32,000 acres.
- 98. Q. Mr. Beale estimates that the roturn will be only 1 per cent. He reduces the area very much? - That is a matter of opinion. In the first place Mr. Benle has based his estimate oo the total culturable area being 75,000 ocres; I fied that the outurable area will be a lakh of oeres,
- 99. Q. The talukdari records show 59,000 acres of rice; you don't accept that lignic?—Nn; I found out the total area from the Surroy Sittlement Report, I think we shall got 30,000 acres of rice onnually.
- 100. Q. If you have to stort relief works could you put relief labour on the big out ?-Yes.
- 101. Q Are you ready to start; is it lined out ?but it would not take long to line out a portion of the emind; if I recoive instructions to commence the survey to-day I could start work within a month.
  - 102. Q. You could employ may amount of labour ?-Yes.
- 103. Q. What is the length of the canol?-The main canal is 27 miles long.
- 101. Q. You say the rivers raise their beds?-Very slowly.
  - 105. Q. What have you got to go upon ?-Only hearsny.
  - 106. Q. You have never made measurements? Never.
- 107. Q. (Mr. Muir-Mackenzie) -I sit n fact that the bed of the Sabarmoti is rising?—Near Dholka silt is forming here and there, but I cannot say that the bed of the Sabarmati is rising perceptibly.
- 108. Q. People say you can ford it now at Shohibag at a time of year when io formor days you had to cross it hy forry?—I thick people say that io formor years it was impossible to furd the river near Shahibag in February, during the last eight years it has been quite possible to do so.

- I think this impression has been caused by the scanty rainfall of secont years.
- 100. Q. (Me. Hipkort)-Is the Nat in your district? - Y cs.
- 110. Q. What is it? It is a large shallow lake.
- 111. Q. Has it brackish or fresh water !- It is su the mouth of January; and then it becomes brackish -It is sweet till
- 112. Q. Does the water lio there all the year round ?-Yes, more or less.
- 113. Q. htnre you any idea of draining it?-No.
- 114. Q. Could you take the water anywhere else?—It is a difficult que tion to answer without a survey.
- 115. Q. What is the size of the lake?-About 20 square
  - 116. Q. Haw deep?-About five or six feet.
- 117. Q. (The President)-Is the water above the level of the seal-1 could not say; I think it must be a little higher than the sea.
- 118. Q. It is between the Rann of Cutch and the Bay of Cambay ?-Yes.
- 119. Q. When you have no rainfall does it contract?-
  - 120. Q. Does it depend upon rainfall?-Yes.
- 121. Q. Have you any idea of the feeding of these tanks from rivers?—Generally the tanks cannot be fed from rivers; it is only possible in the case of the Khari river. In the Matar Talaka it is possible to feed the tanks from the river by making cuts.
- 122. Q. Has that been tried?-I have made trinis to that effect, it is only n matter of money, it is quite feasible.
- 123. Q. Is there any idea of making these cuts in case you want to employ relief labour f—1 have started one of these tanks in Kalra this year for famine labour.
- 12 L Q. Is relief lahour going on now?—Yes; the tank is under the Kaira Engineer.
- 125. Q. What are you going to do in Ahmsdahad in case of france?—We have got two or three dmins to make; and the Bolh reservoir dum, some railway work and the Sabarmati Canal.
- 126. Q. Where is your programmof liare you got it here?—We have got it ready in print, but I haven't got a copr here.
- 127. Q. Has it been approved by the Local Government?

  —It was approved by the Commissioner and sent to the Local Government and approved by them.
- 123. Q. Yon spenk of the leakage of the Hathmati Caral?—We have diminished a great deal of it by improving the slope of the first ten miles of the canal.
- 129. Q. Area irrigated by that canal cannot be extended? It is not possible to extend it, because the soil is not suit able for rice; the maximum rabl cultivation is about 3,500
- 130. Q. The soil is not suitable for rice ?-Not at all : but the canal will not pay unless you grow rice. No canal in Gnjarat will be of any good except for rice.
- 131. Q. Supposing the canal was not there, what would the rayats growf-Wheat, lapri and juari.
- 132. Q. They make more out of rice?-Yes, but it is rather expensive to Government, because we are obliged to give them three times the water that is required for rice elsewhere. During the measoon the only crop requiring water is rice
- 183. Q. You cannot store mater?-No, we have no reser-Trir.
- 184. Q. Could you not pass the water down for other trigation i-I made proposals to stop rice cultivation on the Hathmati Canal altogether; it was so wasselol; I proposed to give the water to the Khari Cut, where it would ighte three times the area it does here; but nothing came of that proposal.
- 135. Q. When did you make the proposal?-Some years ne2
- 150, Q. It is vill urder consideration?-I do not know.
- 137. Q. D.es rice do my harm on the Hathmatië-No; but we are not getting the same broudt from the water that we would live.
- 185. Q. (Mr. Illetion)—If you have the water, could you not extern rabi cultivation on the Hathmati Canal?

- No, because the sail is so randy; it takes a lot of water; Mr. Tura-it is not possible to extend rabi cultivation; you can get purvate 5,000 acres at the most.
- 130. Q. The people don't want water for rabi: They take it to a small extent; only people who have no wells are using canal mater.
- 140. Q. Ropers 5,33,900 which you mentioned is to be spent on putting the tanks into good order and it would not that amount whether it is done non or spread over 20 years F -- Yes.
- 141. Q. They have all been mented of late years?-No; only a small number of them
- 142. Q. Would one-third of the annual revenue be anfileeient to keep them in good order?-It would be more than sofficient.
- 143. Q. What would be eatherent?-About one-fifth of the rareone.
- 141 Q. (Mr. Muir-Mackenzie)—Are there no orders of Government that the tanks should not be repaired without special sanction, if the cost of repairs exceeds ten times the revenue !- Yes ; there are orders to that effect.
- 145. Q. (Mr. Ibbetton)—And where it is anticipated that the cost of repairing is not more than ten times the resence?—Such cases would be ferr.
- 146. Q. Thee tanks have not been repaired ?-Only a few of the more important ones have been repaired.
- 147. Q. The Hathmati Canal is credited with a water rate of so many rapecs an nero?—Yes, subject to the reduction of the water rate fixed at the lost revision of settlement.
- 149. Q. On the Khari Cut also is there a fixed water rate?

   Yes, there is a canal rate of Ra. 7 per aere, subject to the deduction on account of mater revenue assessed by the Herenne Department.
- 149. Q. Do you think this credit represents the full value of water?—I think the rates now charged are very fair: Rs. 7 on the Khari Cat and Rs. 3 on the Hathmati Canni with deductions of water rato which have been fixed by the Survey Department.
- 150. Q. Rupces 7 is the canal water rate?-Yes; but we do not take credit for that.
- 151. Q. (Mr. Migham)—How is that ?—I do not know they are shown; we simply take credit for sums realized; the whole of the rates are not credited to us.
- 132. Q. (Mr. Ibbetson)—Suppose the water rate is fixed at Rs. 2 per nere; then a man urrigating rice has to pay Rs. 2 in his consolidated assessment and Rs. 5 as canal dues; what are you going to credit to the canal, Rs. 5 or -Only Rs. 5.
  - 153 Q Water rate is not credited by you ?-No.
- 151 Q. Doo't you think you have a fair claim to it f-No; we are supposed to supply less water from our canal to fields on which the Survey Department has fixed the rate for water at Rs. 2, because the field bus got certain water advantages already.
- 165. Q. This water rate means a rate for rain?-For rain as well as tank.
- Tain as well as tank.

  156. Q. (Mr. Ibbetson)—Why is the onter rate on the Khuri Cat double that on the Hatbmati Canal?—Because the soil is rough richer and more soltable for rice. The Hathmati soil is not suitable for rice, it is very sandy and not so rich as the Kharl soil.
- 157. Q. Out of the 1,300 tanks most are small; are there any large ones !- There are a number of large ones nies.
- 158. Q. You do not think there is much room for making new tanks; have surveys been made?—No, I do not think we could find many sites for new tanks.
- 159. Q. You do not think it is worth while making a arrey f-I do not think so except in certain parts.
- 160. Q. You would sorrey certain parts?-Yes, but nothing extensive.
- 161. Q You say that Local funds have been spent on irrigation tanks?—You.
- 162 Q. Supposing the Local Boards had the water revenue swigned to them, do you think they could be needly employed in repairing the small retarks?—I think it would be difficult for them to manage them.
- 163. Q. Why?-Beause they have got limited establishment.
- 161. Q. If money is given them they could train men properly i-That is a question which I have not thought

5 Pet. 01.

Mr. Tarapurrala.

- 165. Q. (Mr. Rajaratna Mdlr.) Is the oa rule in the Bembay Presidency that land within n certain distance of a canal constructed by Government is liable to pay water rate, 6 Dec 01. whether irrigated or not ?—Yes.
  - 166. Q. What is the distance?-Two hundred yards.
  - 167. Q. For percolation?—nud whether irrigated or net?—Yes; provided a wet crop is grown.
  - 168. Q. On the Hathmati Canal how much of the area commanded comes within the prescribed distance of 200 yards?—Abent 300 acres.
  - 169. Q. Does the rule refer to branch channels also?-Yes.
  - 170. Q. Mr. Bealo classifier tanks as first class and second lass. What are first class works?—They are hig tanks; I don't know the distinction.
  - 171. Q. How many tanks were repaired during the famine?—Thirty-two.
  - 172. Q. What amount was spent on them ?-About ten lakhs.
    - 173. Q. Rupces 10,00,000 on 32 tanksf-Yes.
  - 174. Q. Want would be the normal value of the work done?-About 6 laklis.
    - 175. Q. Were they hig tanks ?-Yes.
  - 176. Q. What was the revenue they paid before they were repaired?—I could not say.
  - 177. Q. What probable increase do you expect?-A fair increase.
  - 178. Q. Can you say from personal knowledge that in their present condition these tanks are capable of irrigating the full area? - In fairly good years they are.
  - 179. Q. You say that 23 per cent. for establishment charges is n henvy item ?-Yes.
  - 180. Q. What is the actual cost taking the whole district or division?-I could not say.
  - 181. Q. You must have some idea. Would it be 20 per cent.?—Perhaps not more than 12 per cent. for large works.
  - 182 Q I am not referring to any particular works ; taking an average of three or four years would a 20 per cent. debit he very much higher than your netual charges?—Twentythree per cent. is debited for large works.
  - 183. Q. What is debited for small works?—There is no debit made; notnal charges are debited. On the Sabarmati project we would be debited with 23 per cent.
  - 184. Q. There are some debits under the heading of collection charges ?- Yes.
  - 185. Q. Will you kindly explain what they are? statement is prepared by us of the amounts to be realized from different landholders for water supplied from nur canals. This statement is sent to the Collector and the Collector realizes. The village officers are paid 5 per cent. of the actual realization for their trouble; this is charged to the works.
  - 186. Q. For what works?-Only for those fer which capital accounts nro kept.
  - 187. Q. In this statement collection charges and gross revenue are given; you will find the charges are mostly 10 per cent. 1-On the Hathmeti and other capital account works they clarge o per cent.; I verified that yesterday; we submit a statement to the Collector when our nesessment work is finished; the whols work of collection is managed by the Secretariat and the Rovenuo Department.
  - 188. Q. What is the cost of the establishment?-It comes to very little.
  - 189. Q. You have a separate measuring establishment to maintain?—It is oot a separate establishment; only additional surveyers are employed.
  - 190. Q. Once the land is irrigated is it not classed as wet permanently?-No; you are not bound to pay water rate on the same land always.
  - 191. Q. Do you receive revenue both from tanks and canals P-I simply look after the canals; all tank revenue is collected by the Revenue Department; I have got nothing to de with that.
  - 192. Q. You have no major tanks under the Public Works Department?—No.
  - 193. Q. In reply to printed question 15, you say "irrigation is supplemented by well water in case of late commencement of rain and no supply in the reservoir

- for rice seedlings." In such cases do you make any abatement in your water rate ?-Yos.
- 194. Q. Do you remit the whole water rate?—Yos; if the whole crop is destroyed we take nothing.
- 195. Q. Supposing a crop is matured on the canal supply supplemented by well irrigation?—We charge half rates.
- 196. Q. In your written reply, you give the following

				Aores.
Hathmati Canal	•	•	•	8,000
Khari Cut .	٠	•	•	3,000
Khari sluices				8,800
Tanks				26,600

Do you think those areas will be protected in times of drought ?-Unless we have storage on the Hathmati Canal the areas on the cansis could not be protected.

- 197. Q. In times of drought could you protect the areas mentioned?—We could not protect them at all. Last year and this year there was not a single acre protected.
- 198. Q. When the storago works are completed will the Hathmati Canal be able to protect that area?—I, doubt it very much. In a year of complete drought like 1899 I do not know whether the bigger reservoir on the Hathmati Canal would give any appreciable protection because the reservoir would very probably run dry.
- 199. Q. (Mr. Muir-Mackenzie)—Regarding rice onliivation in this district that does not receive water from the tanks do you support the Commissioner's statement that it talls in 2 or 3 years out of 5?—Yes.
- 200. Q. D. you think that there are very few sites for tanks left?—Yes, in the rice country.
- 201. Q. Is it worth while baving surveys?-It may be worth while having a few surveys made.
- 203. Q. Saline edlorescence is caused in your experience by over irrigation?-No.
- 203. Q. And water-logging?—On the Khari about 10 per cent. of the land has suffered budly on account of waterlogging and salt; but that system has been going on for the last 100 or 200 years.
- 201. Q. Has water-logging been increased in the country of late years?—Yes, considerably in Viramgam and Sanand on account of the construction of a drain of late years by the Gaikwar. The first serious complaints of water logging legan after the great flood of 1894.
- 205. Q. It was caused by that flood?—Yes; the flood was intensified by the Kadi Division drains made in the Gaikwar's territory.
- 200. Q. You spent 10 lakbs in the famine on repairs of irrigation tanks  $\tilde{r} \rightarrow Yes$ .
- 207. Q. Was it all spont on repairs ?-Only to a small extent on repairs, mostly on improvements, such as deepening.
- 203. Q. The 10 lakhs were spent simply on account of famine ?-Yes.
- 209. Q. Had it not been for famine on these 32 tanks we should not have spent more than Rs. 50,000 ?-No.
- 210. Q. If you had had more money to spend you could have repaired more tanks ?-It was not practicable.
- 211. Q. Why not?—We were restricted as to the number of works by the instructions of Government; we might have done n larger number of tanks in 1899 but we were restricted.
- 212. Q. Due to instructions as to concentration ?-Yes; we could not employ 100 people on these tanks; we were obliged to employ a large number - 5,000 or 10,000 -- in each place.
- 213. Q. The charge for percolation is very high on the Hathmati Canal ?-Generally.
- 214. Q. I never heard of such a high charge anywhere else?—It is in necordance with the Act. The Canal Act lays that down.

I.—Letter from Superintending Engineer, Northern Division, to the Chief Steretary to Bombay Government, Famine Department,—No. 6114, dated 25th November 1901.

In reference to Government Resalution No. 2275 of 26th October 1903 and intimation that I am nominated as a witness before the Irregation Commission, I have the locuour to state that the memorandum accompanying the Government Resolution and the detail questions from forerment Resolution and the detail questions in con-tinuation of it appear to require replies especially from each district and do not admit of generalization for the whole Division. I therefore refinin from attempting details and confine myself to giving my general views on Gujarát in light of the memorandum and brief answers on Guyrat in light of the menioral and and priof answers to the second paper. My experience of Gojarat goes back to 1859, when I was an Assistant Engineer on the Femhay, Baroda and Central India Raiway, and with the exception of about two years when I was in the Decean, my service has been enthely in Gujarat and Kathiaway. I do not be climate to at once say that and käthikwär. I do not hesitate to at once say that Gnjaråt is not a district subject to famine, and in my opinion is not in want of famine projective works. It is essentially a very fertile land, which in normal years—and these are the rule and not the exception—yields a good return to its agriculturists in cope they can raise without aid of irrigation; but well-irrigation is practised more or less all over it, as water is generally within workable death, and profits from the last of wratified to a cartain event. and profits from tanks its also practised to a certain extent when the tanks lend themselves to it, while the only canal systems we have in the Division (the Hathanti, Khari Cut and Klari Sluices in Ahmadabad) are appreciated and and Klari Sluices in Ahmadabad) are appreciated and patronized for rice cultivation, but the country is in no way dependent on their aids to cultivation, its staple crops being grains and cotton, both of which it can grow without irrigation. By these remarks I do not intend to in any way deprecate irrigation, but make them to illustrate my opinion of the natural capabilities of Gujarát country. The geological features of the country under report may be divided into a few main heids. That from Surat Collectorate in the south to the north of the Broach Collectorate where it meets the Gackwar territory is all more or less rich black soil growing grain and cotton whom tany irrigation; the cultivators preferring these ordinary crops and not going in for irrigation except in a small, way and special cases in abnormal years. Water in found almost everywhere in wells fed by percolation of enriface water in most cross but from eprings or underground streams in others, the strata of the sub-soil being salme in many places and expecially towards the frings of the country along the especially towards the fringe of the country along the caboard where deepeoing wells leads to getting salt water. A large number of rivers run through the Surat District, A large number of rivers run through the Surat District, but are subject to tidal influence from 10 to 20 miles up. In Brosch the rivers are few and small if you exclude the Nerbudda. North of the Mhye River you enter Kaura and here the Hack roll is lost, its place being taken by a bind of learn which extends up north more or less inixed with rain and forms the general features of the soil up through Knim and Ahmadabad, and so far as that goes on up to Piliappar getting u ere sardy the further north it advances. The western talinkas of the Panch Mahdis come under the same enterprise and its only averaging is some of the waters and estegory and its out ranch Sansar come under the same category and its out exception is some of the western and north-western talukas of Ahmalabad, Virangám and Sánand, with parts of Phundhuka and Pholku, where there is a certain proportion of black soil that grows cotton. The country is generally well served with a nanober of rivers country is generally well served with a number of rivers running from cert to west through it which have a more of less perunnial flow in normal years, and no doubt largely supply it a wella of the distret which ner goal and pleutiful, were no it doubt from 25 to 100 feet. The Eastern Parel Marshitz a different nature of country altogether, leage July and brasily timbered with the sallays, more or less thack soil and fertile near rule, but with a goal deal of stony where lard interpreted. To do water is obtained to a rule in wells of shallow depth sinking desperanting recklingation in his the Division may be summed up shortly. Of carakt their are none excepting the Hutbursti and Khari staten in Almalatad, which care but a small portion of its Cellecterate and are follows from a connection part of view, it high in negret years they encourage, the growner relew, it ough in nerval years they encourage the groung of the rice, and usually some find acres of the are grown with their sile. The vistems depind for the reapply on the listing it and librari library, and in bod years they run so it, and in the last three years they have practically and the last three years they have practically folied alt gebien.

Firsts - When these about of their nater being used with little or no life, integation in small patches is dene from

them; Ahmalabad, Kairs and Sarat being best supplied with them and Brooch and Pauch Mahala the worst.

Bunds.—In the flat low-lying plains of Virangam and some other places towards the "Null" and Gulf of Couley the cultivators have introduced a system of throwing up long low hunds across slight dispressions in the fields and thus holding up large areas of water which just suffice to give them rice crops below the bunds, while wheat is grown on the damp land above the bunds as the water time off it.

Wells - Gujarat as n rule is plentifully supplied with wells, the largest number heing in Ahnadabul and Kalra and the least in Brouch. In the least seed of Guiards the wells generally run deep with good supply feeding from percolation through the sandy strate below, but in the more sandy portions the supply seems to be nearer the surface though not sombuniant and in some tracts getting leastly breakly bend and exactable for a decourage to getting the surface though not sombuniant and in some tracts getting mere sandy portions the supply seems to be mearer the surface though not somban iant and in some tracts getting bracki-h and solit, especially if you deepen the wells a little. In the black soll cenuity the wells are generally supplied from drainage of surface water which is held in the black soil and slowly works down to the weils and feeds them. Nearly all the best wells are situated close to tanks or water re-ceivers of some sort. The lower water in the black soil districts is very often salt, and hence you have to depend on the percolated surface water thungh there are cases where deep wells git a sweet supply from springs or other undergro, all supply. I hope to soon have a map ready showing the general water features of wells in all districts. It may generally be said that, excluding garden produce and a little sugarcane, rice is the one crop grown by means of irrigation, and as Gajarát rice is of fine quality, it is a crop that pays well, and wherever water is available cultivators have taken advantage of it to produce rice. There ore also certain tracts of country in both Ahoadabid and Kaira which are known on "the lands," as they lend themselves to its cultivation by holding up sufficient water within little bunds from normal rainfall to produce rice with but little sid, if any, from irrigation. Since the cannals in Ahmadabid were made the people have quickly taken advantage of them to go in for rice cultivation in preference to dry crops, and it is a question how far the production of the moto valuable crops may be taken as a benefit to the district generally and a protection squinst bad years, an it certainly should be, if the people laid up the profits of good years to tide over the losses of had; but there appears great doubt whether they do this as was so strongly demonstrated to the late years of famine, when the profits of good years to the over the losses of that; but there appears great doubt whether they do this as were strongly demonstrated in the late years of faming, when the presumed rich cultivators of Gujarát so quickly fell into a condition of want and distress which their habits of life and food onabled them so bally to withstand. How far irrigation can enrich the country generally and act as a famine protective is difficult to say, but undoubte ily the richer the produce of the country the larger resources there richer the produce of the country the larger resources there should be in it, and encouragement of brightion ahould be useful to this end. Admitting the fact, the question to be considered is how far it can be practicably developed. In Ahmadabid, where there are the existing count systems, we can effect considerable improvements be increasing reservoirs, and the first of these projects is the "Bokh, while, while not costly, will give a considerable increase to the Khari Cunal system, and this in my opinion should be carried out. We then have an entirely new scheme, the Sabirmati Canal, which is now under consideration, and this completes the list for Ahmadabid. In Kaira there are no cann's at all except a length of the Khari system which supplies some Kaira land, but a suggestion has been made to bould the Mhys Elver and thus may be a possible scheme; to brind the Mhys River and thus may been possible scheme; but I have not sufficient information at present before me to give any opinion in it. In Surat there is the old Tapta project, but it generally supplies the black soil country and has not with opposition from Rivenue Officers.

has not with epposition from Moveme Unicers.

Timels.—There are no creatin number of these taken up in the fewice, if which the lest certainly should be completely, and some proposal for the Mandel Taluka of Surat might be worked up. The Markila tank in Panel. Mahdis he so fix advance i that it would be a filly in my opinion not to complete it. General and more curful attention to all existing infiguities tanks I would advocate, as also sources tracked where the Bindse' existent can be extended and water held up temporarily, as is done in Viringsim. Tanks outer to it in Pack coil do held nater so far as my experience program fairly high black soil hands can be made, if provide curtically, without marking "cores."

Mr. White. 5 Doc. 01.

Wells.—These are the backbone of irrigation in Gujarát and choold in my opinion be encouraged as much as possible after careful enquiry as to how far the different diatricts can bear any increase, taking into consideration their resources for minure itself and nature of soil to stand concentrat irrigating. It will be noticed from memorandum submitted by the Director of Land Records and Agriculture that for Gujarát the areas irrigated by different systems were as below in the two years—I select 1886-1897 as a normal year and 1899-1900 as a famine year:—

				****	1000.

# II.—Replies to Questions. A.—General.

- 1. Gujarat generally is a district I have known more or less for the last 30 years as a Railway and Public Works Engineer.
  - 2. See local officers' replies.
  - 8. (1) No.
    - (2) No.
    - (2) 10.
    - (3) Questienable.
    - (4) Yes, in parts of Broach and Surat.
    - (5) Net in normal years.
    - (6) to (8) Revenue officers can best answer.
    - (9) General fortility of the country and case with which ordinary ramtall enables good crops to be produced.
- 4. Will be replied to by Revenne officere.
- 5. Do. de. do.
- 6. No. A desire for irrigation has been expressed by the people of Abmadabad since the famine.

## B.-CANALS OF CONTINCOUS FLOW.

- 7. (1), (2) and (3'.—Probably from 40 to 100 per cent-from one or other of the reasons.
  - 8. (1) Roughly 50 or 75 per cent.
    - (2) Cannot answer.
  - 9. Will be best unswered by local officers.
  - 10. Will be noswered by Revenue nuthorities.
  - 11. Not so far as I knew.

## C .- CANALS OF INTERMITTENT FLOW-

- 12. See Abmadabad Executive Engineer's reply.
- 13. Answer to previous Question 7 will apply to this except in snb-head C, when the value of the cunal is of a negative order, as the collivatore may prepare land in anticipation of getting water which they never receive.
- 14. The supply of water in Gujarát is mostly n demand in September and October, and so long no it does not feel the value of the irrigation is not diminished.
  - 15. Occasionally; under exceptional eironmetances.
  - 16. See answer to Question 8.
  - 17. Do. do.
  - 18. Will be answered by Revenne authorities.
  - 19. See maswer to Question No. 2.
  - 20. Sec Excentive Engineer's reply.
- 21. None.
- 22. No.

## D.-TANKS.

- 23. (1) Generally by their own catchment.
  - (2) By the cultivators themselves in a permitive manner nader their own arrangements.

- (3) Varies considerably according to rainfall and the crops the water is used for, but generally from July to October.
- (4) Vario s from n few acree to some hundreds.
- 24. Differs in different districts. See Surat and Breach Executive Engineer's reply.
  - 25. No remarks.
  - 26. Occasionally and only when essential.
  - 27. Cannot answer eatisfectorily.
  - 28. See local officers' replies.
  - 9. Do. do.
  - 30. Do. do.
  - 31. Revenne officers can best answer.
- 32. Yos, but I regret I cannot at present reply to the final part of the questione.
- 33. Tanks certainly de silt up and mero so in black seil country. I can give no statistics on the point, but tanks from time to time are dug out, the silt being romoved dry in the hot weather and often taken by the villagers for purposes of mnure.

#### E.-WELLS.

- 31. (1) Statements will be sabmitted, but depths vary considerably from 20 to 160 feet or more.
  - (2) Generally from porcolation-
    - (a) Not in an ordinary year.
    - (b) Yes.
  - (3) Differs very greatly, say, from 3 to 15 hundred rapees.
  - (4) Unknown.
  - (5) By bullock " mot."
  - (6) Unknown.
  - (7) Do.
  - 35. Can best be answered by Revenue officers.
  - 36. De. do. de. de.
  - 37. De. do. do. do.
  - 38. (1) No.
    - (2) No.

I am not aware of any special assistance baving been offered by Government, but local officers have given advice and in certain places trial borings have been made hoth by Government and privato individuals: so far as my knowledge goss, horings have shown favourable results in a fow cases, but more generally have failed. I think it would be useful to bere for the purpose of ascertining whether sweet water can be obtained below the saline etrata which exist in a good many pertions of the different Collectorates.

- 39. A question I am not prepared to reply to withent going more closely into it, but generally speaking I should be inclined to encourage the construction of wells.
- 40. Temperary wells are occasionally used in the districts which will admit of their construction, but they are not practicable in very eardy or black soil. They are a very poor protection against drought. I am not propared to answer the last question.
- -P. S.—A point, I eee, I have omitted to notice ie "water-logging." In nearly all the Collectorates of Gejarat damage from water-logging has from time to time heen reported, and in many cases remedial measures have heen carried out, but it is questiouable with what measure of success, as in many cases where beasts accrued on certain tracts injury occurred on others, and the very cultivators who begged for drains to clear water away from their landa have since in some places seked for them to be stopped up, and in the case of some small drains in Broach have themeelves bunded up the drains. The truth is, that we do not yet seem to therengally understand all the effects of altering the water conditions on different classes of soil. In econo places when we bring water on, it seems to spoil the land by raising up cult: in others when the water is drawn away the people complain that the good top surface soil goes with it, and so on. The heavy floode of 1894-95 which drowned large areas of land in Kaira and, I think, also parts of Almadabad made a number of tanks and also wells "brackish," se much so that in some oness irrigation from them was abaudened, the Trag irrigation tank in Kaira heiag nease ia point. I would advocate a careful survey of the results of the drainage as far done before deciding on new proposals.

- 1. Q. (The President)—In your letter to Chief Secretary you say:—" Gojarit is not a district sobject to famine and in my opinion is not in want of famine protective works;" you do not recommend that works like the Sabaranati or the Hathmati Canaly should be put on the list of famine works?—I think they should be treated rather as commercial works rather as commercial works.
- 2. Q. Wruld you means either of them as works to be carried out in famine time as relief works?—I should put the Sabarmati in that extensity.
- S. Q. From a commercial standpoint do the Hathmati and Khari Canals pay their war ?—I do not think so.
- 4. Q. Ther ore emplie of improvement financially f-
- 5. Q. What would you do to improve them f ... Storage is the great requirement of the district which is well served by the river which runs through it.
- by the river which runs through it.

  6. Q. Would you advocate a through hydrographic extract of the country as received extrement, basing 1 da not man for direct irrigation but for storage reservoirs?—I should advocate it in places. In some parts when there are great flat meas it would be quite needless. The conditions of the country are not properly known, we have never sufficiently studied the question. The lest extehnells for storage for the Huthmall and Khari systems are probably in the I'dar State. For the Panch Mahalls the test sites would be in Itaroda where the heads of the rivers lie. There are sites for tanks in our territory, but for small tanks only. A thorough survey of the country is required as no really do not know what is or what is not possible.

  7. O. Mr. Lely thinks that the rivers masing north
- 7. Q. Mr. Lely thinks that the rivers passing north 7. Q. Mr. Lely thinks that the rivers passing north and south of this district are silting up. Have you say personal knowledge of that?—I have visited certain rivers, after a lay-e of a good many years, and have noticed that they are distinctly silting up; the resulting delta foing further out to sea. For instance, all the waters of the lians now slak underground and disappear before they reach the sea. The deltas on the Tapti and the Nerbodda have river so high that cultivation has been started in many of the lebuds. After ten years I went with Mr. Lely to Dholta and found cultivation where there were only said and tunarish before. As far as I can see, the beds have been raised and the channels blocked to a great extent.
  - 8. Q. Have ony levels been taken?-No.
- 9. Q. (Mr Muir-Maclenzie)—Have you heard that 30 years ago there used to be a ferry at Shahibag F-No. I have some idea of having seen n basin there.
- 10. Q. (The President)—We have heard complaints of times done by dumns in water-loyeed tracts. Have you 10. Q. (The President)—We have heard companies of damage done by drawns in water-logged tracts. Have you seen anything of this?—I am open to correction, but from what I have seen, I think that in certain pieces the drains have taken off the water too quickly when in flood and have reduced off portions of the surface. I have seen "cutterings," in places, but I do not think that any extension large taken beach and as eive liarm bas been done-
- 11. Q. Has much damage been done by floods in past verts !—In many floods the Bailways held up water over large areas, and in 1891 great damage was done in Virungia, the whole country being floodel and cattle and sheep drowned. There were complaints that these floods were causing damage to the soil. A great amount of damage has been done in the Almadabad and Kaira Districts by abnormal floods in past years.
- 12. Q. What do you consider the best form of famina relief?—Some kind of earthwork. I should think cuttings like the Sabaromi Canal; digging new touts, improving cld ones, and making new bunds would be better than making reads and milesys.
- 13. Q. Do you advante irrigation by steam pamps?—I think that it is n good this gloer-courage. There is a tendency among well-to-do people to use promps for regular cultivation; certain persons not trying the experiment in the Ahmadalad Platrick and on the Salarmeth.
- 14. Q. Mount capital I suppose? -Yes, and Mr. J. N. Tata of Bombay is having deep borings made in the Eurat Daniel.
- 15. Q. Then there is a tendency for people to try experiments of that sorti-Yes, for some wealthy ones.
- 16 Q Yen see an objection to pumping mater out of the river?—From the Nerhudda I see name. In fact, a theory has been advorced by an Assistant Engineer that the enignar noirinate from the North Ha river would be to pump the mater into the energy of reservoir,
- 17. Q. (Mr. Her) are Yen were speaking about heavy for the gen know what the effect of these has honed

The figures of the loss are given to the Statistical Atlan. Mr. White Enormous damage has been done to crops by heavy feeds in certain years.

5 Pec. 03.

- 16. Q. Was the land rendered unculturable f-In some cases lands were covered with sand, in other places the soil was rendered saity. In places like Kulra it e tanks and wells were rendered brackish and useless for irrigation for
- 10. Q. Do you propose to moke my protective bonds or embunkments!—No. It would require a very large scheme to protect the district by bunds. I do not say for one moment that it is impossible to carry out such a gebenne, but it would be a very large project and has never, to my koow-ledge, been seriously proposed.
- 20. Q. Yoo have certain drainage proposals which will have the effect of bringing a considerable area of land under coltimion?—Yes, but I have no figures for them.
- 21 Q What are your proposals !- I propose to relieve the water-logged aress.
  - 22. Q. Can the water-logged lands be improved P-Yes.
- 23. Q. And improving them will resolt in recenue being paid on them !—I should think ro.
- 21. Q. Will there be an ancrease in cultivation f Yes, the main object of these drains will be to rehere the land and collect the mater. In Virangem there are large tanks which are filled to this way.
- 25. Q. Are there drainage schemes in the femine programme?—Yes. There is still scope for dimlorge in places.
- 26. Q. Complaints are made that in dry years there drains take off the water too fast?—I should imagine that to be the case; they want regulators.
- 27. Q. In o year when the rainfall is below the average the drains will have the effect of taking all the water off ?—
  Probably , it has been difficult to jodge oftent this during the past few years. Some of the drains have only just been made; in dry years perhaps they take away too inneh water; the villagers don't know their requirements.
- 25. Q. With a system of regulators and abandant rainfall 28. Q. With a system of regulators and soundant rainting could not the water be kept on the lands in dry years — Yes. There has been instances of this in Broach where the villagers asked for drains and have now bunded them up. Drains without some kind of regulators are not very neefal; the Executive Engineers have proposed to provide them in some of the drains to the Surat and other Districts.
- 29, Q. With regulators the drains would be useful?
- 30. Q. Are they proposed?-I do not know if definite proposels have been made. The Executive Engineer of Sorat has proposed regulators for his district.
- 31. Q. What about these hands which you describe on flat plains?-The land is flat in Virningam, and the villager that plains?—The land is flat in Virningain, and the villagers throw up a system of long low bonds across what are known as reas; there hold up the water to o depth of 4 or 5 feet and it spreads over o very large orea; they use the water for rice cultivatum below the band, and or the land behind the bund dries they alw wheat and gram. A good deal of cultivation gaes on in this way. There was an outery about it at places and complaints were made that by putting up so many bunds oo water was allowed to run to the rillages below.
- 32. Q. D. you propose that Government should make these bunds?—We should certainly have a survey made; then the question of whether the cultivators or Government then the question of whether the entrators or coverament should make the bunds can be considered. That would be a revenue question. We might have to pay compensa-tion if Government did work of that kind. There are only certain places where the configuration of the country would lend itself to these bunds.
- 33. Q. Un you think anything could be done in the may of constructing distributing having could be done in the way of constructing distributing having not the mouths of the hill arremati—The nully place we really have got sites for such moch is in the Pauch Mohils. There got a man prospecting three now. We can put soull dams across the streams and store up a certain mount of water.
- and store up a certain amount of water.

  3t. Q. Yoo would not Lave a high dam?—I think in some cases that might be done. Something in that way might be done in the Mandvi Taloka of Sunat and Meluca in Ahmeddad. It is east that in the Parel, Mahile there is no hand to give water to; I have been there and found to in a good many locus there is goodscill in the valleys; in good dead of it is covered with states and is called where there would layer the chand off; I have some the same soft of soil in Kathlawar Irought or less editivation.

Mr. White. 5 Dro. 01.

- 35. Q. Have you got records of the rise and fall of the big rivers?—The only records are in the Railway offices. They have records of the big floods but there is no daily gauging.
- 36. Q. When there is a great flood you record its height?—Yes, on the bridges which are sometimes awept away.
- 37. Q. Are not all these rivers crossed by the Railway ?-Yes.
  - 38. Q. In some cases they cross two or three times f-Yes.
- 30. Q. You don't think it possible to arrange with the Railway people to take records daily during the monson season, as is done in the Punjab?—Yes, I think we could do so where there are bridges.
  - 40. Q. In the cold weather it is not so important? -No.
- 41. Q. You could take n minimum gange?-Yes, we do that.
- 42. Q. That is a matter of gauging the discharge; I nm speaking of a gauge registering the height of the river?—Yes, practically, we do that.
- 48. Q. These irrigation works that you have in Gujarat are all classed as uninor works?—Yes, except the Hathmati Canul, they are classed under the heading of "minor" works. The other works in Gujarat are only small tanks which have hitherto not been properly worked up.
- 44. Q. What is the Hathmati classed as ?-A: a productive work.
- 46. Q. You say that the other works are classed as minor works?-Yes.
- 47. Q. Do you always get as much money as you want for improvements?—As a matter of fact these works are only small tanks. Heretofore there is no doubt that the subject has not been properly looked into as there has been no great want felt for them. They were standing for what they were worth. Now we get from the Government of India about a lakh a year, but we spend only half of it, because the grant comes at a time when we cannot utilize it.
- 48. Q. You get a grant of about n lukh of ropees?—Yes, I think so, it is in Mr. Beale's report.
- Mr. Beals.—The amount is two lakhs a year for the wbolo of the Bombay Presidency.
- 49. Q. Is that for first class works, Mr. Beale?—No, for second class irrigation works.
- 50. Q. (To witness)—So far as Gujarát is concerned do you get as much money as you want!—No, we want more money; half a lakh would not do much. During the last famiue we did a great deal and a great number of tanks were repaired in this fumine. Many of them want completing, and for that purpose we want money.
- 51. Q. Do you want a grently increased grant to carry out the works which have been proposed?—I do not think so; many of these tanks are really not in bad order; they only want small improvements.
- 52. Q. Do you depend for your money entirely on the Government of India?—Suall contributions are received from Local Boards for repairs of tanks.
  - 53. Q. Noue of your works are Provincial !-Nono.
  - 54. Q. They are all Imperial ?-Yes.
- 55. Q. Do you know whether it would be advantageous to provincialize these works f-1 have not given sufficient thought to that point.
- 56. Q. You did not want more money, you had as much money placed at your disposal as you could spaud?—As a matter of fact we have not had to do much; there was no outery and we never felt the want of much money; the people were satisfied; no doubt we could have done more if we had got the money in time. It always came too late—when the Executive Eugineer could not do mything. That is now being altered.
- 57. Q. (Mr. Ibbetson)—You say that Gujarat is pleutifully supplied with wells ?—Yes.
- 58. Q. Do you think there is room for increasing the uumber of wolls largely f—I have made some remarks in my statement on the subject. There are a good many wells in Kaira and Ahmadabad, where you have a light alluvial soil, but few in Broach and the Panch Maháls. Wells can be unseen. In Broach there is deep black soil.
- 59. Q. In the latter part there is, I suppose, not much scope for digging wells  ${}^{9}-No.$

- 60. Q. In the other part there is more scope ?—Yes, in the leamy soil there is great scope for the encouragement of irrigation by wells.
- 61. Q. Woald you ondeavour to holp the people by making trial borings?—We do advise them where there are good sites for wells and where they are likely to get good water. We have got a great deal of information coupiled from which we can generally guess where water might be found, but I do not thuck any Engineer could go into the compound here like a diviner and say "there is water here." We have no geological surveys in Gnjarát to help ns. My opinion is that n geological survey should be made.
- 62. Q. What elso?—We should also have a surface survey to see how our water can be conserved. In the abarmati and the Khari, a mass of water goes down to the Gulf; if that could be conserved we would be helping the rivers and the wells. I do not think you could do anything in the way of increasing wells without having more information to an we have at present.
- 63. Q. Supposing n rayat wants to sink n woll, do you think that a trial boring would be useful?—I do not think so unless you bore down about 20 feet; for if you have got surrounding wells the water runs low.
- 64. Q. Then you don't think that a trial boring is worth making in any individual oase?—I think trial borings are necessary where the water is at great depth, but the cost is very heavy.
- 65. Q. Could you give men rough iden of the cost of a trial buring !—1t depends upon the soil; it increases the deeper you go; boring 50 feet is expensive.
- 66. Q. What would it cost?-It costs Rs. 100 to go down
- 67. Q. What would the tools cost ?-Nearly Rs. 1,000.
- 68. Q. If you want to go down 100 feet it would cest Rs. 200?—From Rs. 200 to Rs. 500; and if you want to go down 200 feet it would cost Rs. 500 or Rs. 1,000.
- 69. Q. (Mr. Muir-Mackenzie)—Do you consider the repairing of small tanks would be a good famine relief measure?—Certainly.
- 70. Q. Do you consider such repairs to be the backbone of your relief programme this year?—Yes.
- 71. Q. Do you mean small tanks?-Small and large.
- 72. Q. I understand from Mr. Furdunji that orders are necessary to make plans and estimates?—Mr. Furdunji has been in only one district. When famine appears plans and estimates can be made without waiting for furmalities.
- 73. Q. Is there any chance of repairing all the tanks for the Rs. 5,30,000 which they are estimated to cost?—It would be a big scheme, and we are not prepared with plans.
- 74. Q. If you got ten lakes could you not repair them? If we have to spend ten lakes we should spend it chiefly on schemes connected with water. We intend to extend the number of rice tanks; they will be most beneficial.
- 76. Q. Would you prefer the Chord Railway?—The Railway would come in very woll as relief works We have to start work in the district where the people are worst off and we cannot march them long distances.
- 77. Q. In the localities where the tanks are you will not have to commence relief works !—Not in all.
- 78 Q. Do you think plenty of sites may be found for these rice tanks?—I would not say plenty; there are a good many sites where we might make these tanks, bunding them slightly to hold a certain amount of water, for cultivation.
- 79. Q. Is this only in the Northorn part?—Oh, in several places.
- 80. Q. In Kaira?—Mr. Robertson, I think, says that there are some sites there.
- 81. Q. Would you advocate the system which was suggested by one of the witnesses, namely, that ou the completion of minor tanks they should be entrusted to Local teards?—I nm not prepared to answer that question without a little more consideration. It depends on what staff the Local Boards have. Local Boards ean very well manage small tanks; but they want a working establishment; they must put a man ou the work and hold him responsible fur its proper management.

52. Q. You think Local Boards can do it?-Yes: I think there is nork which the Local Board could do if they have sufficient catablishment. They could in some cates improve and enlarge the tanks. I hold in my hands a letter from the Collector in which he says that it would be letter to hand over small tanks to civil ngeney and that

irrigation tanks should be left to the management of the Mr. White Public Works Department.

S3. Q. In order to get the estimates for these works eleved off quickly you will have in employ an additional establishment?—Yes, certainly. Looking to the amount of distress generally, I think that this is the best way of utilizing mener.

5 Pec. 61.

## EIGHTEENTH DAY.

## Surat, 9th Decr. 1901.

Witnesses Nos. 23 and 24 - Mr. Gular leuwar and Mr. Motinuar Buadway, Landowners, Amed.

Answers to printed questions by the witnesses.

In the talnks of Amod the land is of four different kinds -(1) black, (2) yellow, (3) mixed, i.e., black and yellow, (4)

There are no irrigated fields at present; but if there are satisfactory (complete) means of irrigation the yield from fields will increase by half ne anuch again.

It is necessary that there should be a rainfall of \$5 to 40 inches. The fall should be in light instalments and should be timely to suit the requirements of cultivation. Formerly the district was well wooled and the people were encouraged to plant fruit trees. These who planted the trees were held to be their owners on whatever land the trees might have been planted. But lately Government have, on the one hand, cut down the trees, and on the other, the people hand, cut down the trees, and on the other, the people have censed to plant more trees as they bore no claim over them. Thus there being no clumps of trees which are supposed to attract rain, the rainfall has been decreasing and the present fall is only half of what it was twenty years before.

Even during the south-west rains there is ordinarily a rant of nater felt in some parts. South-west mossoon is the principal monsoon.

Rice, "Brite", segarcine, "Kodra" and all kinds of regetable, as also tobacco, require to be watered by irrigation. Engarcine is planted before toons on and then requires to be watered. It requires water every eighth day in all staroos except the monsoon.

Tobacco and regetable require to be watered every eighth ay. Vegetable has to be watered all the twelve months of

Rice, "Kodra" and "Barto" are planted during the mousoa, and after the close thereof, i.e., in the months of October and Norember, required to be watered every tenth day. dar,

3. The small tanks in black soil hold water in the monsoon-But they either get dry by the time fields require to be watered, or hold a Fisch cotton s:ll little woter. Embankment can be constructed without "chunam" lime with black enrth which is sticky.

If black soil is to be irrigated it is not surprising that want of water-supply should be felt in years of famine. But want of water is left even in ordinary years, for the crops which are raised by irrigation do not require continuous rain, but only a tunely full at the intervals of eight, ten or afteren days. Besides, some crops require to be watered every fourth day, while others require water at the interval of a week. Hence it is not possible ever to get rain suited to the requirements of the different crops. Owing to the irrigularity of the rainfall n difficulty is experienced to watering the crops at deshed intervals. But even in black sell if strangements for water irrigation supply are made, or if the rainfall is normal, or good, the yield would be good. In this soil oning to smaller yield, as commared with If black soil is to be irrigated it is not surprising that

In this soil owing to smaller yield, as compared with other lands, in consequence of deficient rainfall thre would be a difficulty in the matter of revenue collection. But so larges the cultivator or the historiar las any other source of meaner, or has any savings of o'd there arises to difficulty in the collection of revenue, in accordance with the previous of the matter law. sions of the present law.

Owners of Dack toll fields are extremely analous that irrigation works be undertaken at Sinte expenditure, but no additional tax been that not untilevied from them, or their

rights any war prejudicially effected. If this were done the coltivation, as also the State revenue, will be henefited.

d. Government irrigation works,

If earals from Nerbudda be constructed and their water brought into the Dhudhar river near Bojadra, a great hene-fit will accrue to the cultivation of this taluka. Besides, it is necessary to construct big wells and tanks in other places.

6 and 6 not answered.

7. Wells.

Rayats have not obtained takavi from Government with sufficient free hand to enable them to construct "pakkn" wells; and these that have got taknvi have not obtained any concessions.

The best way is for Government to construct wells for the people at its own expense, because Government is the permanent master at the soil. If that were not done it, would be advantageous if, by giring taken to people, wells were constructed with fice concessions. It has particularly to be brought to ootive that Government charges interest at 5 per cent. on taken loans, while deposit of immery in banks get an interest of 3 per cent. Then it is clear that Government charges a much higher interest. It is necessary therefore that the rate of interest should be much lowered; if possible, it is necessary to have wells constructed by remitting a portion of taken loans ond interest and by increasing the present number of instalments as may be necessary to suit the oircumstances of the cultivator.

Owing to famine in 1899-190) and 1900 1901 the water-supply of the taluka line decreased by £0 per cent, nad in the western part of the taluka, aweet water in some of the big wells las become brockish. In this taluka big wells have not completely dried up, but small wells having dried are left without water.

8. Drainage channel.

There is no necessity.

9. Helief works undertaken during the famine.

In none work addernace during the famine.

In none of the tanks that were dug during the famine many are without any water. The reason it it is the scanty rainfall. This is also due to water being largely absorbed by the new day earth in the hed of tanks. Though all the water has been absorbed the heds are not yet well formed. Besides in some places the tanks have not been provided with proper inlets. These tanks being saturated in village sites are used by the people and do not afford facilities for irrigation. In some of the tanks lately deepened water is not available for estitle to drink.

10. Special request to the Commission.

To securial whether artism wells will prove useful in this district, it is accessary that Government should at its own expense make experiments three or four times in each tolula. It is necessary to have experimental farms in three or four villages in each taluka to show how the fertility of the sull is lacensed by irrigation, how different in do of manness can be used, and how to saw different hirds of crops. The people are not possessed of high eart of intelligence to improve the soil unless convinced by tractical example.

Mr. Gelah

9 Dec. 01.

Mr. Gulab Ishmar. 9 Dec. OL

- 1. Q. (The President)—I nodorstand you are n resident of Amod ?—Yes.
  - 2. Q. Do yoo own land thore?-Yos.
  - 3. Q. Did Amed suffer much from the famine ?-Yes.
- 4. Q. Was there much loss of life !- Yes, many people died, ood also numbers of cattle.
- 5. Q. How do you raise your crops ?-By rain water
- 8. Q. What steps do you think desirable to protoct your village ogninst the effects of famino?—Wells to irrigate the land woold be useful. By this means folder for cuttle and grain for the people can be produced.
- 7. Q. Why do you not make wolls?-I am unable to sink wells, no year after year we have had years; and, bosides, if I was to boild a well, the assessment on the laud will be raised.
- 6. Q. Sorely you know that that is not the case. Is that the generally provailing belief? -You, I believe so; the assessment is raised if a well is dag. A water-rate is charged if we irrigate other lands from our own wells also.
- 9. Q. Can you give any instance to show that that has been done?—In Sarban there is a field, io which a well was snnk by the landowner, and, because he irrigated land during the famino, he was oberged a water-rate, and had to water ossessment for that land, besides the dry ossessment he niroady paid.
- 10. Q. (Mr. Muir-Mackenzie)-When was the well dug P-In 1900.
- 11. Q. (Mr. Rajaratna Mdir.) Is that dry land or wet land?—It was not previously assessed at wet rates.
- 12. Q. (Mr. Muir-Mackenzie)-What was the assess ment before the well was snnk?-About Rs. 5 an acro: Rs. 2 more per acro were added.
- 19. Q. (The President)-In which taluka is that ?-In Amod.
- 14. Q. Were it not for this fear of increased assessment would you sink wells?-Yes.
- 15. Q. Woold you do that from your own means or get taken advances?—From taken advances, I think that the period of repayment should be extended, and the interest reduced.
- 16. Q. How long would you like the period to be extended?—To double the present, which is about five years.
- 17. Q. Would the people be content to bave the period extended to ten years !- Yes, each cultivotor should be treated leniently according to his means.
- 18. Q. What is the rate of interest ?-Five per cont.
- 19. Q. How much do you think it should be reduced?-To 2 per cent.
- 20. Q. Do you think, if the time was prolonged to ten years and the interest reduced to 2 per cent., there would be a great extension of wells P-Yes.
- 21. Q. What is the soil like in your villages?-There ore -(1) black, (2) gorat, (3) black cotton ond gorat mixed, (4) salt lands.
- 22. Q. What land would you irrigate onder the well?-
- 23. Q. How much land do you own?-100 acres.
- 24. Q. Do you think, if you had had wells before the famine, you would have been much better off now P-Yes.
- 25. Q. How much would a well irrigate?-It depends upon the capacity of the woter in the well; one well can irrigate four to five neres.
- 26. Q. I suppose you would like to put down several welle?—I would have one well in each number; the holdings are very senttered.
  - 27. Q. Are there any tanks near your villago?-Yes.
- 28. Q. Did the people owning land under them benefit by them doring the famino ?- No, there was no water in tho tanks.
  - 29. Q. Are the tanks in good repoir ?-Yos.
- 30. Q. As regards preporing for another famine, do you think a large extension of wells would be the best thing for the district of Breach?—It would benefit my taluka. I eannot speak for the rest of the district.
- 21. Q. In ordinary years of rainfull, would these wells bs used?—A little, because the rain is irregular. If rnin came in propor time, I would not have to use the wells. Rain does not come now when the grain is coming late car.

- 32. Q. Before 1899, the rain came pretty regularly?-
- 33. Q. Before the famine time, it would have been no use to have wells ?—No.
- 34. Q. (Mr. Ibbetson) . If you were going to make wells, and borrowed money from a sowear, what interest wou you pay !—It doponds upon the man who takes the lean.
- 85. Q. In the ease of a substantial man like yourself?-From three to six per cent.
- 36. Q. What would a small man have to pay ?-Nioc to twelve per ceat.
- 37. Q. Have you over borrowed money at 3 per cent? -Yes.
- 38. Q. (Mr. Muir-Mackenzie)-What for ?-For marriage expenses.
- 39. Q. (Mr. Rajaratna Mdlr.)—When do yon return the money?—Whenever I can.
- 40. Q. (Mr. Ibbetson)—What did you mean exactly whon you spoke just now of treating a man leniently according to his means?—Giving a poor man in some cases takavi free of interest.
- 41. Q. Are there many disused wells in your parts?—Not many; there are only about 200 to 300 wells in the whole taluka.
- 43. Q. (Mr. Rajaratna Mdlr.)—Do yoo know that Government borrows monoy at Bi per cont. P—Yes.
- 43. Q. Then, how do you expect them to inke 2 per ecot. ? -The land belongs to Government, and if cultivators are benefited, it would be to the interest of Government.
  - 44. Q. How ?-All the land belongs to Government.
- 45. Q. How will Government be benefited?—If the people are solvent, the Government assessments will be paid regularly.
- 46. Q. As regards the woter-rate of Rs. 2, the rules in Bombay exempt land in which wells are suck from increased assessment, are you aware of that?—No; when the land is cultivated, they do charge. When the sorvey was being introduced, lands situated near the wells were assessed at certain water-rates. At the next sottlement, if a well has been cunk in the meantime, Government will charge an increased water-
- 47. Q. In the ease of land on which you paid Rs. 2 extra, is there any tank near that ?—No.
- 48. Q. (Mr. Mair-Mackenzie)-What is the sub-soil water-rate P-I don't know.
- 40. Q. (Mr. Rajaraina Mdir.)—Do you know of many cases in your village, in which such extra charge has been made?—No; there may be many, I only know of one.
- 50. Q. Supposing takavi is givon at 2 per cent., repayable in 20 years, will you not be in a position to sink more wells in your land ?—I would sink more wells, if I were assured that no further assessment will be leviod.
  - 51. Q. For ever ?-Yes.
- 52. Q. Supposing you were told that in the next 30 years there would be no locrease of water-rate, and after that o low enhancement for nnother 30 years; what would be the result?—I cannot pay anything loore than I do at present.
  - 53. Q. What is the rate?-More than Rs. 5 per nere.
  - 54. Q. On all your land? Yes, it is not less.
- 55. Q. (The President)-Was it rounitted doring the fnmine?-No.
- 56. Q. (Mr. Muir-Mackenzie) Would you dig wells in black soil? Yes.
- 57. Q. What sort of erops would you irrigate on such soil f-Tobacco, rice, vegetables-in fact everything.
- 58. Q. Do regotobles grow as well in black soil os in gorat?-No.
- 50. Q. Does block soil want much more water than gorat ?—Yes.
- 60. Q. Is it beneficial to irrigate cotton ?-If it is watered when rain is short and the cotton crop commences to dry up, it will rovivo. I have not seen it done.
- 61. Q. If Government were to advance the capital for a well without laking any return, neither principal nor interest, would the ray at he willing to dig wells and then pay begsyat?

  Not the full bayayat rate.
- 82. Q. How much an acro? -One anna more than the present rate.

- 68. Q. Were many wells undeduring the famine in your neighbourhool?-About 10 to 15 wells were dug.
- 64. Q. Have they been used this year?—Government wanted to charge a water-rate, and so they were filled up-
- 65. Q. Who said that Government wanted to charge a water-rate?—I was questioned who I dog a well in Government land onto do my occupancy without permission.
- 66. Q. Do you suppose that, if you due a well in your own land, you would have to pay a water-rate afterwards.—Yes.
- 07. Q. Do you mean, when the settlement is revised, or will it be done at once f-This year I have been charged a water rate.
- Mr. Wales, Collector of Surat, explained that witness took nater from a Government well, and had lo pay.
- 6S. Q. (The President)—Is it your impression that, if you take takeve aleases and put down a well in your name land, there will be an enbanced rate?—The well I took

water from was not in my own occupancy; it was built by Mr. Gold's

69. Q. (Mr. Muir-Maclenzie) - Which is the more profitable crop, rice or culton? - Cotton.

70. Q. If lanks were made, would the people be ready to grow rice lostend of cotton f. They would sow lice and ection tegether.

71 Q. Do they ever put rice and cotton in one kiari. One furrow for rice and another for cotton? - They have no kiaris in my part.

72. Q. If a tank were built, would they have kiaris? They would put them in fields near the tank,

78. Q. Which would be more profitable, rice or cotton? tice is more profitable.

74. Q. (Mr. Ibbelson) - Do they grow rice without irrigition? - No.

75. Q. (Mr. Muir Maclenzie) - Are there any water-pogged lands in your village ?- No.

WITNESS No. 21 -Mr. Motibnai Bhagwan, Landowner, Amod.

9th Dec. 01.

1. Q. (The President;-Where do you own land?-In Amod taluka.

2. Q. Have you wells on your land ?- I sank a well in 19 10.

3. Q. Did you get water?- Yes.

- 4 Q. How much land have you got ! 500 deres.
- 5. Q. Have you many wells?-No, only one well.
- 6. Q. Dld you build that by laking a loan from Government!-No.
- 7. Q. (Mr. Ibbetson)—Did you get the money from n bania ?—Yes, I got the money from the sourcar.
- S. Q. (The President)—Why did you go to the sowear in preference to going to Government?—This was at the commencement of the famine year, when lukavi was not
- o. Q. Do you propose to make any more wells on your land?—Yes.
- 10. Q. Will you then go tack to the lania again? -For the last three years the sourcers have not lent money, and so . I will go to Government.
- 11. Q. You have had the experience of this famino in the last few years, do you think you would have been in a better position if you had had wells ? Yes.
  - 12. Q. Are there many wells in your taluk? -No.
- 13 Q. Are your neighbours prepared to dig more wells in the cy at of famine?—Yes.
- 11. Q. Have they begun to take advances f-They don't get a sattleient amount of takavi-
- 15. Q. What is the difficulty?—Government only alsomers up to Rs. 500, and that is not enough to build a well.
- 16. Q. How much does a well cost in your talula?-
- 17. Q. Is the water very deep?—Water is found at a resumable depth; a well must be sunk very deep in order to have water always.
- 18 Q. (Mr. 'Hile'can)—flow many roots are there in a well costing Re 2000;—51x, if water is sufficient. If not, 2
- 19 Q. (The President)-How many feet down is the mater antique?-Alant 15 hands, but in order to make the mater personal, we should go down lower.
- 22. Q. If you were a little hing of your own taluka, what well you coto make it little nitherend another familie in little with successful, talks made and a canal brought in, we all to five.
- 21. Q for their any timbs non F. There are timbs, but in we have next in them.
- 22 Q Howeve young that to got water in them in a year of heavy the Pierr thereto ex-
- 23 Q. Me. Phile 13—When you loruned mores from the form to make this well, which factored did you pay?— & z me tert.

- 24 Q. Do you know whether you will have any additional revenue assessed upon it?—When the survey revised, I will be charged something extra on account of the well.
- 25. Q. You say that the tanks were dry in the famine and did not do any good Could you dig a kachchn well in the bed?—Yes, we sank wells in the beds and grew fodder in the famine.
- 26. Q. (Mr. Rojaratna Mdlr.)-What area does the well irrigate?-Twelve acres.
  - 27. Q. How many kes P-Six.
- 28. Q. How many crops did you raise from that ?-One; there was no foother for the cuttle, and I cultivated for the sake of the fodder, but mying to the severe cold it was not
- 20. Q. Are you irrigating a larger area this year? This ear ruts have destroyed the crops, and I have not been able to irrigate moch.
- 30. Q. These two years have been rather unfurtunate; at do you not think that well cultivation will pay eventunlly ?-Yes.
- 31. Q. Could a well of six kos irrigate a much larger area than 12 seres?—In a good year it will irrigate 20 acres.
- 82. Q. You said that at the revision of settlement the assessment is likely to be enhanced: have you any idea of the probable amount of the increase?—No.
- 33. Q. Do you think that the fact of your having dog n well will lead to n greater enhancement of your land as contacted with your neighbours' lands where there is no well?—Yea it will.
- 34 Q. Do you not know that under the rules, there should not be any enhancement ?—It will be raised, I think
- 35. Q. (Mr. Muir-Mackenzie)-What is the soil of your land?-B'ack and gorat.
- 36. Q. What is the soil of the land on which the well is built?—Mirri (mixed.)
- 37. Q. What crops do you intend to grow in ordinary years ?- Juani, cotton, and veg tables.
- 38. Q. Are you going to use well water for cotton?— Cutton will be benefited by well mater during such years as
  - 39. Q. But in ordinary years !- No.
  - 40. Q. When did you build your well ?-In 1900.
- 11. Q Hes any increase of assessment been yet demanded ?- No.
- 42. Q. Are you affeed that it will be?-Not until the revision of the S-telement.
- 43. Q. Is that the general fear in the country? Some people large that fear, but there who kind say that will not be the case.
- 1t. Q. Which is the most profestle, rice or cotton?— The people of Private rice and editor together; if rice can be lerigated, they get cotton and rice as well.

Mr. Moti-bhai Rhagican. Mr. Ali Akbar. 9 Dec. 01

Snrat is an important rice-growing district. Rice cultivation is dependent ou tank irrigation, and there is a demand for water throughout the mousoon. In Breach (except the Ankleshvar Taluka, which in its agricultural features resembles Surat), there is no demand for water during monsoon. Rice requires two to three fleedings between June and October. The last flooding is most important, because it easures a good harvest of rice and n second crop of val. The distribution is controlled by arrangement amongst the villagers thomselves. The irrigation revenue is realized in the form of increased land gation revoune is realized in the form of increased land assessment and is in the proportion of 10 of land share to 4 of irrigation (water) sharo.

3. Black Cotton Soil.—Small tanks constructed in hlack soil hold water very well. Existing dams are of this hlack soil hold water very well. Existing dams are of this soil without masonry core-walling, and I think hlgh dams could be made of it, provided they are protected by yellow earth or meoram covering. Black soil emeks whea dry, hat is very rotontive when wet. Surface protection would, therefore, tend to keep it moist. As yellow and kunker soil is always obtainable at varying dopths below the black soil, there would be no difficulty in providing the surface covering of a depth of two to three feet. There is always demand for water during the mousson as described above. The area of irrigation under ouch tink being fixed, there is practically a constant and uniform demand. The assessment being also fixed, there is no variation in revenue. ment being also fixed, there is no variation in revenue. Broadly speaking, and excluding patches of sugar cane. I believe the tanks do not command other classes of soil nor trigate other crops than rice. There is a tendency on the

part of the people of Surat District to extend rice cultiva-tion from tanks, but such is not the ease in Broach. I think their extension would be very useful and romunera-

4. Government Irrigation Works.—No works of the kind have oither been constructed or are in progress in these two districts. Tapti Irrigation canal was the only work which was proposed before the last famine (1899-1900), but since then two projects, namely, "Untewn" and "Amba Pardi" tanks in the Maudvi Taluka, have been drawn up, and although every endeavour has been made to find up, and although every endeavour has been made to find out fresh tank sites, it has not proved successful. Detailed information and estimates in connection with these projects information and estimates in connection with these projects have been supplied to Mr. Bealo, specially appointed for this purpose, and I understand he havealt fully with the matter; but I give below my views regarding irrigation from the Norbudda and Tapti. Deep black cotton soil forms the bulk of the two districts. It is a well-known fact that this soil is not suitable for irrigation. Rice is the only kind of irrigated crop which at present flourishes in certain farourably situated anall areas, and it requires conjous favourably situated small areas, and it requires copious water-supply for fivoding during the meason menths (June to October) only. It also requires a good deal of manure which would not be available for irrigation of extensive areas. Cotton and juwar are the two crops which are grown very extensively. For both these crops the soil are grown very extensively. For both these crops the soil is extremely suitable, and specially so in the case of cotton, which thrives us spite of great variation and uncertainty of rainfall. This I can assert from the experience of this year, as although the mins held off since "August" cotton has not suffered to any great extent. Jowari has suffered somewhat more, but still both these cropance expected to give fair results unless the plague of rats which has already caused a good deal of damage would cause further destruction. destruction.

the danger of water-logging and consequent effect upon the lealthiness of the climate of the large areas to be brought under irrigation is also a factor which requires serious consideration. For the above reasons, and the facts that the soil is best suited to jimyat outtivation and the general immunity enjoyed by the districts from serious famines, I would hesitate to recommend the waters of Neibudda and Inpli being utilized for irrigation. The works would be very costly and of doubtful utility.

5. Provincial Irrigation Works.—We have no such works.

works.

o. District or Fillage Works.—Statistical and general information has been supplied to Mr. Bealo and I see no good in repeating it here. I should, however, like to say a few words about their usofulness and possibility of extension from personal experience. Almost every village has a tank of some kind or other from which in many cases little areas of irrigation are practised. If these tanks are carefully examined and such as appear promising are sarveyed, I have no doubt that several tanks will be found carefully examined and such as appear promising are sarveyed, I have no doubt that several tanks will be found which can be enlarged by building pakko wasts weirs or self-acting sluices at the inlet so as to raise their full supply level. A systematic and careful survey of every tank by a special staff is necessary before any defiaite conclusion can be arrived at as to the extent to which extension would be possible. I have observed that in several cases the inlet channel is overtopped after the tank is full, and in the surrounding fields water lies to a depth of 2 to 3 feet, and gradually drains off into some adjoining nallab. If self-acting sluices are constructed asstated above and water is impounded in the tank up to the highest level it has reached, I am sure the capacity could be considerably increased. Leaving aside the question of irrigation, these tanks are of the greatest value as protection against drought and easuring good drinkable watersupply to the villages. In the Broach District irrigation from tanks is very limited, but during the last famine several tanks were largely excavated and enlarged. In the menusoon before last every one of them was reported to have completely filled. In the monsoon just past they did not quite fill, but are holding very fair quantity of water. Two or three cases have come to my knowledge where water-supply from wells was formerly brookish, but last hot weather it had vory much improved. Extension and enlargement of tanks are therefore in my aphition the most useful form of protective works we have in these districts.

7. Wells.—I have supplied whatever information I had to Mr. Beale, from which report I quote below paragraph 3, which formulates my opinion about the extension of irrigation by wells.

Mr .tii .t&sr.

o Der Ol.

"Paragras 3.3—As for extension of irrigation of wells, I would not advice its being undertaken on any large scale by Government. It is a well-known fort that the black cotton soil, which forms the balk in both the districts, is not suitable for any other kind of inrightion except rice, a direct requires copious water-samply. As farmine protective works, three wells would be of trey little use either. The expense would be ent of all proportion to the good that would result. In the lack roll tracts the wells do not contain abundant supply of vater, ord in a bad year the supply to all dwindle down to such a small quantity that barely an acre could be irrigated from it. Water would often become brackish and even rall, which is useless for itrigation."

8. Desirance Weeks—All the deviance works that

8 Brainage Works.—All the drainage works that rece known to be required have been carried out with the exception of Olpad drainage works, alont the utility and desimbility of which further enquiry is necessary. There is a general impression in Branch, and I have been told by some villagers that by the construction of these drainage works the surface will, which acts as manure, has been washed away and injury has been caused to the land. But hit is a matter about which I am not in a position to form an opinion from personal knowledge.

# 9. Works executed by Famine labour .-

## Classification.

				Amount.	expended.
Name of wor	Surot.	Broach.			
Prainage channels Village Irrigation tank Rechantions Village tanks Reads, earth work Collecting metal	To	i		R4. 454 2,41,016 22,511 312 2,61,135	Re. 1 07,554 2,77,460 1.01,413 18,64,556 98,335 12,161

All the works which remained uncompleted at the end of famine and which it was considered desirable to complete, have since been either completed or are in progress, and produced the advantages which have account from the village tanks in paragraph 6. In every ease tanks filled up to F. S. L. in the mousoon of 1900. Absorption was rather rapid in the first year, but it has reduced this year.

10. Programme of Relief Works.—Revised finnine programme lies been published which gives detailed information.

I summarise the figures below:

it will be derror that for k execution is the principal from making, more and that the make me well distri-tuted. The appraisance can be extended with even when

required, as an estimate for took excavation takes very little time to prepare.

## 11. A .- třeneral.

1. Strai and Bronch Districts.—I have been in charge for the last three years, and had to make arrangements for the supply of water in the famine.

2. The average rainfall Is as undec: -

- 4. Unsuitability of soil has alcendy been discussed in replying to the Memorandum of Points, paragraphs 3 and 4.
- e mnot be grown.

# B. and C.

We have no such works.

# D.-Tanke.

- 23. (1) All the tanks in the Surat and Beorch Districts get their water-supply from the rainfall on the catchment aren.
  - (2) By pipe outlets through the dam in different parts.
- (3) The supply is required from June to October. In the years of amplo sainfall it is sufficient; hot want of water is felt towards the end in years of scanty rainfall.
- (1) The variations in the seenes irrigated from tanks are very great. The area varies necording to capacity of the tank, the area commanded and whether the tank is used for dorrestie purposes or not-

An average imigation tank iccigates about 40 acres.

- An average irrigation tank needs to be standard of acres.

  21 I can only answer these questions rangilly. The principal unirrigated erops grown are juar and ectton, itsee are grown obtenuately and their value is, juar Rs. 15, cotton Rr. 25, or an average of, eay, Re. 2) per nere. Assessment being Rs. 3 to Rs. 31. Rice is the principal irrigation crop from tanks, and on its leing cut, and is seen after October. The yield is Rs. 37 for size and Rs. 13 for eat, or a total of Rs. 50 per acre. Enhanced as a sment on such lands averages Rs. 14 (Rs. 10 land share and Rs. 1 irrigation or mater share), and is collected by the Revenue Department.
- 26. The only instances I know are en all areas of sugar-cause in the Jalalpoe and Bulear Talubas of Surat to itees, where water is supplemented from wells after the tanks are C":-D"F.
- 28. The owner of the lard pare revenue to Government. The amount, elembertated in paregraph 24. The enlarged rate of a securent legal on the total area of the holding and is not dependent on the six a security ineighted.

Mr. Ali Akbar. 9 Dec. 01. So. The tanks are all in charge of the Revenue Department and are only periodically repaired on a requisition from the Collector by this department. The expenditure is confined (except under special sanction of Government) to 10 times the irrigation share and subject to condition that the villagers contribute 10 per cent, of this amount. The system is working well. The question of enlargement and extension of irrigation I have dealt with in my former report.

83. There is no doubt that slow eilting of tanke is going on, and consequently the capacity is being reduced, but there are no statistics of accumulation. There is no custom of regularly removing silt, but excavation is made at the time of periodical repairs to the extent required for repairing the bank.

## E .- Wells

The average depth varies from 40 to 60 feet, but observations are boing taken in different parts of the districts.

- 1. Q. (The President.)—You are Executive Engineer of the Districts of SarAt and Brosch?—Yes.
- 2. Q. How long have you held that post?—About  $3\frac{1}{3}$  years.
- 3. Q Were you in these districts throughout the famine ?—Yes.
- 4. Q. Can you say roughly what was the loss of population during the famine?—I cannot say.
- 5. Q. Is the country in Broach not indepted to the formation of tanks?—We cannot get water by flow from tanks so easily as in Surat, owing to the flatness of the country.
- 6. Q. Is the country flatter in Broach than in Surat?-Yos.
- 7. Q. What is the procedure in Surat, as regards repairs of tanks?—We generally take up the tanks that are in want of repairs in the order of their importance; those that irrigate a large aron we take up first.
- 8. Q. You have not an establishment sufficient to go round and inspect them?—No, the tanks are in charge of the Revenue Department.
- 9. Q. A tank might be in very had order and you might not hear shoat it t—I should think the villagers would very soon tell the Collector.
- 10. Q Did not tanks do good during the famine?—Rice was grown under them, and in soms talukas there was material good done; in places where there was not safficient minfall the crops died.
- 11. Q. Did they turn to the wells to help them ?—Not in the irrigated area but in the tank bed itself, kachcha wells were dug and fodder crops grown to some extent
- 12. Q. You say "there is a tendency on the part of the people of Sorat District to extend rice caltivation from tanks, but such is not the case in Broach. I think their extension would be very remunerative." You think there are places in Broach where tanks should be made?—That is my impression.
  - 13. Q. Has no survey been mado?-No.
- 14. Q. Will you tell us comething about this tank at Broach that we saw?—For the last 20 years there has been a question of the water-sapply to Broach from the Nerbuda and also from wells; this project was first thought of by Mr. Fardunjee, Executivo Engineer, who was for a long time in this district. He was here before the famine and got me to level the ground; we saw that there was a great deal of work wanted, we wanted a large central work for the famine and had no alternative, so this survey was hurriedly commenced.
- 15. Q. There has been no mistake about the levels?—No, but the revenue prospects and details were not considered earefully.
- 16. Q. Did the Collector, Mr. Cedell, approve of it?—Yes.
- 17. Q. Did the people themselves show any interest in the Broach receiver ?—No.
- 18. Q. There was no idea of irrigating from the tank?—No. It was intended for the water-supply of Broach, we could not make it sufficiently deep, the original project was for 20 fest of water, after percolation 15 feet would remain that was om-idered sufficient for supplying the low-lying parts of Broach.

The cost of a pakka well having steining of burnt brick and lime masonry is from Rs. 500 to Rs. 1,000, and its diameter from 6 to 10 feet; kachcha wells are not practicable and seldom found anywhere.

The wells of the kind described above are so limited and so little irrigation is practised from them, that it may be said to be a negligible quantity. There are certain limited tracts of what may be called natural bagayat lands where foreourable condition for well irrigation exists. There is copious supply of water at the shallow depth of about 26 feet, and a well of 6 feet diameter can be constructed at a cost of Rs. 300 only, and would irrigate from 2 to 3 acres of sagar-cane or garden produce. Such areas of bagayat lands occur on river eides and near nallah, and cultivation in them is intensive and requires no help from Government in the way of construction. The bagayat area of the kind mentioned ulove is extremely limited and does not affect the general question of well irrigation.

The question of extension of irrigation by wells I have already dealt with in my former report.

- 19. Q. It will hold water in 'au ordinary year?—After precolation and evaporation there will not be more than 3 feet of water, and that will not be sufficient for the water-sapply scheme.
- 20. Q. If you had proper outlets, would there be any demand for water for markets and gardens?—Yes, that is my impression after talking with people about it.
- 21. Q. How much money would you require?—Rupeee 8,000 would do it.
- 22. Q. You do not think that there would be an advantage in employing the watere of the Nerbudda and Tapti for irrigation?—I cannot say I have studied the question, but that is my impression.
  - 23. Q. Owing to the nature of the soil ?-Yes.
- 24. Q. Has any estimate been made of the cost of a curvey for sites of small tanke?...No, I have not done any surveys,
- 25. Q. Would you carry on each works before the famine came or would you leave them till then?—They would not be suitable for famine labour; they should be done as ordinary worke. Tarks are the best form of protection. I would improve existing tanks by providing slaices. This should be done at once.
- 26. Q. You say "all the drainage works that were known to be required have been carried out with the exception of Olpad drainage works, about the utility and desirability of which further enquiry is necessary." Have you worked out the Olpad project?—Yes, in detail.
- 27. Q. What is the estimate, roughly ?-I cannot remember.
- 28. Q. Have you may doubt about the benefit of it?—If we drain it slowly, as we propose, I think it will do good.
- 29. Q. What is the slope of your drainage obaunel?-1 in 1,700.
- 30. Q. You say the feeling is against carrying out the work ?—Yes, some villagers have asked me to apply to the Collector to prevent it being carried out.
- 31. Q. Why is that?—There is not safficient water, they want more.
- 32. Q. Supposing you put a sluice in the drain, won't that help matters?—Yes, but it would be a little more costly perhaps, as we have only one bridge.
- 33. Q. Would the drains remain full for very long?—At the worst perhaps four days; they are designed to carry off I inch of rain per day.
- 34. Q. You say that "the tauks filled up to F. S. L. in the monsoon of 1900"?—Yes, I particularly referred to tauks excavated at the famine time.
- 35. Q. They did not work?—They did not quite fill but they did some service, please see section 6 of my note.
- 36. Q. Do you know of any places in your district where water should be stored on a large scale?—No, before the famine we had a connoil consisting of the Superintending Engineer, Commissioner, Collector and some local authorities like the Hon'ble Mr. Chuni Lal, and tried to find works of that description, but no one could enggest any; the flatness of the country is against it.
- 37. Q. (Mr. Higham.)—Would it he may good to have a carvey of the country in greater detail with a view to finding sites for big tanke?—I don't think we chall be able

to End many sites of that description; by big tanks I mean such as have dams of some beight.

- 89. Q. You propose one tank in Surat? Two.
- SP. Q. One of them has been surreyed?-Both have been surreyed.
  - 40. Q. Have they been sanctioned!-No.
- 41. Q. What will they cost ?- I think one will cost a little over Ra 3,64,000 and one about Rs. 1,00,000. They are alternative schemes for one and the same tank.
- \_ 42. Q. What will they hold, roughly ?-350 million cuble lect in good years.
- 43. Q. Is that the only project you have been able to recommend?—Yes.
- 41. Q. It is no use surveying for more?-No, you might
- 45. Q. I don't understand what you want a survey for, what is the point?—We want to find out to what extent we can raise the full amply level and improve existing
- 46. Q. (The President.)—You merely want an accurate plan of a tank before you begin work upon it?—Yes, we have no information at all as to the drainage area, centents, cie.
- 4". Q. (Mr Higham.)-I suppose you know how high the tanks are filled, it seems to me that much time is masted in making anyreys, the object of which I don't understand; either the dams are too high or they are too low, cannot you raise them or lower them without making a survey?—These surveys won't take long, perhaps two or three days at the most.
- 49. Q. In regard to drains, von would limit the run off to one inch in 24 hours. Would not that be too fast; the complaint is that these drains take off too much water in dry years when you want the water?—One inch would be too fast to take off, if we wanted to stop it we would put in a regulator; in present these areas, which we propose to drain, are very much water-logged. The cristing drains were not designed for any particular run off. With security miniall perhaps one such per day would be too large.
- 40. Q. You propose to make regulators?—I have not been able to form a definite opinion.
- to. Q Why cannot the people control the water them-selves; don't they have banks running through their fields?
- 51. Q. The complaint is that the water carries off the surface soil, a regulator won't stop that, it seems to me that the only plan is to hold the water in the field by bank until they get what they want?—Yes, no doubt.
- 52. Q. Cm the engineers stop the drains being too effective?—We can stop the flow by regulators, this would check the water golug into the drain.
- 53. Q. How deep is the drain below the surface?—Two to 3 feet; further down, out of the water-logged area, it is deeper.
- 5t. Q. Could you not hold up the water by hunds f-Yes it would require an establishment; we would require establishment for regulators too.
- 55. Q. You have designed some new drains, are they going to be constructed?—The project has not been designed yet, none of the Revenue Officers have been asked yet about it.
- 56. Q. With regard to the Tapti count, is there room for both the causal and drainage works, wou't the causal interestly the present water-legging i-It probably would.
- 57. Q. Yen say the Brosch tank was made for the enter-spels of the lown; is there any reason why it cannot be deepened to the depth to which it was originally designed?

  Yes; if Impressantic work was required; no doubt they would require to take the water out of it, that is
- f.s. Q. It was designed to be 12 feet deeper than it is no pre- note. Yes.
  - 59. Q. What is the soil ?- Yellow clay-
- (9) Q. If you went on, you would not get through the clay letters !- No.
- 61. Q. Is it ere any ites of continuing operations?— Only in the case of a large famine.
- ey. Q. If cleared to its fail depth, would it be sufficient for the mater-supply of Breach !- Yes, it is calculated that

- 63. Q. Sapposing you have a der year î-It would leve sufficient water for the next year.
- 64. Q. You have spent nearly 10 lables on these tanks in the Breach District. This tank in Breach cost only 4 to 5 lakl as - You
- 65. Q Where are the other tanks?—There are about 27 tanks in different parts of the desiriet.
- 66. Q. None of them were intended for irrigation ?-Very fem.
- 67. Q. They are village tanks?—They are only for domestic supply, on a few we hope some initiation will be possible, but they are small.
- CS. Q. You could not find irrigation tanks in Breach?—No, they are below the ground level, they are simply hollows in the ground and would require lifts.
- 69. Q. You could not find sites for flow irrigation?-
- 70. Q. (Mr. Ibbetson.)—How long have you known these parts?—For 3% years.
- 71. Q. Do you work the 10 per rent, contribution unle in regard to the rep dies of private tanks ?- Yes.
- 72. Q. Supposing a village does not give 10 per cent. ?

   Wo submit the papers to Government and very often the Collector gets it from the Local Fund.
- 73. Q. I cannot onderstand about the survey for new sites for tanks, I understand no sites are available for blg tanks; putting that a-lde, do you recommend new sites for small tanks?—I blink enlarging of existing tanks would be more useful.
- 74. Q. You don't think it would be worthwhile to look for sites for new tanks?—No.
- 75. Q. Rice is grown without Irrigation?—No rice is grown, except when it is mixed with cotton, then it is grown without Irrigation. I believe in Broach there is rice mixed with cotton on dry areas, but only in limited areas.
- 76. Q. You say that sice requires a good deal of manure which is not available, and that this limits the extenden of cultivation; is rice never grown without manure in these districts, or do you mean that without manure rice won't pay a water-rate f—The crop would not be worth growing.
- 77. Q. Is there any rabi grown in these parls besides the second crop on rico land?—Cotton only.
- 78. Q. No wheat or barley f-I don't think so.
- 79. Q. As regards the improvement of the small tanks which you propose, do you think Government would get a return on the money spent?—Yes, certainly; If we increase the water-supply, they will grow caue.
- 80. Q. Would you get more revenue from that?-
- 81. Q. Would you bring new land under irrigation ?not be the ease.
- 82. Q. You would only improve the supply to the existing area  $\hat{r}$ —Yes.
- 83. Q. Would the Government get extra revenue suffi-
- 81. Q. With reference to what you say in paragraph 21, we have been told by some winers that the eredit allowed to water is not sufficient?—I think it should be larger.
- S5. Q In the case you quote, do you think that instead of taking 11s. 4 out of 18s. 11 as the irrigation or mater share you might take Rs. 10 out of 18s. 14?—Yre. Re. 10 as irrigation share and Rs. 4 as land share in order to be fair.
- 80. Q. There are a pumber of small tanks which Government cannot put into order; supposing Government made over the water revenue to Israel Boards, could three put the tanks into order?—Yes, if they got a better professional ertabliel ment.
- 57. Q. Do you think that the agency could be improved?—I should rectainly profer that they should to done under the experision of the Public Worls Depart-
- ES. Q. Supposing Gorernment said these tanks are too small for us to repair; rather than let them po altogether, would it be a prof thing to use the aponcy of Local lioures; if they were given the revenue, notif they do the work fairly well!—Yes.

Mr Allar.

9 Dec. 01.

89. Q. Is there any hope of golting the people to do it Mr. Ali Akbar. themselves P-No.

9 Dec. 01. would do it better than District Revonao Officers?-It means it would be nuder the District Revenue Officers.

91. Q. (Mr. Ibbetson.)—I understand that there has practically been no famine in Surat ?—No.

92. Q. In Broach?-There was bad famine there.

93. Q. Are you supposed to keep ap a famine programme in Surat?—Yes.

94. Q. Is it ready ?-Yes.

95. Q. You state in your programme the number of people for which labour is provided, have you may standard with which to compare that number, to see if it is sufficient or not?-That is kept by the Collector.

96. Q. Have you maps showing the distribution of works ?-Yrs.

97. Q. Are they printed ?-No.

98 Q. The works might all be in one corner of the taluka: - Perhops, but the talukas are smell.

99. Q. Does your programmo inolade village works ?-No.

100. Q Why is that?-- The village programme is kept by the Collector.

101. Q. Do you know unything about it ?-The Collector selects the village tanks and estimates are got out.

102. Q As far as famino works go you are ready ?-

103. Q. And the larger public works schemes are ready?—Yes.

101. Q. (Mr Rajaraina Mdlr.)—I was told at Bronch that the level of the town is much higher than the level of the tank. Is that correct?—Some parts are.

105. Q. The greater portion, I was told?—About one-third at least is lower, we could give water by flow if we had

106. Q. Two-thirds of the town would require it to be pumped ?-Yes.

107. Q. Considering the nature of antrounding soil (black outton) will not the tank get silted up soon; and what area will it irrigate in its present condition?—The tank will not silt up so rapidly, it would irrigate about 600 areas by lift, not by direct flow.

108. Q. Could you pump water in that soil without reservoirs and filters?—Wells would be made and it would be pumped from them to prevent dust getting into the pumps-not deep wells.

109 Q. How many millions does this reservoir held ?-21 millions.

110. Q. What is the area under rice in Surat?-11,000 acres, the total irrigation is 125,0 30

111. Q. Has there been any appreciable increase in the rice area in the last tea years?—No. I don't think so.

112. Q. You said in reply to Mr. Ibbetson that two or three days would suffice for the survey of each tank?— Yes.

113. Q. Is not the existing staff capable of carrying out and a survey?—Our establishment at present is just saob a survey?—Our establishment at present is just onough for ordinary works; it would require good trained men.

114. Q. Ovorscers would be sufficient?-Yes.

115. Q. You also said in raply to Mr. Ibbetson that the return on some of the works oven after repair would be very little; supposing Government derived no increased revenue from these tanks, would you not still advocate their thorough repair to provent further detorioration?—It would be a useful work.

116. Q. Apart from famine considerations, considering the present condition of the tanks ?-Yes, I do not

recommend these repairs only; but extensions and enlarge ment of the tanks.

117. Q. Do you think it would be economical to pump water from the Norbudda and supply it for purposes of irrigation !- I think it would be too costly.

118. Q. Supposing masonry banks were constructed for the erection of mots, would that he cheaper ?-I think it would cost a great deal.

110. Q. What is the rise of the Norbudda on the averago ?- 10 feet, there is a difficulty about salt water.

120. Q. Does the tide go high up?-About 10 miles nbovo Broach itself.

121. Q (Mr. Muir Mackenzie.)—Do you believe rice cultivation could be largely extended in Broach by means of tanks?—At present the cultivators are not inclined to do it. if a good sopply of water were given, they might be induced

122. Q. Would it be more profitable than cotton ?-I cannot say.

123. Q. You say "the area of irrigation under each tank being fixed, there is practically a constant and uniform domand." Do you mean that a larger area might be irrigated by tanks?—In some eaces it might be.

124. Q How do you mem it is fixed? - The water is only given to a certain fixed area.

125 Q. (The President.)-Do you mean if a tank one year had twice as much as another, the area would still be the sate P - Yes, the surplus water is used for domestic parposes.

126. Q. (Mr. Muir-Maclenzie.)—Are there many other sites on which tanks could be made?—I don't think there are.

127. Q. I mean as regards Sarat as well as Broach?-

128. Q. Do villagers semetimes apply to have now tanks made ?-No.

129. Q. I heard of an application the other day ?-Each cases would be very rare.

180. Q. (The President.)—Would the people in Surat like more?—They would like better tanks.

131. Q. (Mr. Muir-Mackensie.)-You don't think it would be worth making a survey to find eites?—I don't think it would be possible to find many sites even after a survey was made.

132. Q. You gave me the impression that you thought most of the rice irrigation was under tanks, but there is plenty under Akushia ?- I dea't know.

133. Q. In Chikli there were at the original survey 8,221 neres of rice, do you believe that that is almost all under tank . ? — In Chikli taluka the vircamstances are posuliar; I only refer to irrigation rice.

194. Q. In Bronch it is true that except under tanks there is very little rice except when mixed with cotton?— Except in Anklesar there are many places in which rice nnder min water is grown.

135. Q. Do you know if any advantago might be derived in water-logged areas by meking tanks within them and leading drains into these tanks !—Yes.

196. Q. (The President.)—Do you think the levels would admit of that?—It would be simply excavating a hole in the ground.

197. Q. (Mr. Muir-Mackensie.)-De they lift water from tanks here ?-- No, except for sugar-cane.

138. Q. Do these drains silt at all !- Yes, when there is back-water in the stream iate which they fall.

139. Q. You know nothing of the injury to the surface soil?—No, I have not seen it, I have only heard of it.

# WITNESS No. 26 .- DESAI DULABHRAM SAMBHURAM, Laud-owner.

Answer's to Frinted questions.

Paragraph 2.- I do not know the area of oulturable Mr. D. D. lands in eacu district. This can be obtained from the dis-Sambhuram. trict records. As the rainfall is deficient in Gujrat, the orops do not grow properly. Rice crop in husk requires to be irrigated. Rice crop requires at least water five times. 9 Dcs. 01.

The rain should fall in the months of Akhad, Shravin, Bhadeiva and aso at intervals for the rice crops. Revo-nue is not recovered as there are no irrigation works.

Paragraph 3.—Small tanks excavated in black soil cannot hold water. Block soil does not require to be irrigated,

ere le sufficient rain. Goraf frud can le bester be as sicre is some at van. Goral and can be bester benefit all by irrigation than the Black sol. If there is sufficient trainfall the owners of the Black soil do not require irrigation. But if the sain is not sufficient they require the all of irrigation in mising their crops. Tanks excavatal in Pack-soil do not hold water. Tanks in such lands should be excavated very deep and when the held becomes solid it bolds water.

- 4. Now the irrigation works are not going on in this di-trict. It would be beneficial if in the famine year there werhe are up ned. The water of the river Nerhadah be-cemes I rackish as far as Sakaltirath and beyond that the water of this river remains always aweet. It a channel to from the grace where the water rumains always aweet, or if the unter be brought from the Inpli river herigation works can be alrantageously utble d. There are re other big averaged leafing there were. I have not the presents of conone control of orought from the Inpli river lifterion works can be alrandageously utilized. There are no other big rivers levide, these two. I have not the neconits of cost focus red after repairing the irrigation works. These can be had from the Taluka Officers.
- 5. tire lands near old trinks have strendy been charged finavat: hence no other assessment is levied. I do not Illiunyat ; hence no other assessment is levied. Illimight; hence no other necessiment is levied. I do not know of any increase in revenue owing to the construction of registron works. If higher rates are levird on tanks to be a nativited henafter the people will feel them to be a burden. Provincial founds should be utilized in constructing inigation works; or new works may be built at fimp rial expenses. Provincial vates are insofficient to meet such expenses, Government money may be used for the
- G. Village and district works me executed by the Civil names or by the Public Works Department and the works are supervised by the Revenue officers. I have no records to show how much land depend on these works and how many such works are la existence. The nateracter is according to the original settlement credited to Government Revenues, and hence these works should be constructed at the expense of Government. Government has not to spend monog every year. People upply to Government when their village tanks are silted up and after due enquiry Concernment repairs or despens such tanks. Government do not semit the water-inte even if such necessary repairs are not made. Tanks and reclamation works have been done in the Lamine year, and I know not of other works. Such works were not undertaken by private individuals but they were made by the District Beard. Government should undertake the works for which they realize the water-intes and the District Beard should provide money for the tank which are used by the people for drinking water. I do not leave the works are constructed for the hence of the people they are such as the constructed for the hence of the people they are such as the constructed for the hence of the people they are such as the constructed for the hence of the people they are such as the constructed for the hence of the people they are such as the constructed for the hence of the people they are such as the constructed for the hence of the people they are such as the constructed for the people they are such as the constructed for the hence of the people they are such as the constructed for the hence of the people they are such as the constructed for the hence of the people they are such as the people they are such as the constructed for the hence of the people they are such as the people they are such as the constructed for the hence of the people they are such as the people they are the people they are the people they are the people they are they are they are the people they are they are the peopl then me suce to be pleased. If responsibility for such works note put on the people, nothing out he done or will be done. People cannot undertake such works.
- 7 I do not know the area of lands brought under cultivation in the ordinary years and in the famine year.
- I have an records to show the number of new wells con-structed each year during the last ten years. Government advanced a may to the people to emitted wells but I have no accounts to show the exact amount infranced. It is adno accounts to show the exact amount ulranced. It is advantaged to spread money in constructing wells in the lands fit for Begreat. During the famine very, i.e., 1809 to 1901, people managed to die Lacheho wells. I do not know it oid wells laving been required. Water can be found in the village of Diva, Divi, Survadi, Samut, Andada, Chlangra, Maladeway, Andheda, Chlangra, Maladeway, and Chorasi at a depth of 20 feet and the nell about contain 10 feet of water, and thus the total depth of the well can be fixed at 40 feet. In other rely transcription in the well can be fixed at 40 feet. In other villagies water can be obtained at n depth of 30 feet and the well chould have in it 20 feet of water, and thus the total depth of the well can come to 50 feet. The cost of n well having one descent rome to 10, 100 and a well of the lost 10, 700 and of feat Let Re. 1,000.
- 8 Line wife win rules the lew lying lands underlegged and by the increasest flow of nater the land is nealed
  away. Oralisms works are required at a few places.
  For such marks Generic ment should purishe money for improving the lands. Increase in Government revenue can
  be node by bringing the waste lands under collisation;
  and if the land is true from being unterlegged, the conworld thine and the Government revenue can be realized.

  By I have no records in about the mandation of model and
- b. I have no records to show the number of noths under-It has no records to show the number of not a under-taken do ing the familier year. Analoshan tank was ex-exacted doing the last tamine, but no 'Orata' his hom-erretracted and hence the people experience sone list's distriby. Isophe are benefited by this tank. Oning to the creation of the tank it he'ds water and consequently the people and eather have supple mater to creak.
  - 10. I do not in v.

Mr. D. D. Surfaces. II.1. The following answers are applicable to the Breach D Dec. 01.

I have served as a taleti for 43 years, and by experience

- 2. From January to the 16th June the rainfall is very slight and from 16th June to 70th June the rainfall is 10 inches, in July 20, in August 10, in September 8, and in October 4.
- 3. There are obstacles enumerated from 1 to 8 in the extension of irrigation.
- 4 I know of no man excupled from enhancement of neeestment of water-rate for the irrigation work constructed from private funds.
- 5. People do not take loans freely for the extension of the irrigation.

Reduction in the rate of interest, remission of interest can-Reduction in the rate of interest, remission of interest can-not induce the people to extend irrigation, if partial remis-sion is allowed onloof the sum advanced, wells may be dug in lands which are fit for Bagayat. But in case the water of the well turns out to be brackash, the expense should be borne by Government. Period of repayment of insulments should be extended by accepting a fit person for the surety. I do not few that the extension of irrigation will injure the remaining enlitration by drawing enlivators to the irriga-ted tracts. I know not of having noch a case occurred previously. previonaly.

## D .- Tanks.

- 23. I. The tanks are filled in by rain water.
- 2. Kiari lands are sown with rice crops. Water in filled in the kiari lands by enting a small channel from the lank. If the water in the tank in not sufficient for a flow by channel, cultivators use pots for supplying water.
- 3. If a rainfall is scanty the water would last for four rouths of the monsoon, and if the tank is dug very deep the water may last for eight months. In large tanks the water would remain for 12 months. In the faunte year the rainfall being scanty tanks would not hold any water; but if any does find its way into the tank, it would last only for a month or two.
- 24. The assessment on irrigated lands can be raised by
  - 1. By gelting two harvests instead of oor, the new ray ment can be raised by Rs. 2.
  - 9. Valuable grops cannot be raised in black soil. Corton, jour and wheat can be sown in the black soil, and therefore no enhanced assessment can be levied.
  - 3. In n year of numbe minfall, seanty minfall or drought no increase in yield can be obtained, but timely minfall would bring the proper burvest.
- 25. Late rounmencement would not being a proper harvest and may affect the outcome. Furly commescement cannot have such an effect and may be useful.
- 26. If a land is irrigated by means of water from the well and in a tract in which sufficient and timely rainfall has moistured the land, the harvest according from the land nutred by rain would be superior to the irrigated crop.
- 27. On the average, in a normal year or in a year of drought, the increase per acre of irrupated lands would couse to 18s. 20 ha a year of ordinary rainfall as also in a year of drought.
- 28. The coltivator and the owner of lands together would pay Rs. 2 more per acre per aunum.
- If the owner of the land pay the increased rate he would recover that amount from his tenant.
- The erbaneed water-rate in I-vied in the ardinary year or in the year of drought without regard being has for the actual area irrigated. The water-rate is fixed on the land and that is recovered.
- 23. The owner of the land incurs the expenditum required to the fie'd and in some cases the tenant if the condition is included in the" Ganotpala".
- 27 The expenditure on the exercation to the tank is as the expenditure on the exerction to the tank is lotte by Gorramont and the reciple having (kisti) the land percents subscribe a part, but the greater part of the superse lei crose by flowtrument. Begains are not required entry year, and Gorermann repairs the tanks of the layers apply for it. It is not possible to accertain the approximate supmal cost per sore.

Mr. D. D. 31. If a tank is coastructed by a private person he may Sambhuram. charge to others whot water-rate as he likes, and I know of no quarrel having taken place to this respect.

9 Dec. 01.

- 32. No privato person can construct tanks if onconraged or assisted.
- 33. Tanks are not cleansed every year, nor are they excevated every year. The tank should he deepened 3 feet deep. Government excavates or repairs the tanks. People cometimes deepea tanks hy manuel lebont. I know of no case occurred where the whole tank was cleansed after it was once filled in with water.
- 34. The Brosch district comprises of five talukas and one Peta Mahal. The names are Broach, Wagra, Amod, Jembusar, Aukleshwar and Hansot Mahol.

The average depth of permanent wells in Ankleshwar Tulnka varies from 40 to 50 feet and in Broach and other talukos it varies from 60 to 70 feet. The water in many of the wells is sapplied from springs, and water thos eupplied lasts for a long time. The water supplied by percolation does not last long. In ordinary years the weter of the wells does not become saline, and to the famine years the water fails and becomes saline.

The cost of the well having one kos would come to Rs. 500, Rs. 700 for two kes and Rs. 1,000 for more. A well can be constructed within two to foor months. If a well is excavated deep and if good springs would be reached, weter would be abundant.

A well having 1 Los can irrigate 1 acre of land and a well of 2 kos eac irrigate 4 acres of land. That 1 kos irri-

- gates 2 acres. I bave no record to show the average area irrigated in one year.
  - So. Vide answer to paragreph 24.
  - 36. Vide answer to paragraph 27.
- 37. I have no record to show the approximate average annual rate per acre paid on account of irrigation. It will be known from district records. The coltivator pays to Government as weter-rate what additional produce he gots by irrigation. The loud under a woll is charged Himayet according to a certain rate per acre, and the rate is levied from the whole whether the whole of it is irrigated or not dariog the year.
- 38. Difficulties are often ecconatered in finding out water spots; hesides without reaching water it caunot be determined whether there will be sweet or brackish water. Similar difficulties are experienced in constructing the superstructure. I do not know of assistance or advice being given in this respect by Government.
- 39. In private property it is not necessary to construct well without the permission of the owners,
- 40. In a famine year temporary wells can be excavated and by these temporary wells barvest can be reised.
- 41. It is proper to lovy some water rate from wells constructed in Begayat lands in case of insufficient rainfall. Wells should be got constructed by advancing taken to rayats free of interest and repayable in instalments. If jirayat land is thus converted into Bagayat land, it should be settled whet rate to levy on such wells.
- 1. Q. (The President.)—(Through an Interpreter.)—Are you a landoweer?—Yes.
  - 2. Q. How mach lond do you own?—About 200 acres.
- 3. Q. Is your land irrigated or not?-1 have got lend in two places which is irrigated, and the other lend is jarayat.
- 4. Q. Are your lands irrigated by wells or tanks?—By wells.
- 5. Q. Did you lose your crops in the last famine?—Yes, in the jarayat land the welle dried ap-
- 6. Q. Was there much loss of life in your village?—Yes, and of cattle also.
  - 7. Q. You have only two wells?-Yes.
- 8. Q. Did you get any benefit from them ?-I was able to produes vegetables.
- 9. Q. How much did you irrigate from these wells ?— One nere and sixteen guntas.
- 10. Q. Could you not do more than that?—Under one well I have only that much land.
- 11. Q. And under the other well?-I have planted fruit trees.
- 12. Q. Have you envintention of extending the namber of your wells?—They would be useful in gon at land, but not in block soil.
- 13. Q. You have no black soil?—My land nader the two wells is gorat.
  - 14. Q. Have you any other gorat lead ?-No.
- 15. Q. What would you suggest should he done to prepare the country to resist another famine?—We should have tanks in the black soil, and there should be sufficient water in them to enable rice crops to flourish.
- 16. Q. Havo yon ear sites in the village where you can dig tanks?—There are tanks, but they are silted ap.
- 17. Q. If they bad not been silted up during the last famine, would you have got any water in them?—There was no rain and so there could he no water.
  - 18. Q. They did not do much good ?-No.
- 19. Q. Do you thick it is any use sinking wells in black cottun soil?—No, of no use.
- 20. Q. Connot juari he raised on black soil?—If there is rain juari prospers on black soil.
- 21. Q. If there is no rain cennot juari be irrigated from wells?—If there is a small rainfoll then it ceaned be irrigated from wells, because the wells are not full in October if there has been little rain. In block soil a good deal of weter is required, and there are very few wells which could give a safficient quantity of water to irrigate it.

- 22. Q. (Mr. Higham.)—Did you lose any cattle in the famine?—Very few, I let the laod to othere and did not own the outtle myself.
- 23. Q. You do not cultivate your land yourself, you lot it oot?—Yes,
- 24. Q. (Mr. Ibbetson.)—When did you construct your wells; in what year?—One well was made by my ancestors; the other well was sank about ten years ago by a tenant to whom the land was let on a lease of 40 years.
- 25. Q. Was that before the settlement survey or after ?—After the survey.
- 26. Q. No assessment has been paid as yet on account of the wells?—No.
- 27. Q. What assessment do you expect in the next revision of settlement?—To the best of my belief an assessment will be charged for the welle built by me.
- 28. Q. (Mr. Rajratna Mdlr.)—Are you aware that your land will not be liable to enhanced assessment in the general revision?—Yes, hat the cultivators are afraid that the assessment may perhaps be raised on those fields in which there are wells.
- 28. Q. As regards takavi from Government, do you think that the present terms are very liberal—the rate of interest 5 per cent. and the period of re-payment 20 years?—Yes, they are liberal. When a well is sunk and the man gets good water then he should be charged, and Government should take the whole amount back from him, hat should the water be brackish then Government should forego the amount.
- 30. Q. Would you recommend any farther concession? If Government charge water-rate then the people should be given some coacession in interest.
- 31. Q. Only if they are charged water-rate and not otherwise?—If the water found is brackish, then the whole amount should be remitted.
- 82. Q. Would you recommend any extension of period beyond 20 years?—I think that is not necessary; the money might be lost.
- 33. Q. Do you recommend a reduction of the rate of interest from 5 per ceot.?—I do not think it is fair to charge interest as Government derive benefit.
  - 34. Q. What beacht?-They levy a water-rate.
- 35. Q. If they do not levy a water-rate at all?—Then 5 per ceot, is quite fair.
- 36. Q. Do you mean that a water-rate will be obarged at the next revision of settlemoot or a special water-rate when the wells are built?—If, at the time of revision, the assessment is to be raised than the caltivators ought not to

be charged interest; but if the assessment is not called then interest might be levied at 5 per cent.

37. Q. You say that the terms, as they are at present, are liberal enough, then why do not the many take advances of taken and extend their will irrigation?—At present they have got no manure and no extile, and their mesons are not such that they can irrigate lands from wells; so what is the use of taking taken.

38. Q. You say that under one—them have been approximately and the meson of taking taken.

33. Q. You say that under one well you have no acre and a quarter, and that you have no further orea to irrigate;

would the neighbouring recats take unter from your well. Mr. D. D. and pay you for it i-1 would charge from Its. 2 to Its. 2-8 Sandhuran. per acre for the water. 9 Dec. 91.

39. Q. (Mr. Mair Maclessie.)—If you were to berrow money for a well, what into of interest would you have to pay to the Louis !—I'rom it to 9 per cont. per annum.

40. Q. Have you heard of people getting money fam the basis at from 3 to 1 per cent.?-No.

## Witness No. 27 .- Mn. K. R. Desat, Assistant Engineer, Broach.

## Answers to wrinted enestions.

Answers to prin

No. 3.—Vágra and A'mod Tslaksa and a greater portlan
of the Braz-h Täluka posess black roil. In Jombusar Tslala we mestly neet with yellow sail. The black soil of the
district is considered rich ection soil and the general opinion
is that it is unentable for irrigation. Cottom, rail, jumăr,
wheat etc., require but little rain and heavy rainfall would
ap it the crops. Black soil teing very resentive, it is probable that roots of plants would rot and, so long as people
stick to the kind of crop now shown, no irrigation acheme
can te worked successfolly. Area under well-irrigation in
black soil is certainly very small. Even vegetables are not
sown to any great extent by well-irrigation in black soil.
These facts tend to show that black soil is unmitted for trrigation and that is the general opinion. Jerigation is, however, practised on a small scale from village tanks even in
black soil. They generally grow rice, and this foct makes
one think a little before necessing the general conclusion
mentioned above. It is probable that with manno and
plenty of water the soil undergrees a clange und ndepts itself to irrigation. In the fifth mile of the Broach-Jambusay load one can see a small patch of garden land in black
soil, where usage and jambul flourish equally well. The
depth of water in wells und in mony finstances salts dissolved
in water seem to come in the way of well-irrigation, and
I do not think that the defect lies in the soil. If good
sweet virer water can be obtained fer irrigation, I think it
can be utilized even in black soil with profit. Small tanks
constructed in this soil bold water very well, and high
earthen dams can be made of it without a masonry core,
provided the surface is protected by a thick ceat of yellow
soil. Black soil in drying up contracts and cracks, and the
dam is likely to be injured if the surface is not profected.
At present prigation is practised on a very small sale from
village tanks, and there is always a demond of water for hrigrated crops as the

tanks which foil exactly when they are most wanted, while assessment with water rate on such arms is very high, and it is no wonder that the people should be access to irrigation; but, when an unfailing sopply has been given, I think that people would take to growing irrigated er. pt. The district is flat and so far attempts have failed to obtain a tank which can have even five feet bend of water. The only course is to obtain water from the Nerbuda, and as long as people do not change the kind of crop the channel cannot work with profit, for in ordinary years no water would be exquired by the land-owners. It would, therefore, he necessary to start a small schenocand let the land-owners see that it would be profitable to take to irrigation, and then the large scheme now before the Commission may be taken up with advantage. The land-owners have to undergo a large initial espenditure in the form of making hunds all round and manure, and they cannot afford to do it cales they are critain of the unfailing nature of the supply. One-half of the number of cultivators and labourers of the district cannot get work for screen months in ordinary years, and the result was evident in tha last famure. It is then fare necessary to have irrigation in the district which would gire work throughout the year to a good portion of them. As the large schemo cannot succeed all at once, I propose to pump up about 100 enhic feet per second of water from the Nar-badda between Janoro and Nand. This will be taken to a large schemo cannot succeed all at once, I propose to pump up about 100 cubic feet per second of water from the Norshaddu between Janoro and Nand. This will be taken to a reservoir constructed so as to insure three days supply. Main channel will be taken out from the reservoir. This would irrugate about 20,000 acres of famil in years of average rainfall. It is true that the pumpling arrangement is always dear, but the loss in the purchut case would be very an all. Even if people do not toke water, pumps can be ntilized for other purposes, such as woter-supply for towns and if the schemo succeeds, the larger scheme can then be taken op.

No. 8.—No more drainage works are required in the Breach District. All those that were required have already been done. Water-logged areas have improved and commow grow cotton. On the other hand, the villagers in the burn lands of Vagra complain that channels have washed may the lands too mach and have importrished the foll. The Mamlatder of Vagra also informed me that wheat did not grow well in portions of burn lands algoring the channels where it formerly flout-lands also have layer of sweet soil having been partially washed away salt appears on the surface and this has spoiled the lands. He considered that it would be the best to let the channels gradually silt up to some extent. some extent.

- 1. Q. (The President.)-You are Assistant Engineer at I tou-hf-Yes.
- 2. Q. How long have you been there !- About three TEBRE.
- 3. Q. Where were you before that !- At Thoma.
- 4. Q. You have been at Eruseb throughout the whole of the famine?-Yes
- F. Q. Were you to charge of the famine works?-Yes.
- n Q. (Mr. Moir-Maelennie.) Are yen a Cujmati f --
- 7. Q. The (Precision) You say in your memorardum at present irrheation is practiced on a very small scale form village tasks, and there is always a demand for irrheater crops as the rairfall is incuficient." You had alleding to the interpretary of any power, when there has been no rain, or do not tream all years F-At present no lare only a few tanks, and it is to these tasks that I refer.
- 8. Q. Do you mean to say that there is a demand for water, whether there is good rainfall or not?—If there is no minfall, there will be no water in the tanks.
- P. Q. Is there obusys a demand for water when there is a good rainfall?—Yes, it er use the water even in good years.
- 10. Q. Po you consider rice a more profitable crop il an cotton f W) en they grow rice they generally grow two crops, and therefore the rice crop is most profitable.
  - 11. Q. What do you grow after rice ? Grain.
  - 12. Q. (Mr. Mair-Mackentic)-And val i-Yes.
- 19 Q. (The President.)—Have you had anothing to do with repairing village touchs in your district f-Yes. I have repaired a few.
- 14. Q. Are they in good order f-They are penerally a lted up to some extent.
- 15. Q. What dil you do to them as famine relief works i-Dog out the allt and coloneed them.

Mr. K. K. Desai.

- 16. Q. By moking new bunds ?-No, hy estra digging.
- 17. Q. Deepening ?-Yes.

9 Dec. 01.

- 18. Q. At present are there many tanks that you know of in good condition and repoir that will hold water, or are there only a few ?—Most of them are for domestic pur-
- 19. Q. I om tolking of irrigation tanks?—There are very few in good order; in fact there are very few tanks at all. There are bardly ten.
  - 20. Q. Hardly ten?-Yes.
- 21. Q. (Mr. Muir-Mackensie) Are there not some on the Aukleshwar side ? I am referring to the north of Broach.
- 22. Q. (The President.)—You do not think that you can find sites for more tunks?—We have been trying, but we heve not succeeded.
- 23. Q You say "One-half of the cultivators and labourors of the district cannot get work for seven months in ordinary years." That is very emprising. Do they live for trades months when the servings of fire results when the servings of fire results 2. Year for twelve months upon the earnings of five mouths ?-
  - 24. Q. They do not work ?-There is no work for them.
  - 25. Q. The country is cultivated ?- Yes.
  - 26. Q. And there is no work for them ?- No.
- 27. Q. You go on to say "It is therefore necessary to have irrigation in the district which would give work throughout the year to a good portion of them." Where is irrigation to come from !—I believe there is a project for bringing a canol from the Nerbudda which hos heen submitted by Mr. Beale.
- 28. Q. Is the country black cotton soil ?-Mostly black cotton soil.
- 29. Q. Yon say "These facta tend to show that black soil is unsuited for irrigation and that is the general opinion"?—We have small tanks where irrigation is practised; they actually grow rice. Although this is generally known as black cotton soil and unsuited for irrigation, this little fact shows that it is suitable for irrigation with good water. gation with good water.
- 30. Q. By building these tanks would there be an extension of rice cultivation?—Yes, and bagayat, froit trees and gorden produce.
- 31. Q. You say "A large scheme cannot succeed all at once. I propose to pump up water from the Nerbuddo." Have you worked out the expenses of that ?—I tried to get figures, but I could not get them.
- 32. Q What is the height of the lift from the Ner-buddn? -Ahout 60 feet. To start with, we shall have to begin on a smoller scale thon what I have proposed here.
- 33. Q. Can you lift about 100 enhit feet per second ?-If it succeeds we can increase the volume.
- 34. Q. You want a very powerful pump?-Yes, or a number of them.
- 35. Q. Havo you submitted this proposal to Government?—This is the first time I have mentioned it. I think pumping would be dearer than bringing the eansi up, but people would not take to irrigation all at once, and with pumping we could extend gradually.
- 36. Q. Have you ever visited the egricultural farm here ?-No.
- 37. Q. What is the feeling about water on black cotton soil. Does water do no good !— At first three inches of rain is required in black soil; after that the amount of woter. required would be about one inch.
- 38. Q. Have you got a programme of works for the next famine?—Yes, it is with the Executive Engineer.
- 39. Q. What do you think is the best work for famine lahour ? Digging.
- 40. Q. Whot sort of digging ?-Wo have tanks for Brosch, and we have olready got two reclamation projects. We have taken np these two projects, and if they succeed then more reclamation works will be undertoken.

- 41. Q. (Mr. Higham.)—How do you propose to get the supply of water ?—It is proposed to get it by a caual from the Nerbudda.
  - 42. Q. That is the only way ?-Yes.
- 43. Q. There is no other woy?—I propose to start in a temporary way by pumping up a small volume of water so that the people may learn to oppreciate it. Although there will be some loss to Government, yet on the wholo the project will be successful.
- 44 Q. You think it is possible that it may be connui-cally advantageous to convert ull cotton soil into wet cultivation?—Not all; about one-fifth of the whole area moy be irrigated.
- 45. Q. Cau you get water for it from the Nerondda ?—Yes; I wish to change the feeling of the people; at present there is a strong feeling that black soil is quantiable for irrigotion.
- 46. Q. Why do you wish to change the feeling?— Because there are small tanks where irrugation is practised successfully.
- 47. Q. Does not a tank put more water on the soil than rainfall?—Yes, they use tank water in oddition to rainmater.
- 48. Q. (The President.)—Hove you any cases ontside tank irrigation to show that it would be profitable to apply water to black cotton soil?—In Poons. I think, they have black soil like that of Broseb, and they use water there with udvantage.
- 49. Q. I suppose the difficulty in making u tank in Broach is due to the fact that there is no fall in the country?—Yes; it is all flat.
- 50. Q If there was some fall, it would pay to moke tanks?—Yes.
- 51. Q. And as you cannot meke tonks you propose to make causls P—Yes.
- 52. Q. Is there any other source hesides the Nerbudda for getting water?—There is no other source that I know of.
  - 53. Q. No springs ?-No.
- 54. Q. If you were to bring water from the Nerbudda into the Broach District, would it not have the effect of water-logging a great area f.—I here would be no water-logging, because it would only take place where there are hollows, but then we have draios, so that there can be no water-logging.
- 55. Q. If you brought more water by canal, would it not necessitate making more drains ?—No; at present they are considered too lorge.
- 56 Q. There are complaints that the drains take the water away too quickly !-- Yes.
- 57. Q. Do they dry up the land too quickly?—Water-logged areas hove certainly profited; it is the other lands which have suffered.
- 58. Q. The complaint is that the soil near the surface gets washed off ?—That is in regord to the lond lower down.
- 59. Q. Could not that he stopped by a bund?—Thot would be very costly; loud owners cannot ufford that.
- 60. Why would it be costly to make bunds?—If sluices were provided at each opening it would do. If there were bunds on both sides of the chaunels and if small gates were made at intervals I think that would do.
- 61. Q. Have you seen places where the soil is washed off ?-I have; my experience goes back three years.
- 62. Q. Have you inquired into complaints on the spot ?-I have been to Aladar, where one of the channels was opened out and the people there complained.
- 63. Q. What happened there?—On the surface there was no difference that I could see.
- 64. Q. Was the soil on the surface washed off?—The disappearance cannot be judged by the eye on the spot; it can only be orrived at from what the laud can grow after-

  - (2) Lift and supins and natural flow. Villagers whose lands are infigated engage two men who are paid in kind at the harresting of rice.
- 3. (a) Up to March.
  - (6; November.
  - (c) Nope.
- 25. (t) Rice seedlings will be too mature to be transplanted.
  - (2) Rice will fail.
- 20. From Rs. 25 to Rs. 30 per month. By the tenant.
- 33. Silt is formed about half a foot every year.
- 1. Q. (The President.)—You are a Patel and landowner  $f = Y_{\rm res}$ .
- 2. Q. (Mr. Rieten.)-Of what district ?- Surat district and tipad taluka.
- 3. Q. (The President.)-How much land do you own !-
  - 4. Q. Is it irrigated ?-Yes I have a well.
- 5. Q. How many wells ?-Onc.
- 6. Q. One well for 200 acres f-Yes.
- 7. Q. That is not much irrigation; how do you cultivate rice on your land !-I irrigate the land in which the well is situated. I do not brigate the rest of the land; it depends upon rainfall.
- S. Q. Did your elllage softer much in the famine ?-Yes.
- g. Q. What do you think is the first thing to do for your rillage to enable it in resist famine should it occur again?— Tunks should be extended as wells are not successful therr, when no dig a well deep brackish water comes op.
- 10. Q. Have you get tanks in your village ?-Yes.
- 11. Q. Hew many !- There are about 25 taoks in my village; they are all small tanks.
- 12. Q. (Mr. Rajaratua Mdlr.)—Are they all irrigation tanks:—No, only two me irrigation tanks. The others are Local I and tanks irrigating kiari lands.
  - 13. Q. (Mr. Mair-Markenzie.)-All of them 9-Yes.
- 13. Q. (The Prevident)—Why do you say they are not irrication turks?—Tanks which irrigate more than 20 a. 100 are say called irrigation tasks; those which irrigate less than 20 ares are not called irrigation tasks. They call that a task "irrigation tasks which are reputed by the Public Works Department.
- 16. Q. Are there tanks in good order i-They are not. 16. Q. What is the matter with them f-They do not hold water.
- 17. Q. Do you do anything to improve your task—dig it couldn't con hold more water?—We are not able to limp, we can tanks as we have no morey; we depend upon therefore at 10 do it.
- 15. Q. How much do these 25 tarks irrigate altogether? -Al out 200 acres of rice land.
- 19. It That is 200 ances of your own hald !-No, I am tolking of the whole village.
- 20.  $Q_s$  What is the arcs of the whole village F+About 1900 acres
- 11. Q. Of these 25) are irrigated ?-Yes.
- 22, Q. Populathish the tanks can be enlarged?—Yes; but their exercised?>
- 23 Q. Versay in the monormound me that said forms to the extent to fight at I disable terry year i-Yes.
- 21. Q. Who may res it ?-It is simply given work
- 25, Q. How long ago were tiere tonle charely when wis extisted out of them last !- Only two table were r purel, for Q. How long ago; low many pairs ago!--Ido
- extraction of the 17. Q. likithey lofter of tilt i—They were sifted up
- gleografics.

  2.4. O. 1889, West opplied to the part and unce dealers of the O. 1888 in Security we name that there.

## E.- Wells.

31. (1) 20 to 40 let.

(2) (a) No. By spring and percolation.

(b) Yes.

- (3) With trough from Rs. 700 to Bs. 1,000.
- (4) 100 rears and upwards if sweet. If bra-kish it lasts for 25 years.
- (3) Br kon.
- (6) 1 to 3 acres.
- (7) Depends so the nature of the crop, about 5 acres per annum.
- 37. Paid on actually irrigated areas.
- 38. (1) No.
  - (2) No.
- 39. No.
- 23. Q. Have you anything to say about the damage done by the drains already made f-Water has been taken out of some water-logged arens.
- 30. Q. Why do you want drains; is the land much water-legged? -A certain portion is leadly water-legged.
- 31. Q. Do you grow exten on your land?-No, all the land is water-logged and no rotton can be produced.
- 32. Q. (Mr. Hibetson) Is the whole village water-logged? About 1,000 acres ic.
  - 33. Q. (The President.) Inside the village ?- Yes.
  - 31. Q. No cotton can be grawn in that area ?- No.
- 35. Q. (Mr. Muir.Markenzie.)—How many acres are there in the whole village?—About 4,000 acres.
  - 36. Q. The culturable area is 2,050 ?-Yes.
- 37. Q. (The President.)—thave you heard convinints about the drains ?—I have never heard any complaints.
- SS. Q. We have been told that good soil is washed into the drains f-1 do not know; that is not my experience.
- SO. Q (Mr. Ibbetsen.)—How many of the 25 tanks were used during the famine year ?—They were not used at all, they were not drep and so were all elited up
- 49. Q. Did you dig kacheha wells in the beds of tanks?

  -Kacheha wells would not supply water to rice lands;
  the land is very andy.
- 41. Q. Would you like the Government to make more tanks there f.—If the Government made tooks on the water logged areas they would be of great use. If these water logged areas were conserted into tanks, they would be very useful.
- 42 Q. Are there any sites available untaide the water-logged areas !- Three are no other sites available.
- 43. Q. Have you paid any extra merement on account of your with F-No.
- 41 Q. Do you think it likely that you will have to pry any extra assessment on their occount?—No.
- 45. Q. Why do you not fear that there will be an extra assertment! Because it will not be increased for thirty years.
  - 45. Q. After that ?-It might le.
- 47. Q Do ran know whether you will have to pay an extra assessment after thirty years f—It depends upon the revision of extinuent; if Government raises it, then it will have to be pail.
- 49. Q. Are there many wells in your village i-No. It is very difficult to sink a well in nor village which is near the real the soil is undulating and sandy and wells are not practicable.
- 49. Q. (Mr. Rajeratan Millr.) You have nely one acli in the villege for irrigation f-Yer. It is impossible to sink nells as the lead is undulating and sundy.
- 59. Q. Po you think they would dig wills if they got talest on face make terms?—It is not possible to signed a seem if Generalization is alreaded the money.
- 51. Q. Out of 25 tacks, how many are there which indicately alon for smooth-There may be about for or how of these.
- R2. Q Wentlife raset le miling to take esse such tasis and loop them in requirit it conference is reduced by a redail ?—Pupple are ret in a position to do that.

Khadubhai.

Mar. 53. Q. Would it not be profitable for them to do it?—
Manibhai They are not able to spend any capital on land.

54. Q. (Mr. Muir-Mackeuzie.)—How much kiari land is there in your village?—More than 200 acres.

9 Dec. 01.

- 55. Q. There are 25 tanks for 200 never of kiaris?-You.
- 56. Q. Do van think that it would be a good thing to make tanks in the water-logged soil ?—Yes.
- 57. Q. Was any application made to Government about thir ?-No; but we have asked the local officers to make draios to remove the water.

58. Q. At what rate roold money be borrowed from the banias of your village ?- From 13 to 15 per cent.

50. Q. Can you yourself get money for less than that?
-Not less than 6 per crnt.

- 60. Q. There are no waste lands ?-Ail the waste lands are salt.
- 61. Q. If a tank is made in selt lands, would it be neefel? -No.
- 62. Q. What is the cost of a well P-The average cost of a well for one kos is not more than Rs. 1,009.

# WITNESS No. 20 .- MR. MANIBHAT KHANDURHAI, Patel, Amboli Taluka.

7/-Maniblai.

9 Dec. 01.

1 Q. (The President.) (Through an interpreter.)-You are a Patel ?-Yes, of Ambeti taluka io the Surat district.

- 2. Q. Are you a land-holder ?-Yes. 3. Q. How many acres do you own?-About 50 acres.
- 4. Q. Did you suffer much from famine in your village? -Only the juari diel; the other craps were successful.
- 5. Q. Was there any loss of life !- No.
- 6. Q How are the crops grown: have you any irrigation there !- We have wells in the village.
  - 7. Q. How many wells?-About 70.
- 8. Q. What is the area of your rillage?-About 1,800
- 9. Q. How much of the village is irrigated? About 109 nerre, bugazel.
- 10. Q. Then, you have 70 wells to 100 acres? Yes. Only goraf lands and jaray it lands are irrigated; dry-crup lands are not irrigated.
- 11. Q. During the famine year how much land was irrigated?—About 10) acres.
- 12. Q. You did not irrigate more? There was rice on the rice lands.
- 13. Q. How did that rice fare? -- It all dried up, Int some kieri lands were irrigated, and the rice crop on them was successful. They got about a 4-anna crop.
- 14. Q. (Mr. Ibbetson.)—They were Irrigated from wells:—Yes.
- 15. Q. (The President.)—All the rice failed?—Yes, but in some kiner lands will nater une capl and so some sice was raised-a 4.anna crop.
- 16. Q. Why did they not irrigate more?-The sugar-cane had to be considered. After a rice crop, sugar-cane cannot be raised for two years.
- 17. Q. (Mr. Rajaratna Mdlr.) Was no water available for fodder crips ! - All the sugar-cane is under wells, and the wells could not be utilized for that crop
- 18. Q. A well can only irrigate an acce and a half?- Yes, of sugar-cane, but three acres of dry crop land can be irrigaled.
- 19. Q. They did not irrigate other crops?—All the land was occupied by sugar-cane, and so there was no land for dry orops. The water was entirely utilized in irrigating sugnr-caue.
- 20. Q. If there was water enough in times of famine, would they not utilize the water to mise fodder crops in addition to sugar-caue?—They had rhough of fodder in the taluku, and so they did not raise it.
- 21. Q. (Mr. Rhelson.)—Do you think that fear of enhanced assessment prevented people from making more wells!— Yes.
- 22. Q. What makes you think so?-The cultivators are afraid of increased charges.
  - 23. Q. On account of the wells?-Yes.
- 21. Q. Have you many tanks in your village?-Four tanks, large and small.

- 25. Q. How much land is irrigated from them? Sout 60 neres
  - 26. Q. Are they in good repair P-No, they are not.
- 27. Q. If they were put into good repair, how much land would they irrigate? A bout 100 acres.
  - 29. Q. Double the persont area?-Yes.
- 29. Q. Would the people like to see them put into repair?-Yes.
- 30. Q. Supposing that, for the extra 100 per cent, the people had to pay the wrt accessment, would they still like to see them repaired?—Yes, if water was available, the people would pay for it.
- 3). Q. You say that the people would object to the plan by which Government should make wells, and thou charge wet assessment on the land; why should they object?—The people are already assessed a sub-soil rate, and if they are charged an additional rate of Rs. 12 per kes it would be enry hard on them.
- 32. Q. Do you think Government can make wells as chought as the people themselves?—If wells are wanted, the people can make them themselves; they did it in famine times.
- 33. Q. [Mr. Rajavatna Maltr.)—The .70 wells you referred to, are they brightion wells?—Yes, there is also an irrigation tank, but this year there is no water in it.
- 3t. Q. Arn many of them old wells !-About 30 or 40 are new wells.
- 35. Q. When were these 40 old wells constructed !- Befare the original Surrey -about 50 or 60 years ago.
- 36. Q. What was the recomment at the original survey on these wells !-- An average of Rs. 5 per acre, Lugayet.
- 37. Q. What was the organisment under the revision of certalement?—Re. 15 and Rs. 5 per acre on kharif lands.
- 38. Q. From an average of R. 5 to unaverage of Rs. 15?—At present the inter are Rs. 15 to Rs. 16 per acre under tanks, and for land under wells Rs. 4 to Rs. 6 per acre.
- 39. Q. I am not referring to tanks?—Wells are Rs. 4 to Rs. 5. At the time of the original survey, the assessment was Rs. 5 to Rs. 6 per agre, and at the revision survey, they were from its. 4 to Rs. 5.
- 40. Q. So there has been a reduction !—The total assessment on the whole village remains the same as at the original surrey; there was some reduction in some fields and increase in others.
- 41. Q. (Mr. Muir-Mackenzie.)-Were any new wells made in the familie year of 1899!-Four new wells were constructed.
- 12. Q. Are they all being used now?-Yes, they are all being used.
- 43. Q. Where did the money come from?-The people spent it out of their own pockets.
- 44. Q. How much did they cost them?-Total cost of coch was from Rs. 200 to Rs. 300.
  - 45. Q. Were they pakka or kachcha?-Pakka.
  - 46. Q. Of how many kos ?-Of one kos coch.

WITHER No. 80 .- Mr. Sulbmanii Carrunii, Patel of Kuranjia, Mandvi Taluka.

Answers to printed questions.

  - (2) by cutting canals and by suplas.
  - (0) (a) April, May.
  - (2) November end.
  - (c) Kere.
- 26. Yes, to save the crep when water fails.
- 30 For tanks irrigating more than 20 acres Government contribute 10 per cent, while the cillagers pay 10 per cent. Very few tanks are repaired in this manner.

### E.-Walle.

- \$1. (1) 45 to 60 feet.
- (2) By spring as dipercolation. All wells which have dried up were supplied by percolation.

No, but owing to successive erasous of short rainfall they liero lecome salue nor.

- 13) Ra. 700 to Re 800.
- (4) About 100 year-.
- (5) By los.
- 1. Q. (The President.)-(Through an interpreter).-You are a Patel i-Xev.
  - 2 O. And also a land owner !- Yes
- 3. Q. How much land do you own?-Lighty acres in British territory.
- 4. Q. Hare you any irrigation works in your village? New wells were sunk during the famine year from talasi adrinces.
- 5. Q. What is the area of your village?-About 2,100 actes.
- C. Q. How many new well- were made !- Six.
- 7. Q. Were there may wells before that ?- They were drinking wells, not irrigation wells; the latter are also useful for druding purposes.
- S. Q. Have you any tanke! Yes, six, of which three are intigation tauks.
- 9. Q. What area of crop is raised under these !- About 70 miren of rice.
- 10 Q. In a village of 2.100 acres, that gives a very small area of irrigation i Only some rice lands are irrigated; nothing clos.
- 11. Q. Do you think the village would be lest improved by a sking note wells or more tanks?—More tanks; wells are not precisable in the village.
- 12. Q. Why me they not practicable? Water does not extrerelly enough from the springs.
- 18. Q. Are the wills very deep?-You cannot go doen deeper than thirty or forty lats.
- 11 Q. Alle. Muir-Markenrie) In there work ?- No me more a troy leading guies sand.
- 18. Q. (Me. Rieton)—Leis elepta had?—Ver; ne vivit poderp becrees el tie quiek ered.
- 16 Q. Did your villege suffer very much during the last four rel-Yes, very much
- 17 Q. Ponculation of any sites enitable for making the totals in the village?—Yis; there are sites available 11, 17 . 4: 14.0.
- In Q. Would you like to see the system of tanks .;--Yo.
- 12. (1. If you reply to the written quarti me sen any statist perplose greented from dipping we'ledy the lear of children's testion out; why did you say that?—I do not say so

  (7) One to S acres per annum.

Mr S. Carreer. p Dec. 01.

- 39 No. Where the stone blashing when childs is found, it is necessary to build.
  - 29. No.
- 40. No. It will go a great may to assist the cultivators to construct Locksha wells.

# Remarks.

- 1. The claracter of the onl is girst, Iles, and leave. There is no demand for water. The crop which tequires irrication is rice. It requires watering three or four times during the season about the middle of July, and thereafter if there be no rain up to O-tober.
- 2. Plack soil also requires water in kisri londs grown with rice. Small tanks constructed in such a ill hold water. If the tank is dug till the goranni soil is found. Say if the 6 free are dug. High catthen dams can be made of it without mesoury core walls. During average rainfall black soil will require water. There has been a desire for irrigation works on the part of owners of block soil and the construction of tanks is remarkative.
- S. Nameney should be spent from the District Bard's funds on tarel inightion. It is not the practice for Government to vicourage the covernation of arch works by leans to District Bards. Local responsibilities should not be enforced in this connection. Such works are of given value as concerning village water-supplies for men and cattle. calilo.
- 4. The construction of new wells be encouraged. No experiments have been tried to deepen wells as none can
  - Artesian wells should be encouraged.
- 21. Q. Why do ron think that the well linds will not be necessed? No wells are practicable and there is no large yet, therefore, there should be no assessment.
  - 22. Q. You have made six new wells? Yes.
- 23. Q. How do you know that there will be no enlarge-ment of assessment f-Government may increase the assessment ment on new nella.
- 24. Q. As a matter of fact have Government made any promise unt to do so! I am not aware of any promise
- - 26. Q. The others?-They have to be rejaired.
- 27. Q. When were these two tanks replired? In 1890, during the famine,
- 28. Q. If the other tanks are repaired, would the cultivators trigate more land?—If they are all repaired, more fand would le irrigated. It would be advantageous.
- 29. Q. Would the people be ready to pay extra assessment on that land?—Yes, they would be willing to do en.
- 20. Q. You say that you do not appeare of Government making wells in private lands and charging on the land; why do you say that?—If Government make these wells and ige on the fard, then the neighbours will take advantage of the wells without being el arged any rate.
- 31. Q. Supp sing, instead of advancing takavi, Governthe cultivators charged wet assessment, would they like that are in cement, or would they prefer to take takari?— They would prefer to sink a well at their own cest.
- 12 Q. (Mr. Muir-Mood entir)—Why nould they profes that F-They would not fille to incur node'it; said so would rather do it it their own cost.
- Sr. Q. They vouil ret take talarl under they expeli-
- it Q. Supposing Government polities the wills at it of angel accessors, there would be no delt?—They would be at, if Government did not let other money look.
- 13. Q. Surpour a Controvent to have named back as it of the lastices with They would like that.
- 17 Q. fick miel arrest enthantlyen behaltig to 12 f-Set i contact to upoel .
- If Q How many cores well & A'r infigure f-

WITNESS No. 31-MR. SAYAD GULAM HUSEIN GULAM MODIUDIN.

## Answers to printed questions.

Dec. 01.

- 1. The area of Ankleshwar Tuluka is 85,747 acres and 32 gunthus.
  - 2. The onliurable lund is 76.952 acres and 8 gunthas.
- 3. In the following years land below mentioned was irriented:

Yenr.	Aere.	Gnnth	15.
1898-99	. 67		Tank water.
11	. 302	212	Well water.
1809-1900	. 696	32	1)
1900-1901	. 1	11	Tank water.
	. 154	29	Woll water.

- 4. There are three kinds of land in Anbleshwar Taluka;
  - 1. Black soil.
  - 2. Yellow soil.
  - 3. Black and yellow mixed called Besar (Gabhania).
- 5. Gain from cultivation much depends on irrigation. When the rain is cauty the cultivation entirely depends on irrigation. If the min is sufficient throughout the four months then only the onlineable lands do not require addi.

- tional water. Rice, sugarcane, wheat, tobacco, vegetables, etc., require much water.
- In Gujarat there being no irrigation work people entirely depend on rala water.
- 6. In this part sufficient outturn from cultivation can be obtained if the rainfall is 30 to 40 inches.
- 7. If 4 or 5 inches of rain falls in the beginning of October or before the end of September there would remain no need for min for the rabi crop.
- 8. If the rain is senuty wheat and Juari crops require to be watered. Sugarcano and other Bugayet orops always require water.
- 9-10. This answer requires to be dealt with at great length, but in short 1 state my opinion that every vegetable and Ragayet orop requires water 20 to 25 times, and that is to be given at least at the interval of eight days.
- 11. The water rate is merged into the assessment, and therefore no separato figures are given. tienerally water ante is olurged at Rs. 6 per Bhingha. This rate is recovered whether there be no crops mised in the field.
- I shall state other information besides what is given above orally before the Coronission.
- Q. (The President through an You belong to Ank'o war in the Broach dietrict?-Yes.
  - 2. You are a land- weer there?-I am an Inamiar.
- 3. Q. How much lead do you own?—I own 3,500 singhas including alienated and Government land.
- 4. Q Has the village been surveyed?-No.
- 5. Q. Has the village been irregated at all? In one village, Amolee, there are two or three wells which irrigate.
  - 6. Q. Is that ull? Yes.
  - 7. Q. Are there may tanks ?- No.
- S. Q. Did your district suffer very much during the last famine? -- Yes, it suffered a great deal, and large numbers of cattle died.
- 9. Q. Can you suggest anything practical to gnard against the effects of another famine? —I would suggest the construction of more cruals and tanks. The people would take advantage of them.
- 10. Q. Cannot wells be made?—Wells are not profitable; to irrigate an area with well water costs a good deal.

  11. Q. How much does it costs. To irrigate one ringha
- of land it costs Rs. 1.8 per diy.
- 12. Q. How much does a well cost F-A small well, Re. 500, and a large one, Rs. 700.
- 13. Q. Government will give you help for that. Would you take takavi? Yes, but I cannot get it. 14. Q. Why not. Did you ask for it?-I askel, but I
- did not get it.
- 15. Q. Why did you not get it?-Government did not choose to give it.
- 16. Q. Do you prefer canals or tanks !- I prefer canals to tanks.
- Where would you get canals from ? From the 17. Q. Where We Nerbudda and Tapti.
- 18. Q. What is the soil like? -- Gorat and black sul, but mostly gorat. I refer to the whole taluka, and not to my own village. Canals would be heneficial to the whole taluka.
- 19. Q. Are there any places in your teluka where you can make tanks?—Yes, sitos are available.
- 20. Q. Was any tank work done by famioe labour during the last famine?-Not in my village: in the Ankleshwar taluka two tanks were repaired, but they have not proved useful.
- 21. Q. Why not dlg wells in yoor own village?-It depends upon the wish of Government.
- 22. Q. Would you make a well if you get a takivi advance?-With great willingness.
- 28. Q. Would you make more than one well ?-I do not favour wells; I prefer tanks.
- 24. Q. Could you get money from the concar?-There nro no sowcare, and no sowcar would lend money in a famine year.
- 25. Q. (Mr. Ribelson.)—What rate of interest would they charge?—From 9 to 12 per cent.

- 26. Q. You say you do not approve of wells, but that you would like to have tacks: why is that f.—The people have to work on wells the whole day, and their whole time is occupied in irrigating half an acre.
- 27. Q. Can you grow rice in your village?-There are no rice lands.
- 29. Q. What would you irrigate from tanks?-Sugarcane, wheat, and indigo.
- 29. Q. (Mr. Rajaratna Mdlr.)—Are there good sites for tank- in your Inam village?—There are.
- 30. Q. Have you any idea of the probable cost of such a tank?—A go id tank would cost Rs. 10,000 to Rs. 15,000.
- 31. Q. Would you be prepared to make such a tank yourself if Government gave you takavif-I would accept the money, if Government would take it back in a large number of instalments.
- 32. Q. How many instalments ?-1 am not prepared to 837.
- 33. Q. (Mr. Muir-Mackenzie.)-Do you advance money to any of your tenants ?-No.
- 31. Q. Have you any water-logged Inoda in your village?-No.
- 35. Q. Have you seen any of these drains f—I have seen in Piludra and other villages.
- 36. Q. Dul that do good or harm?-It has been advantageous to the neighbouring villages.
- 37. Q. If it is extended further on, would it be advantageons to other people also?-Yes.
- SS. Q. Have you heard that the surface soil is washed away?—Yes. If water goes slowly, then the surface soil is not washed away. If it goes rapidly, then the surface soil is washed away.
- 39. Q. (Mr. Ibbetson.)-Which water-the water in the drain, or water running on the surface?-The rain water falling on the sarface.
- 10. Q. (Mr. Muir-Mackenzie.)-Where is your village, near the drain?-About a kes from the drain.
  - 41. Q. Do any tenants get bagayet lands?-Yes.
  - 42. Q. The village is not surveyed ?-No.
- 43 Q. What rout do you take from the villagers !- I charge from Rs. 4 to Rs. 6 per sere.
- 44. Q. How much do you chargo for dry crop land?—The same charge: I do not make any distinction.
- 45. Q. Do you take rent by instalments ?-No. Government charges water assessment on the land, whether it is irrigated or not, but it should charge assessment only on the actually irrigated area. There are many creeks in Ankleshwar tuluko and if dams were built we could use the water. In the ralny season these tracts are full of water, but the water flows uselessly away. If this flow could but the water flows uselessly away. If this flow could be checked and the water impounded, the cultivators wouldbe benefited thereby .
  - 46. Q. Is the water not salt ?-No.

## NINETEENTH DAY.

## Surat, 10th December 1901.

WITNESS No. 32.—Mr. J. MOLLISON, M.R.A.C., Inspector-General of Agricolture in India.

Letter from Witness to the Chief Secretary to Government, Revenue Department, Bombin, No. 21, J. M. Hove dated the 16th November 1901.

la Dec 01.

- In reference to your No. 2282, dated the 26th October 1901, Famine Department, I have the honour to offer the following remarks on extension of Irrigation throughout the Bombay Presidency.
- 2. During 11 years work in the Presidency I have gained a fairly accounte knowledge of the agricultural conditions existing in each collectorate.
- Similars existing in evan collectorate.

  3. In the fellowing. Note I refer separately to agricultural conditions and facilities for successful irrigation as they exist in (A) Gujarat, (B) the Peccan and Seuthern Makratha Country. I do not think it is necessary to include in the enquity the Konkan, Kanara or the southern talukas of the Surat District. In these trues the rainfall is geography so heavy and assured that fice is the staple crop. There has in these parts occasionally been pattial crop failure from scant rainfall, but there is much more pressure used of extended irrigation in other names of the pressing need of extended irrigation in other parts of the Presidency.
- 4. In Gujarat the soils vary considerably in character. Some of the soils can be successfully irrigated, others cannot.
- of.

  6. In considerable portions of Ahmadabid, the Punch Mahale, Kaira and is adjoining Barola territory the soil is used militaria. It varies in character from a light sandy learn to a stiff losio. These alluvial soils extend to a depth of 40 feet or more often without any change in character or consistence. The older existing wells usually hold an mafalling supply of water. The water in some wells as ever, in other brackish. Wells with sweet and brackish vater are commonly found very close together. The water from brackish nells is specially solitable for tobicco, but it may not be so salt as to be unsuabble for other crops. The initial cost in determining whether a well is likely to yield sweet or brorkels nater is small.
- The initial cost in determining whether a well is likely to yield sweet or brorkish wher is small.

  G. In these alluvial plains there is considerable scope for extension of successful irrigation from wells. Such extension would require not only large mitial outlar, but large recurrent expenditure, because the wells would be costly in construction and the parametr water forch being but the cost of taising water would be high. It is certain, however, that the average cultivator in these parts before the last families was telerably will circumstanced. The Coarotar villages of Kaira and of Rareda territors are pushely as fertile as any in India and the average knubic cultivator in them has or can provide sufficient labour and manner to do full justice to any extended scheme of well irregation. In the families year (1829-1820) the cultivators of these Charotar villages, as also generally it roughout the alluved plains of Northern (Injurat, helped by small talanci advances from theorement as themselves to dig Lichter wells in large numbers. The cost of digging through the soft selluvial and new triffing. A talanci advance of Rs. 25 or Rs. 50 was smithein for digging a well and for the leather Lag, repeated other fittings. The perpendic far sides of their Lichtin wells were very solid, and it was exceptional to ind a Lichteda well tailing in during the fairs as on. These wells were consulted after the following measure. The surface of a measure in good wells in that times.

  The many of them gave a full supply of water throughout the son, the surface of water in good wells in the times.
- 7. It is n typerit letodig lactel swills to encountilly in black and or entrailed a district, became the wells, after ner for a el art period, have a terderry to fall In-
- S. In the alluvial tract of Northern Gujarat, there are a good a key losed sing estactors which are suitable for rive. The product is to proved by artificial bands result to ri-leds, but the resultable arms by finest counter research withbods, but if existallise timely insuff secultive rays and water out antile is incare of circulation for two or three waters of trouble the sold of the event through you arises. Each initial how when of the two exists from wells, also from tacks. Greater you come may tank our wells, also from justice only in the sold receive the arms, as if i he started only in the sold of Taluka of the Raise District and in the most of allows of Africa labels.

- 9. In the wheal and cotton growing parts of Ahandabal, also in parts of the Panch Mahdis and Kaim, the still le block or mixed black. It varies considerably in depth and character. The substata also vary. Below the black soil may be found light-coloured orgillaceous layers more or less concreted with lime and consequently more or less impersions to water. There combinations of soil and substillation in the control of the c impervious to water. There combinations of soil and sub-soil when impervious are not well saited for succeedal bri-gation of the onlinear crops. In the black soil parts of Ahmadahul the rainfall is usually light. There are, how-ever, a good namy situations where rice beds a saisted by tank irrigation have been successfully formed and there is probably considerable scape for extension and for further protection either by small tanks or wells.
- 10 In the Kaira and Ahinudabal Districts there are certain salt lands existing in some places in patches, in other places in more extended areas. Wells constructed in such areas have usually brackish or salt water oscless for irrigation. After a year of drought in these salt land areas well water, which is usually elightly brackish, may become intensaly so.
- 11. Palla-built wells of ordinary depth and especits 11. Palla-built wells of collinary depth and capacity generally throughout Northern Gujarat cast Rs. 1,00 to Rs. 1,500 each and large wells capable of working foar lifts (los) much more. The deep alluvinus of Kaira and Ahmadabal, particularly it soudy in character, needs water very frequently and a single los will not Irrigate more than two arres. Gujarat wells are, however, usually capable of keeping two or more los at regolar work.
- 12. In the famine year (1899-1900), although the 12. In the famine year (1849-1900), although the general area under trigation in the Presidence declared, the well-trigated area increased by about 100,000 acres. More than three-fourths of this increase occurred in Kaira and Almadaind, although the water of many of the aid wells in the black soil parts and in selt hand rillings became too salt for irrigating crops. The rice occas were bagedy answar and the tanks throughout these districts dried up. I can from personal knowledge say that the fielder produced from well-irrigated crops throughout Northern Gujant in 1899-1990 was the means of keeping alive many of the cattle which arrigated crops throughout Actuarn tinjaint in 1832-1870 was the means of keeping alive many of the earlie which survived the feature. The value of cultivation of this hand in producing feed for men and heast, in providing useful home labour and in keeping people off relief works cannot be lightly discounted. I believe that a ratio well could, with indivadage, be constructed in every parties occupied by a karledy well in the late famino and in thousands of other furoncale positions throughout the alimital tracts of North-irn (injurat. Such wells would be ancommonly useful in an ordinary serion and in a year of drought or famine would provide water sufficient for very extensive irregation.
- would provide water sufficient for very extensive irregation.

  13. In the funine year it was possible to irrigate from a two-loc well three crops on three different areas covering nitogetter 10 or 12 sensed ground. The three encessive crops in Northern Gunarit were ordinarily Sundhia, jouar sown in September, what sown in Novemter-December and Sindhia or Chion (Panicum militorium) sown in Marcharit. The grain of Sundhia foot trivial value, but the folder is very time and mutations on a fair average crop produces about 6,000 lbs. of dry hedder per sere. A good cup of integral wheat in Uniquest full lauver 2,000 lbs of grain and 2,500 to 5,000 lbs of stay per sere, but ewing to rest wheat is a riely copy in tinjars. The lost weather cap of Statilia does not on an average yield so heavily as the estiler cup. Terre was no dearth of manner in the famine year because it was not required for dry-crop collivation. The whole supply of the year was available for well-capting the development in the famine year beauty to see the copy in the allocal left trends of the produced were correcus.
- 14 Ter regiont brossi, excepting the allusial left about the Topiand the sandal left along the count, the soil is deep black cotton seit. On such land rute he le have been are confelly four allunder village table and more could be ferroot. The solid entirely invultable for the eclibration of cities ereja under well are ratherists a tension that exists of deepard retentite of a distance and the solid sta are fracts val

- 15. The soils in the northern cotton-growing talukas of as Surat Collectorate ore more variable. There are the J. Mollison, the Surat Collectorate ore more variable. There are the rich alluvioi bhata soils which fringe the Tapti and extensively grow valuable garden crops under irrigation from shallow wells. Thronghout the district there are n number of gorden villages with considerable areas of alluvial soil somewhat similar to bhata. These grow a great variety of valuable garden crops under well irrigation. Generally, however, the soil in the northern tallukas of Suret is deep ond black and chiefly grows dry crops of cotton and jawar. In plats the soil is more mixed in character and in such places well irrigation is extending. Inclor in particular to olay loum (kali beser) soils adjacent to the alluvini lands of gardon villages. Such mixed black land has extensively been brought under well irrigation since Revisian Survey. The reasons are that the land is suitable for irrigation, the This reasons not that the man is surraine for irrigation, and occupants are men of means and non onjoy assurance of tennie at a fixed rent for a definite term of years. On this class of land there is scope for extension of irrigation—perhaps also in the Surat District on mixed black sail of heavier character, but there are cert in risks in constructing wells on such heavier land which ought to be referred to. wells on such heavier land which eight to be referred to. It is uncortain whether o well, when constructed, will yield sweet or bruckish water. Water which is sweet early in the season may turn brackish during the hot weather. Brackish water for irrigation deteriorates temporarily or permittently mixed black soil and on any soil is only suitable for certain crops. In the black soils of the northern talukas of Surat, as in Broach, more tanks for rice irrigation could with advantage has constructed. with udvantage be constructed.
  - 16. In paragraph 4 of the memorandum of points to be considered by the Irrigation Commission there is a question of nthizing the waters of the Nerbuddo, Tapti and Sibarmati. The waters of the two former tivers could only in Gujarat be diverted to irrigate black soil areas which are to were large extent quite unsuitable for irrigation. The waters of the Saharmati or my other Stream which fluor through the alluvial plains of northern Gajarnt would lee extremely useful for irrigation, provided the lands irrigable consists of light or comparatively light ulluvial sail, but if this proposed system of urrigation is carried through the low-lying black soil rabs areas of the western tallicas of hundright, it is almost certain that the results would Ahundabad, it is almost certain that the results would be unsatisfactory.
  - 17. The information given in the foregoing paragraphs in reference to the various districts of Gujarat undicate that considerable extension of irrigation is printicable. There are, however, risks which must be kept well in view.
  - 18. In parts of the Decean and of the open plains of the 18. In parts of the Decean and of the open plains of the Sathern Mahratha Country the water in the wells got so low in 1899-1900 that irrigation was intermittent. This was not the result of one sason of drought, but of several seasons of scant rainfoil. The famine year 1896-97 caused extremo drought over the greater part of the Decean, and the more open plains of the Karnanak, still in these parts, in that year the wells held sufficient water for year extensions. in that year, the wells held sufficient water for very extensive irrigation. There was then considerable arrivity in constructing new wells and in deepening old wells to increase the water-supply. Lorge portions of the Decean and the Karnatak are extremely liable to season, of drought, the Karnatak are extremely liable to scasons of drought, but it is difficult to believe that those parts will again have a succession of seasons so disastrons as those which began with the famine of 1899-97 and culminated with that of 1899-1900. During that period in places the water in the wells got so low that even drinking water became scarce. Still statistical figures show that excepting Poma and Sholanur there was in 1899-19 on considerable increase of irrigation under wells in all districts of the Decement Karnatak as compared with the year before. In these districts the tion under wells in all districts of the Decemental Armatak as compared with the yeor before. In these districts the protection afforded by wells ngainst drought is in my opinion much more satisfactory than that afforded by tanks or larger irrigation works. After years of scant minfall the tank and canal supplies fail just when the water is most required and it can be put in evidence that some at least of these larger irrigation works are not an unmixed blessing in other respects. I can call to mind agreen languistics which these larger irrigation works are not an unmixed blessing in other respects. I can call to mind several enquiries which the Bomhay Agriculturol Department was asked to institute in recent years regarding damage done to land by tank unil cansl water in causing water-logging, soft officerscence, etc. Considerable damage has been caused by Reh under the Nira Canal. The Manjri and Mandwa sugarcane area has been flooded to excess by the Klaurakwasia Canal for a number of years. A good deal of land which was formerly cultivoted has by excessive water-logging been converted into swamp and owing to unhealthy conditions produced by wetness of soil. The crops of cane now grown are not nearly so good on an average as they were 5 to 10 years

- ago. I can, if questioned by the Commission, give detailed reasons for these failures and for other failures of irrigation works throughout the Deccan ond Kainatak.
- 19. There are various reasons why irrigation from wells cannot be indiscriminately extended. The cost of roising water from n depth of 25' or 30' as in the Decean is heavy and is particularly so from the deep wells of Gajanat which range in depth from 40 to 60 foot. This cost is so great that only a good well-irrigated crap can pay. A good crop ander ordinary circumstances can only be produced if henvily manual, earefully cultivated and regularly watered. This necessarily restricts the area which can be successfully irrigated from wells to sooh situations as have at reasonable doubt lolerably certain supplies of sub-soil water in irrigated from wells to sooh situations as have at reasonnble depth lolerably certain supplies of sub-soil water in
  ordinary sensors. It also restricts the cultivation of well
  irrigated crops to cultivators in easy circumstances, to men
  who have the means or the orelit to provide sufficient
  mannal labour, sufficient mannes and sufficient work cattle.
  Perhaps it would be possible for a few years to grow on the
  very rich ulluvial soils of Gujarat successive numanured
  oraps which would pay, but such practice would cause soil
  exhausthe in a very short period in ordinary Indian soils.
  Valuable craps grown under wells tonst necessarily be
  watched by the owners. Therefore it is not likely that such
  cultivation will extend far from the village sites. cultivation will extend far from the village sites.
- 20. Irrigation from a tank or canal is cheaper than from a well, but with any system of irrigation heavy applications of manne and specially careful cultivation are necessarily required to give profitable results in average scasums. In years of absolute drought waterings as required would, however, without manner or special tiliage be extremely beneficial on such land as is suitable for irrigation.
- 21. I have stated certain circumstances which will restrict the successful extension of any system of irrigation in the presidency. In my opinion the chief restriction to this or any other agricultural improvement will be found in the large and general indobtedness of the agricultural classes to large and general indobtedness of the agricultural classes to the Banias. I see no hope of special agricultural advance-nent in the Bombay Presidency until this incubus of debt is removed. It practically purplyses every offort towards improvement. I would be prepared to recommend that forernment should once for all liquidate the debt in some fuir and reasonable way and make it impossible afterwards for the cuitivator to borrow on the security of his land. Then it would be impossible for him to waste his substance in reclass caste erromanies to the extent that he does now in uscless caste ceremonics to the extent that he does now. There is no doubt that the general outline of crops in the Bombay Presidency is in ordinary years very seriously affected by the indebtedness of the cultivators because they are not in a position to cultivate to the best advantage.
- 22. Throughout the Presidency generally the oldest well may generally be said to occupy the best positions. This indicates on behalf of the people an intimate knowledge of the most favourable conditions for successful well irrigation. In the ording uplands of the Decean and Southern Mahantha Conners (oxeluding the red laterite sails in the Mahrntha Country (oxcluding the Deccan and Southern Wahrntha Country (oxcluding the red laterite soils in the west of Belgaum and Dharnar), it may be definitely said that the most favourable positions for wells ore the bottom lands consisting of mixed black soil 18" to 4' deep overlying murum with nuchanged trap still lower down. These substrates are pervious to water and scenare natoral drainage—very important considerations when land is continuously irrigated. There are throughout the Deccan and Southern Mahrstan Country were appearant stinations where wells can Mahmha Country very numerous situations where wells em still with greet advantage bs constructed. Fringing the most important rivers of the Deceau and Southern Mahratha Country, such as the Tapti in Khandesh, the Godaveri in Ahmellangar, the Krishan in the Southern Mahratha Country the soil is deep black. It gets sedden and wet in the mea-soon. It is extremely retentive of moisture. It is not pervious and therefore like the deep black soil of Brucch is unsuitable for growing irrigated crops. Such lands are specially suitable for dry rabi crops.
- 23. The best wells in the Decenn and Southern Mahrstha Country keep two or more motes (leather bag lifts) netively at work in ordinary years. A single mote will from a good well of moderate depth irrigate 3\(\frac{1}{2}\) to 4 ocres of such crops as require light irrigation, e.g., wheat, onious, and 2 or 2\(\frac{1}{2}\) acres of such crops as require much water, c.g.; sugarcane.
- 24. In the 1899-1900 famine year the area under well irrigation in the Presidency was considerably extended through takavi advances for constructions of kachcha wells and for deopening and requiring old wells. These advances were not so serviceable in the Deceau and Southern Mahratha Country as in Gajorat. Special officers were employed to deal with applications for takavi, but could not complete all

sopphies in the Persan and Southern Malatatha Country someoneith to make the aleaner service tide. It takes so continue to so ke well through find trap in the Persan. In a familie year the natural to be not if an usual and so the coston a lean on gots lower that the day. Rath irrigated copie can only be sown recombly during a cottain persol. It is therefore practically necless in a familie from the takes if a neils execut for despiting after Surember-Desember Desember. Dewniler.

- 25. It may be inferred from the last paragraph that I advocate the area of liberal fadacia iranees in ordinary years attent than in famine years for well construction. Unlimitary enquiry which must take time is necessary before traces no be given safely for wells. This enquiry can only properly to make by experienced practical mee. A man with sufficient knowledge of all the circumstances connected with successful extendion of well-irrigation would have so difficulty in disposing of numerous applications in a short time. He could take district by district, and to begin with streetion absances only to tol tabiy well-2-do califoraters and by preference refer the more lastourable positions, and experienced practical man with an indimate anowledge of native character if put on special duly would in a single season be able to dispose of mony applications if he took up district by district in a systematic way and thoroughly exploited each. He would be handerigated in his work in an intellerable way it loans when contented are not promptly poid in full. Such loans would be more freely taken by the propelie the present 0 per cent, rate of internat was lower. In the currently indicate that the latiture system is unpopular become controlled to a one extent by subcredinate decrement utilicials who for personal gain make a substantial deduction from evolution.
- 26. Complaints see wale that successful applicants for 23, comparing are unit tunimized in the manner con-templated by Government. If it can be proved beyond question that loans given for nell constructionare generally misupplied, then I think Government should undertake the minipplied, then I think to remains should undertake the construction of wells in the same way as any other irrigation work. A cultivator can construct a well cheaper and probably as well as by dovernment agency, and it is probably irreferable that he should have off undertake the work, but it may be found necessary to employ Government agency. In that case I urgo that the occupant of the land should have the option to exit all material and with its family do all diaging and rough work requiring ordinary labour. The value of such work as ordinary hirug more to defend from the total quilay, the difference should be labore. The value of such work at ordinary airing in et to be deducted from the total outlay, the difference should be a burden on the land recoverable like assessment principal and interest to be repayable in easy instalments spical over a long term of years. Government should bear all loss if the well fails to provide a full supply of good water at a real nable dipth in a year of average sainfall.
- 27. Under existing conditions the administration of the 27. Under cristing conditions the administration of the statured speces, the agricultural development of the Hambay freeidency, and the general efficiency of the Revenue Service are greatly landered, because the men employed in the Subordinate Revenue Service are not properly trained to their nort. This will some in part be tennedied. As bearing on carting inclining a part the following note before the Farmer Commission, which I do not wish to modify in

any de rice -

"28. I feel strongly that the Bombar Sub rdinate Biretime Street would be considerably streage that differential more extensively by national traffic trained men. The rules recolating the work of Circle Inspectors, District Inspectors as all Supering adents of Lend Records and Agriculture electric contemplate that such officers abouth investigation and active work, it is clearly full down that Once Inspectors will watch the easy in their enclosued decide activity automatic and active most trap fail we are lamped on a westly national for an entire and full and their proof that the rules and decide an easily not the respector with and englished and expense to english and expense of an englished activities and expense of the street of polished and englished and their content in some I are an electric englished the elements of area and activities of expenses of a reasonable suffered englished and englished and englished englished englished and englished englished englished englished englished and englished en ASSESSOR Y

- The District important and Superinterlents of Mr.

  Leaf Recapts and Agriculture exercisms superior J. Methods, shock in the work of Circo Inspection, bitalistical and other rounds are passed for the visible Inspection, it is at frough Philadel Inspection, Mandadam, Andatart Collectors and Collectors to the Inspection of Iraal Recaptand Agriculture, for consolitation. Compîtalian,
- compilation.

  30 It is, I this k, evitain that approximate a currary in agricultural ordinational values refuse returns can only be as used if any relief to agriculturally trained men. At present its Circle Irapeters in the Bouteur Prailience, who do the post reliside work, are, I helief, and Error men, who, owing to the winding up of the anyon, have been compulsorite retural. Itsen that department. They were truncal in that department to active outdoor work and to approve in a plactical way agricultural facts and operations, and as Circle Inspectors, such training that learn found valuable.
- found saluable.

  "31. It is unlikely that agreed meally trained mea will needly Circle Imperiors posts of Re 25 perus as muches they can be coloured pronocion and good with reas in time to be Manuadata. I do not suggest the needs ty of special promotion for any agreed trained meal. At the salue time there can be little doubt that such mean as show special appliede and reliablences at work would have more or less of a tion on such posts as District Inspectors. Price Inspectors, Superimendents of freed Records and Agriculture, and in responsible pasts in the Department of fand Recards and Agriculture. The clerical and superiment establishments controlled in his own office and on Garcinnent forms by the imputy Director of Agriculture should be restricted from agriculturally trained mean shore prospects of promotion should not be infector to the prospects of promotion should not be infector to the prospects of mean who join the Rorenne service. join the florence service.
- should not be inferior to the prospects of men who join the Revenue syrthe.

  "32. It is necessary to explain the term "grieval medical trained". The Romany University gives a degree in agriculture. The sollable has recently been revised and the past test suffered. In order to gain the degree a thorough procure in out-duor or field knowledge is more fally as escential to the student as book or class-moon harning. The course extends over three years. A student must past the Provious Uzammation, which is a higher test than Matriculation, before he can enter the agricultural course in the College of science, Point Tais prelliminary test is the second for students who group for other University examinations. The first before he can past to the strain must past three University examinations. The first before he can past to the strain science, the second before he can past to the third year's course, the shird in order to get the degree. The practical training can adequately be given at the Poons Gavernment Farm (on which are rendentled quarters for students) and by seconsions. As far as possible object become plots are arranged annotally, to fundinairo students with numerous fell and graren cope of the Presidency and the contituous under which they are successfully grown, and farrier to ellustrate, practically in the field, the class-room teaching. There is a complete collection of indigenous agricultural in plements at the farm and an excellent numerum edicated and agricultural and equipment at the College of Science are sufficient.
- sufficient.

  "33 The Bombay Government has roled that in future Agricultural degree-believe shall get a bioresions must be because Society to precisely the same footing as other University degree-believe. The effect has bom that the agricultural closes at the College of Science have revised. They had described to a single student 1840. Further pointed in 1840, and I understant that IS new students along it foot the month (factory 1904). Postar well be a course of twining for other processes well as hemdly and furge the med of a present along reparting the employment of the three to all great research particularly in

Mr.
J. Mollison.

- the Department of Land Records and Agriculturs. In the latter Department, even in Bombay, the prespects of graduates in agriculture are indefinite.
- "34. I advocate strongly that Bombay Civilians, after they are, say, a year and a half in the country, be sent to the Deputy Director of Agriculture during the mensoon in Poona for two menths to be taught semething regarding the crops, the limplements, the seils, the cattle and generally regarding the agricultural conditions of the Presidency. I am sure they would find such teaching valuable afterwards in ordinary district routine work."
- 35. It is impossible to state, except in general terms, the increase of produce obtained by the various systems of irrigation throughout the Presidency. The conditions vary extremely between districts as regards the kinds and value of crops, which can be successfully grown, as regards available supplies of manure, as regards the adequacy or precariousness of mater-supply and as regards netual cost of applying irrigation; therefore the question of profits can only be generalised. I am prepared to discuss orally the conditions as they exist in the various districts of the Presidency.
- 36. It can be put in evidence that the supply of water in existing wells has been considerably improved he years of drooght by deepening and by bering in various parts of the Presidency. The Agricoltural Department is, I believe, collecting detailed information. The evidence at hand clearly indicates that owners of existing wells might be helped considerably if proper boring apparatus was made available in the various districts. The rude hering apparatus now in use can only be successfully employed when the substrata are comparatively soft and free from layers of fine sharp sand.
- 37. Reference has already been made in this note to the necessity of extra sopplies of manure for any extended scheme of irrigation. The important question is: "Are such supplies precarable?" It may be answered in the affirmative. There is ovidence at hand that when manure is urgently needed for irrigated crops supplies which are
- ordinarily at hand and not generally used for dry crops, are eagerly in demand for irrigated crops. I can from personal knowledge, state that in every district where well irrigation is extensively practised that the dang and urlae of cattle, litter, leaves, tank mud and other useful organic coatter, household waste and in some out-districts night-soil, are collected with scrupulous cars and are much better coaserved than hefore there was extension of well-irrigation. In the neighbourhood of some large towns poodrotte is freely used for irrigated crops. It is dear where there is great demand, and cheap where the domand is limited. The extension of the important market garden cultivation in the neighbourhood of Surat has been dependent upon supplies of town manure, chiefly endely made pendectte. The stuff is still sold at a cleap rate because applies are yet more than sufficient for requirements. The Bombay Agricultural Departmental experiments with sugarcane at Manjri near Poona have proved that certain elibbe cakes which can be procured in large quantity at cheap rates give better results than the macure cakes in ordinary use. These manure cakes (caster and karanj cakes) are dear because largely in demand for irrigated crops. The cane cultivaters have recognized the epsenal value of the edible cakes referred to, and are now using them in the Poona District as manure for sugarcane. The practice of growing San (Crotolaria juncia) and other legaminous crops, as green manures, will become more common as well-irrigation extende. Everywhere in the Presidency the system is already recognized as a very useful
- I do not think that the cultivators of irrigated crops in the Presidency require to be taught anything regarding the value of rotation as a substitute to some extent for manure. Under canal irrigation probably sugarcane and some other crops are taken too often in sneecesion, but usually under well-irrigation a remarkable knowledge of scientific rotation of crops is shown.
- 38. I have found it convenient to give information regarding the various questions put by the Irrigation Commission in narrative form. I hope I am not out of order in doing so.
- 1. Q. The President.—You have been 11 years in this Presidency, I understand?—Yea, I was first Superintendent of Farms and then Deputy Director of Agriculture in Bombay and now hold a Government of India post.
- 2. Q. Are these farms your creation?—The Surat and Manjri farms are; the Poons farm existed before I came to the country; it has been extended a good deal since to carry on special experiments and special work.
- 3. Q. You say in parograph 5 of your note that the initial cost in deterioining whether a well is likely to yield sweet or brackish water, is small?—Tes, it is trilling in Gujarat but serious in the Decean. In Gujarat you have to dig through comparatively soft soil before you get to the water-bearing stratum; in the Decean you would have to dig first through soft materials and afterwards through hard maram and thap rock, causing great expense. The actual stone or brickwork building is not so expensive in the Decean as in Gujarat because the hard trap takes the place of actual building to some extent in Docan wells. Sometimes a Decean well is only built up in the side on which the leather bag works.
- 4. Q. Supposing an ordinary cultivator wishes to place a well near his villags, how does he set about finding whether the water is salt or sweat?—There would be no great risk in the Deceam, because salt water is rarely met with; in Gujarat there is grave risk in some tracts of getting brackish water, he cannot make certaio, he must do the kachcha work.
- 5. Q. Do you recommend getting boring instruments in each District of a superior kind and a mechanic to work them for the sake of giving this information to the people? I should like to test that plan before it is applied extensively, I should not like to do it wholesale.
- 6. Q. Natives have boring instruments of some sort?— Yes, but they are not applied to initial work, but ln existing wells to despon them and find a lower stratum of water.
- 7. Q. There is no doubt that by the use of Norton's tubes one could find this out?—Yes, specially in Gujarat where it is easy to work in the soit alluvial soil and subsoil.

- 8. Q. We have had a proposition that it would be a good thing to have at each of the District head-quarters being apparatus which could be lent?—Yes, it would be a good thing.
- 9. Q. You eay in paragraph 6, talking of the kachcha wolls "these wells were of course usoless after the following mouseon" and again in paragraph 7 "it is not possible to dig kachcha wells so seconstully in black soil or mixed black soil tracts, because the wells after use for a short period have a tendency to fall in "?—Kachcha wells in allavial soil last until heavy monsoon rains becsen the sides, then they have a tendency to fall in. Kachcha wells in chatta soil on the banks of the Nerbudda and Tapti are dog at a trilling cost every year; the depth to water is sometimes only 12 to 13 feet. The silt of flood water fills most of these wells up anunally.
- 10. Q. (Mr. Ibbetson.)—Have you any tracts in which a kachcha well would last five or six years t—Yes, in parts of the Panch Mahals and in the black soil ports of Ahmadabad, also generally in the Decean kachcha wells would last for some years; the cost of making them pakka would not be great and therefore, there would be no particular advantage in leaving them kachcha ler any length of time.
- 11. Q. (The President.)—Is there may rice irrigation to speak of on wells?—Not much on wells alone, but there is the risk of a tank failing towards the end of the season, and the owner of the crop would be glud to have a well at hand.
- 12. Q. (Mr.; Muir. Mackenzie.)—Do they use wells for rice?—Yes, they do, only us an auxiliary to tank irrigation; if n tank fails rather than lose the crop they would irrigate from wells.
- 13. Q. (The President.)—Do you attach much importance to the extension of tank irrigation and the repair and maintenance of tanks?—Yes, a good deal of importance particularly if the tanks are small and if the people of each village centrol the distribution of water from their own tank; I would consider an extension of small tanks thus used much more important than the extension of large tank irrigation which could not be equally well controlled by village communities.

- 14. Q. Still the water lasts longer in a big tank? I have on bug tanks in the Discoun where the disaltrantages outweigh the airaniage you refer to.
- reign the arrainace you reter to.

  15. Q. Of course the ire of the twiks must depend upon the configoration of the ground?—Qulie so, not so much in tinjuist, because it is a comparatively level tract. In almost any position you could make a tank if you could get a little flow of water, because the depth of black soil is such that you could remove a foot of the surface soil without location the fertility.
- 16 Q. I suppres you would count upon cultivating the bel of the tank when the water is off?—As a matter of fact this is not an ancommon practice in the Presidency.
  - this is not an uncommon practice in the Presidency.

    17. Q. You say in paragraph 11 "the deep alluvium of Kuira and Ahmalahal, particularly if sandy in character, needs water very frequently, and a single loss will not irripate more than 2 acros." And again in paragraph 13 "in the famine year it was possible to irrighte from a two-loss well three crops on three different areas covering allogether 10 or 12 across of ground." I suppose a double-los well would do twice as much work as a single one?—Yes, if the lead is near, each Kor would, if the water hats, irrigate 6 across hetween Spiembor and the following May. Three crops, each accupying 2 acros, would be taken in succession on different atters commanded by the same well.

    18. Q. Would that he a Kor working day and night?—
- 18. Q. Would that be a Now working day and night ?— Yes, but only towards the end of the season, but not necessarily between September and February.
- 10. Q. Did the level of water in the wells sink much in 19. Q. Did the level of water in the wells sink much in the famine?—In the famme yest one season's drought did not materially lower the depth of water in the older and better wells in the deep showing tract of Kaira and Ahmalabad and the Panch Mahals.
- 10 Q. (Mr. Mair-Mackenzie).—Do you say that from personal observation?—Yes, one year's drought does not diminish the supply until the following hot weather, in the allowing tract. In the black soil the supply did fail.
- the allarvial tract. In the black soil the supply did fail.

  21. Q. (The President).—You say in paragraph 12" tha fodder produced from well-arrigated crops throughout northern (injuret in 1890-1900 was the means of keeping aliverang of the exitle which survived the famine;" what happened to the exitle where there was no well-irrigation f—They mostly died. We have in the Hombay Presidency 4 mills n less eathle than there was in 1843-97, the traffic in lindes in diajurat and adjoining Natire States in the famine year indicated that the chief less which countril that year occurred in these parts. Our census, which was taken in June, indicated than nearly 70 per cent, of the Kaira, Ahmalabad and Panch Alufuls eathed died and that is, I consider, an underestimate, probably lefore the raise came more cattle died. The change from dry fielder to green lood at that particular serion is so were that it is the cases of mortality in any year and was grobubly the cases of great mortality in the funito year with the cattle sere muca reduced in condition.

  22. Q. You say in paragraph 14 "throughout Broach
- with the caths were much resuced in condition.

  22. Q. You say in paragraph 14 "throughout Broach campling the alberth bett along the Tapti and the sandy belt at me the coast, the soil is deep black cotten soil. On such land rice bids have been succe-fully formed and irrigated by cillage tanks and more could be formed. The soil is entirely unsuitable for the cultivation of ether crops.". Is the still upon the allurial traits sitable for Irrigation F— In is well prefected by irrigation from shallow wells now.
- 24, Q. Her wide is this belt?-Not u mile wide; the hyrboids belt is wider.
- 124. Q. Worll the allurial tract on the Nerbudda be ledeling a could led in term narrow. A could would do to tarm. I think a surroy should be made. I am not very a time to such that the whole trach. I should say the varent is such that it is not worth whole to construct a cared a could be a construct a cared a cared and the construct a cared a cared a care of a construct a which are dug every year, or on higher lank by place and which are dug every year, or on higher lank by place and a construct a cared and a construct a cared and a construct a cared a construct a cared and a construct a cared a ca 24. Q. Would the alluvial tract on the Nerbudda
- 21. Q. Hara you seen anything of the pumps for raising series in a myers? I know a little about them but 1 121
- 21. G. le l'is exercin e cling into segre l'eref.-At Naveste, l'Esche bisto territory, e man interde to d'en figil- in 1,21 vig.
- 27. Q. Do yea led are in it in-Yea, if the coil is rollable.
- 2. A. W. Chi should responsed—Pred in expression; and it is the source of the four halos or principle exceeds a first of the four halos of principles and defined an expedit printless any defined an expedit printless any defined an expedit printless and defined and defined an expedit printless and defined an expedit printless and defined and defined an expedit printless and defined and defined an expedit printless and defined and defined an expedit printless and defined and defined an expedit printless and defined an expedit printless and defined an expedit printless and defined an expedit printless and defined and defined an expedit printless and defin

- 29. Q. I understand that you think on thick will rice Me, can be striggted with a transport-Yes, by means of small J. Mellis tacks.
- SO. Q. Could it be irrigated by a coual f—Not with a learning of a may part of tinjural, because such irrigation would spail mare land than would be under size. By lest-age from the canal, I should expect water-legicing and salt efforce water, and I also think that the people would get use canal water so economically as well as tank water for rice.
- 31. Q. The question is whether rou can utilize the water of these rivers ar should you allow it in go in the sea?—I should be sony to see a large scheme tried in either lireach or Surat; I would rather see its water wated than used there; I should espect that a good deal of land would go out of cultivation and that a good deal of land wend be spoiled.
- SS. Q. Water-logging can be remedied by draluage f-Sill you have the extra capense of drains, the chances are that open drains would want to be chared every year. They would be filled up with black soil. That has been our experience on the Sorat farm.
- experience on the Surat farm.

  33. Q. Still It is just a matter of mency with your I should be very sorry to see a canal carried where we have black soil, especially for rice cultivation; pure black soil is absolutely unsuitable for any irrigated crop except rice. Deep black soil, as you find it senerally in timigrat and in practically the whole of Bronch, holds when wet a large quantity of water and the sub-soils are of clay-like character and therefore inspersions to unisture; when you have that combination, the conditions are such that no irrigated capp can be successfully grown except rice. There are in the Surat District restricted areas of soil which is irrigated has soil of this class. We have found that the value of the caps grown under well irrigation these not warrant the expenditure incurred for deep wells, heavy dressings of manure and drainage. No ordinary cultivator would have incurred the expenditure to exquire into the means
- 33. Q. Our particular object is to enquire into the means of protection against famine; it is a serious responsibility to reject two large rivers?—I can only say that according to my convinced helist enoal irrigation for rice in the black soil parts of Gujarat will do no good. It will probably do harm and I should be sorry to accept the ricks. The case is entirely different in respect of the allurial soils of Northern Gujarat and of Barod's territory.
- 35. Q. Have you seen the irrigation in the Madras deltas i-No.
- Mr. Rajaratna Mdlr.-The soil there is not trun
- 36. Q. Do you know the Tapti district !- Yes.
- 37. Q. What is the soil like?—The soil throughout \$7. Q. What is the soil like?—The soil throughout that in Broach, then you get into uplands where the black cotton soil is 3 feet deep or less overlying murain. On the black soil along the Tapli it is only possible to grow ruli crop, because the soil give as sodden that in Mary crop will grow. In this river-side tract rabi dry composit wheat grain, and lineed are taken in rotation. Khaudesh is a Mary district except in this belt.

  38. Q. (Persident)—I understand that while deep least
- 38. Q. (President)—I understand that while down here in Brosch and Sorat there is a belt of alluvist soil which stands irrigation, further up the river-side belt consists of deep black soilt—Yes.
- 3P. Q. Is it asle to irrigate on goraf land ?-Yes, perfeetly sife.
- 40. Q. Do you know unrthing of the proposed irrigation works of the Salarmati ?—Na.
  - 41. Q. Hare you seen the Hathmatif-No.
  - 42. Q. Nor the Kinel cuts f-No.
- 43. Q. Have been pureled how it is that in this country there is very little transition bestoned on coltent; in Frynt it is a ligity impact copy, why is that full ground cotton differs in variety from any lodigenous ladien mainly; that may be one reston.
- 41. Q. It is not impossible to irrigate critica in this matrix !- If a may goes to for intention at all, he selects country full a may goes in for injection at all, he selects copy which will pay better than cotton, anch as parden ere; •.
- 45. Q. In Egyphyon could not possibly graw ention without a part deal of intigations—in Tayle you are dealing with allowed a ll, in the Bouley President the course if is chiefly blat, but which does not write in the

10 Dec. 01.

- J. Mollison. hat it cannot possibly do without it?—That country has very little rainfall, Broach has a rainfall of over 40 inches, I should say that the circumstances are such that you require irrigation in Egypt but not here, with the rainfall that is
  - 47. Q. Do tanks ever get brackish?—Not in my experience, but I caunot speak positively.
  - 48. Q. You say in paragraph 17, "the information given in the foregoing paragraphs in reference to the various districts of Gujarat indicates that considerable extension af irrigation is practicable; there are, however, risks which must be kept well in view." To what do you specially allude ?-To the risk of getting salt water in the wells for
  - 49. Q Have you had any exporience of the effects of drainage on water-logged land?—No, I should like to try the experiment. In one taluka of Sarat a good deal of land has gone out of cultivation owing to the affect of waterland has gone ont in comparison owing to the sirect of water-logging. In this water-logged area the orops are not so valuables and more risky to grow than those on drier land; people have been compelled to grow rabi orops instead of kharf. I don't see any reason why, by drainage or other improvements, land that has get out of cultivation should not be successfully brought under cultivation again.
    - 50. Q. What is the talaka you spoke of ? Olpad.
  - 51. Q. Can one buy artificial manure here and is it within the range of the cultivator's parse?—Oil-cakes and other indigenous maunres can be honght,
  - 52. Q. Dues it pay to buy them ?—Yes, we have made experiments with sugar-cane which prove that certain edible cakes which are not used as mannro are more effective than nanure cakes in ordinary use and can be bought at cheaper market rates. People do not generally know that these edible cakes are valuable as manure. Oil cakes can easily be broken up into powder for use as monure under the mill stone which is used in every village for making mortar.
  - 53. Q. Do you believe that, generally, throaghout the country it would pay the cultivators to use oil cakes and other indigenous coacontrated manures?—Yes; certainly for irrigated crops.
  - 54. Q. Are oil oakes manufactured largely?—Yes, in every village, the oil 18 used as food, the cakes are used as food for milk and work cattle locally and are experted also They can be stored for any ordinary length of time as cattle food.
  - 55. Q. There is no want of them in the country?-If there was a large extension of well irrigation. I have no doubt these cakes would got dearer, but we have also san the use of which as green maaure could be extended.
  - 56. Q. (Mr. Ibbetson).—You mean the yellow pea which we call sanai in Northern India? With us san is n mallow?—Yee, Mr. Faller told use that the cultivatore in Central India object to grow this crop on account of caste prejadice, but there is nothing of this in the Bombay Presidency. In various parts of the Presidency when the need of mannre arises the cultivators save up night
  - 57. Q. (Mr. Muir-Mackenzie).—Would it pay to use oil-cake manure on cotton crops?—No.
    - 58. Q. Cotton orope grow well after san? Yes.
    - 59. Q. The practice of using san is not common ?-No.
  - 60. Q. (The President.)—Taking all these things into account, what do you think would be the most indicious course for the Government to take to fortify the country against the bad effects of another famine?—I would extend wells in every snitable position, provided it was certain that all the manner required would be available, that all the hullook and mannal labour necessary could be commended and that the men who owned these wells had sufficient capital on credit to do full justice to the work.
  - 61. Q. These are important conditions, I suppose it follows that well irrigation in any tract would never rise to 20 per cont. of the tract?—If it rises to 10 per cent. I should be glad.
  - 62. Q. That is the best that can be offered ?—In Gnjarat on black soil the extension of small tunks for rice would be extremely important. I see that Mr. Mehta thought that they could not be extended in Broach hocause of the difficulty of labour. I think if the occasion areas that labour would he forthcoming. On the black soil which fringes the Tapti in Khaadesh, where linseed, gram, etc., are grown, the question has been solved, as many hill people from the

- Ghats come down periodically in order to help in the reaping of the crop. I should say that labouring people would he attracted if the work existed.
- 63. Q. (Mr. Higham).—You don't think that the abjection to the extension of irrigation without manner would occur?—Na, I think the manure will be available in reasonable amounts.
- 64. Q. If canal irrigation is introduced on as large an area as 34,000 acres, will manuro be available; you are only epeaking of well irrigation?—Yes, I refer particularly to eufficiency of manuro for well irrigation and hy emall tanks. This is the only description of irrigation I recommend for Chrismet. Gujarat.
- 65. Q. The canal irrigation might rnn ahead of that sapply of manner ?—Yes, there are other serious drawbseks to that, I anticipate the soil being speiled by canal irrigstion.
- 66. Q. Not in all osees?—No, in the Mutha canal irrigated tract of the Poona District manure in sufficient amount is a a lable. The effect of canal irrigation has been that a good deal of the land has already gone out of oulti-vation on necount of water-logging. To my knowledge the crops that are produced in that part new are not nearly so good as they were five vears ago on account of the land being now surcharged with water. The soil is a medium black soil with murain.
- 67. Q. Has not drainage been tried there ?-No, there is no combination between the people who occupy the land, one occupant cares little for the interests of another and the canal irrigation is doing a good deal of harm.
- 63. Q. I suppose from your Poons experience, you think cannal irrigation should not be contemplated in any part of Gujarat?—Not in any part of the black soil of Gujarat. In the alluvial soils it would be useful if the water is regularly distributed and if manure in sufficient quantity is available. I would expect more harm than good by making causes in the black soil part of Ahmadabad. Thowells become periodi-cally salt in the talukus west of Ahmadabad.—If the pro-posed Sabarmati canal passess through these parts salt efforcedness will increase. I have seen a good deal of land which has already gons out, of only increase a account, of which has already gons out of oultivation on account of salt officrescence in these parts.
- 69. Q. (The President).—It has never been drained?—No, I doubt if it would be possible to drain it. The country is very flat and very wet in the rains.
- 70. Q. (Mr. Higham).—In regard to the Brosol District which is, I think, all strong black soil, do you consider that two oultivation in these parts where they have tanks, is more profitable than growing cotton and junri !-- No doubt it is, but then the expenses are more than on dry orope.
- 71. Q. The profits of cultivators on rice would not be greater than growing cotton and junri?—They would, I think, be usually greater, the rice crop would be safer provided it got, late in the season, two or three wateringe in a year of average rainfull.
- 72. Q. I understand on the whole there is greater chance of the outton crop failing than there is of rice, if you have proper tanks ?—Yes, certainly.
- 73. Q. The tanke make it more secure ?-Yes; in Broach and Surat where there is generally too much rain for cotton.
- 74. Q. But not otherwise more profitable to the cultivator?

  —A good crop of tice irrigated from a tank properly manured is worth Rs. 80 to Rs. 100 por acre, an average crop of cotton is not worth more than Rs. 25 to Rs. 30.
- 75. Q. Do you think Government would be juetlied in making tanks or in belping in their construction in the District of Broach ?—Yes, provided they are small and provided cach village controls its own tanks and each community is made responsible for repairs and clearing ac required.
- 76. Q. If more than one village controlled a tank what do you fear ?—Two villages might perhaps pall well togother.
- 77. Q. And in the case of a large tank P-I want to see the people hang together in such a meaner that they would ahealntely control the water, and that every owner of a rics bed gots a fair share of it.
- 78. Q. There is not much scope for extending tanks in reach because the country is so flat?—Still you can improve the position by digging out your rice beds, the depth of the soil in Broach is such that you can afford to dig a foot or two and impound rain water; I should say there is very great scope for that in Broach.
- 79. Q. Would fodder be henefited by irrigation?-Not in ordinary years. In a famino year whon fodder is required free cultiva or who grows garden crops under a well changes

his practice and gr. or folder crops instead, because it page

Sit Q. Ordinatily the cattle Lore are led on grave folder for Xea, also or Larde, stran of all certain and these to tradeer; there is a large growth of grave in the Thana levels, the Dhangs of Sorat and in the ference of the Tapti Valley, but much of it is so infinite in quality that it does not pay to transperi it nee diegetee.

St. Q. Wi ere is the good grass sent to 7—In Northern Gujarat there are very large areas which produce excellent grass. This grass new, to a large extent, goes to waste because the leads of cuttle which graced these lands are dead and no particular transportation takes place. A small quantity of the grass is taken to Pombay. A great deal more transportation could be done.

\$2. Q. There are apple waste lands for the growth of folder?—Yes, ample in Northern Cuprest.

83, Q. It is not necessary to increase the area?-No.

Si. Q. What is the amount of folder that you require to give a pair of fullocks for six monthed—A full grown bulled world sat in the cause of the dry 15 points of grow. On that grown has been world not exactly on account of its innutritions at turn; there should be an addition of 11 to 2 points of oil cake, that would be the amount for stall size if Gujerati bulled:

85. Q. That is for a finjerati bullock, I suppose a smaller hallock would not eat so much !- No.

66. Q. What would be the cost of storing the grass, do you suppose, locally !—On the Charoli l'arm would almostated where no have 600 local of cattle we put up in the year after the famine sufficient to make it certain that the year after the famine sufficient to make it certain that there would be about a full year's apply always in hand; it at cost us at ordinary rates Re. I for 1,300 bundles of ent grave collected in me herp; 1,500 bundles more pratically equivalent to 1,000 jounds of grass; entiting, tring and streams root us Re. I. I got two hand presses from the Forest Department, so that we could press this grass into compute failes. I also got whose which had been previously made. I. The baling cost about Re. I per thousand pounds, in that the total of terms to Re. 2 per thousand pounds, in that the total of terms to Re. 2 per thousand pounds, in would be impossible to keep bales grass safely through the redirary ramfull unless it was protected by corregated from elects. We get up the big Dutch learn using rammar way it has very easy to slow away sufficient supply for the rails for supports and corruptated from for roof, in that way it has very easy to stor away sufficient supply for the eath on the farm. If it pays to do that on a small scale it would pay to do it on a large scale. I advocate storage on a large scale in the Western talkas of Ahmadshad. Lahout scares and if the stuff is kept until the following rains it could be a blat a profit if the rains are farourable.

57. Q. What is the supply at this farm, have you a supply for 12 months:—There is more than a six months supply.

50. Q. However proples for any disposition to preserve folder in that was ?—No, I have not so a singlifyed the kind among ordinary agriculturies; they trust to the average autium form atalog hards being sufficient.

St. Q. You say this grass goes to warte in Northern Comment in there may market for it f-Yes, a certain account, but the stuff is so bully that even in present bulletings we the rulemy better to entry more encounted stuff.

pr. Q. Would have to end it to Doubly !-time in with in Printer of from his 10 to Rs. 11 per thousand rounds and that is inferior to what is produced in Gujurat.

former and the interior to what is produced in Gujurd.

(Mr. History).—Hefore crass using my examinate in,
I should like, as one of the Resonne Mend woll that
Co. mission, to them, you, Mr. Molles in, for your valuable paper; it is, I then him of them, it interesting and

The Q. Beather's the modification after small tanks in the life and only in a summer of the after tanks.

the continues of the state of the continues of the state

Po you think that, if s'uless are provided for the distribution of water, the people would lead to distribute the J. Medica, unter by means of small tanks with less injury to their own in different think so. I win call to mind one particular 10 Dec. 01, tank in the Dharmar District where much darage was den by water-longing.

VS. Q. On a carel in Northern Irdie that I know very well, exactly the same thing happened; water was given profusely, and we bal thousands at acres thrown out of cultivafacely, and we but themesade all acres thrown out of cultiva-tion by mater-legging and sait effectivence. Of late years the canal authorities have restricted the empire of water of each village by giving them pipes of dimensions no calcu-lated as to give just enough water for the land they have to irricate; that restriction, combined with distingue and the realignment of the canal, has removed the end of mater-logging entirely and is gradually reviewing the effort-whee. Do you think among the epople in Proma a similar restric-tion of water could be effected feel should like to see at tailed; there is great room for improvement in the distri-bution of water.

26. Q. I understand your fear is that the people would re-distribute the water fairly !—Yes, and another difficulty !-thatche supply lances, a nelative, ! lance also the December not personal; if there are mealificient Ordober rains the chances are that water will fail when it is not wanted; if you put on the restriction that you make, it might be that the dieds near the canal would get a full supply and others madeble result not. probably would not.

97. Q. Would not the effect of restricting the supply materially be to increase the amount of water, that is, to economies the water and so render the supply less liable to fail?—There is no doubt that a great deal of water goes lo waste now owing to the intermittent system on which it is given and the beggar-my-neighbour system on which it is taken.

98. Q If you restricted the supply and made them economies the water, would it not last longer?—It you were dealing with a village community that might answer; but in the case I refer to the land has gone out of the hands of the community into the hands of speculators and contractors in Peona; these men sub-let it to others; it is very difficult to make the cultivators co-operate in the same may as in an onlinary village community.

onimary village community.

193. Q. Satting aside the contractors for the moment, you seem to have doubts whether you can get the people to distribute their water fairly. If you anticipate that didiculty, on what grounds do you advocte small tanks;—Hecuse you are dealing with one village. Each man would take good care to get a fair share, if the same thing could be done with the restricted supply of a causal, you would have the same result as with one tank.

100 Q. You think if the restricted supply were given to seek rillage separately, there would be no difficulty i-None.

101. Q. My fear is that precisely the same difficulties that you think would arise in the case of large tanks would seem in the case of small tanks ?—I don't Illink so.

103. Q. (Mr. Mair-Marlencie).—Are not the conditions of Poons somewhat poculiar?—Yes, no doubt.

103. Q (Mr. Pbeteen) - What you say applies only to P news - Yes.

101. Q. It would not apply to, say, a causi near Alimadabad?—No

103. Q. I don't quite understurd your point about irrica-tion to black soil; it no black soil, not ray, cannot be irrigated, except for rice. You said you had about ned a miset soil take exceptly at your farm t—There is a description of black soil in the Surat distinct known as Kali Herre that can be irright I with alrantage. It has a prema subsoil. On the Government farm we went to very great expense for wells, manore, drainings; the lighter soil is better snited to paid in a direction.

10°. Q. Istlenea description of Idael, soft that can be fire and with performing in Sant of the not pure the soft, at is allowed to be a fixed to a proceeding underseated, that or it beaten is somethef principal in.

107. Q. (Mr. Mair: Macientel.—On the form were have believed in edge which have done nery well f—At the same time well and no nerv great expense as a gardy hardle at least on the construction of with

J. Mollison.

Deceau and Kathinwar. Provided the soil is thick enough, it is suited for tank irrigation from which there is not the same danger of sult as in well irrigation.

- 109. Q. Whore that seil exists in Gujorat there is donger of ealt ?—Yes.
- 110. Q. Is the areo under it considerable?—Yes, very considerable.
  - 111. Q. Salt would render well irrigation risky ?-Yee.
- 112. Q. Now, returning to the subject of the extension of well irrigation, you say you would be very lucky if you got 10 per cent. of the tract irrigated by wells P—Yes.
- 113. Q. Do you mean 10 per cent. of the whele district or of the area suitable for well irrigation?—Probably 90 per cent. of the Decean is unenitable for well irrigation, 10 psr cent. in a district like Khaira, where the whole truet is suitable for well irrigation, would not be too low.
- 114. Q. Supposing that in Gujarat as o whole you had wells wherever it was advantageous to have them; what portion of Gujarat do you think would be irrigated P—I should not like to commit myself.
- 115. Q. Cortainly much less than one-tenth !-Yes, except Kaira.
- 116. Q. In Knira what would be the meximum that yeu could irrigate from wells ?—I doubt if you could go heyond 10 per cent. on account of the deficiency of the manure.
- 117. Q. You could not have, say, 55 per cent. us in the Punjab?—No, count most he taken of the cost of raising water from deep wells and the need for heavy dressing of monure to make the crops really good and really profitable.
- 118. Q. To take another proposition. Take the kachcha wells that were made in the famine; you say that pakka wells might be made in place of each of them; suppose Government could make these wells pakka by a stroke of the pan, could they at once he used to advantage?—le the manure and inhour sufficient?—I should not like to do it in one year. I chould like to proceed gradually; the manere and lobour would be provided gradually or required.
- 119. Q. The number of wells is steadily increasing in Gujarat year by year, are they not?—I have not the figures, but should imagine there is no doubt of it.
- 120. Q. Do you think the increase in the number of wells is obout as great as the increase in manure and of lahour would allow of heing worked profitably?—No, the increase might be much quicker, but of course there is a limit.
- 121. Q. Po you think there might be a further increase without outrunning the supply of manure and of labour ?—Yes.
- 122. Q Do you think Government should bnild wells?—No, it would be better if the cultivators could be got to do it, making it absolutely certain, that if he means to harrew from Government he will get the whole of the money required.
- 123. Q. The best thing would be to give oultivators all the facilities possible for borrowing ?—Yes.
- 124. Q. Can you snggest anything more?—I think it would help materially, if a oultivator constructed a well (it does not matter whether he borrowed the money or builds it out of his own funds), if a premium were put on each aere that is brought under cultivation in the first year, say from October to March, provided that the water got was eweet and therefore enitable for good grains.
- 125. Q. What sort of premium?—I should not besitate to say Rs. 25 per acre for the first year, that would be shout Rs. 200 for a well.
- 126. Q. The well would cost about Rs. 1,000 or 1,500 ?—Yes.
- 127. Q. Would not that Rs. 200 be thrown away in the case of a mnn who was going to make a well in any onse P—No, he would do more justice to his land and give it more manure, and therefore get good profitable crops at once.
- 128. Q. Ahout smoll tanks, take the case of the repairs that have to be done annully; I have asked many witnesses who know the people well whether they have any hope of getting the people to do these repairs, and the opinion has been overwhelming that practically it is hopeless?—Why?
- 129. Q. Want of combination has been mentioned as one of the reasons?—It could be done more economically by the recole
- 130. Q. I agree that it is the best thing if it is possible, but witnesses tell me it is not ?—I don't ngree with thut. I think the repairs should be done by the people. They should be compelled to do them. At the same time there is

- some risk in clearing out a touk annually; it would held loss woter.
- 131. Q. Why should Government go to the expense of repairing these email tanks. Holf a dozen men would do the work for themselves?—They have no money; besides they have to pay enhanced land revenue, etc.
- 192. Q. As regards the propesal to store hay, how long would it keep if stored ?—An indefinite period if properly huled ond protected.
- 183. Q. You say that the morket price of hay is never lose than Rs 10 to Rs. 11 per thousand pounds in Bombay?
  —Yee.
- 131. Q. What would it east to eend it to Bembay?—I helievo as regarde the Tramway Company that after paying all expenses of baling, etc., in an ordinary year (and they pay for right of cutting grass a good deal more than the Government assessment), it costs thom somewhere between Rs. 8 and Rs. 9 per thousand pounds landed in Bemhay; that emount includes everything; that was my information three or four years ago.
- 135. Q. You say in paragraph 12 "in the famine year (1899-1900) although the general area under irrigation in the Presidency declined, the well-irrigated area increased by chout 100,000 ecres." That was because of the kacheha wells that were added?—Yes.
- 136. Q. To what extent is that land manured?—The monured oreo in Kaira and Ahmadobad is obout 75,000 acres.
- 137. Q. At what season of the year is the mannre opplied?

  —You say the mannre was to spure from dry cultivation owing to the failure of the rains?—In Gnjarat manure is not put into the soil until after the first fall of rain. Tank mud is spread on the surface before the rain, but not firm manure.
- 138. Q. (IIr. Rajaratna Mdlr.).—You referred to the difficulty of precuring manure?—I believe I stated that there are possibilities of promning considerable quantities of manure for any extension of irrigation.
- 139. Q. What are the possibilities?—In certain well irrigated tracts in the Deccan, the necessity for more manure has become evident to the people themselves, and they save up materials which formerly were not used, not as night-soil, household waste, litter and even cattle urine; there are besides other sources of manure that have not yet been fully exploited, such as oil-cakes and green manure.
- 140. Q. Do yeu think the rayats will be able to solve these difficulties?—Yes. In Poone we began to use manures other than the ordinary. For instance we used cotton seed as manure for sugar-cane, and the effects were such es to justify the belief that it would pay the ordinary cultivator to use it; we also used cortain edible cakes that can be obtained at cheaper rates than castor and karanj; those edible oil-cakes con in some Decean Districts be hought at 70 lbs. per rupse; they are richer in nitrogen, etc., than those usually used; they ore not so dear, weight for weight, as the ordinary manure cakes, and me more voluable as manure; chew the people experimentally that these edible cakes are useful and they will use them. We showed their effect in the district and the result is that many oultivators use edible cake who formerly used ordinary cake.
- 141. Q. Are leaves of trees used os manuro here?—No; except in the Kauara District; but san is sometimes ploughed in before plonting sugar-cane and other garden crops. (Guvar, n pulse) is similarly used extensively in Gujarat.
  - 142. Q. Have leaves been tried in the farms !- No.
- 143. Q. Havo you seen the new reservoir constructed of Broach during the famine ?—No.
- 144. Q. There is a large extent of land lying fallow in this Presidency in every district, is that reserved for grazing purposes ?—Yee, in parts of Breach and Surat ordinary dry crop black soil often lies waste for several yeors and grows grass. When broken up and cleaned, the oreps of cotton and juar grown subsequently are uncommonly good for several years.
- 145. Q. (Mr. Muir-Mackenzie).—In regard to fallow we find that in the Sunt District the area cropped is about 480,000 ocres and the fallow land measures about 270,000 acre. In ordinary years is the lotter not more than you would expect?—What are the figures for Brooch?
- Q. Mr Ibbetson. The cropped area of Brouch is 564,000 and fullow 90,000 ceres.
- Witness.—I should expect the real fallow aren to be more in Broach than in the Surat District. Grass lands are prohably included in both d stricts, but the areo of grass waste

in Sarat (which is not necessarily empositable) is greater than in Brosch. A very common tractice in the Broach district is to leave certain land fallow. These lands are fallowed and cleaned in a very thorough way and an increased crop of cuton in the following year is obtained.

140. Q. (Mr. Mrie-MacIenziel — In Ahmedehad there decled the figures:—1,678,000 rupped are and 4,04,000 fallow f—i have no dockt that the follow area includes a good deal of grass land in AhmaJakad.

147. Q. You meen land kept by occuping in his holding ander grassi-Yes, but not necessirily unprofitable

149. Q. In Breach district, we have heard of cotton and rice being grown together !- Yes.

149. Q. Are you familiar with this mixed ctop?—It is a practice common in Broach to grow cotton and rice mixed. It is done simply as a safeguard in ordinary years. If the rainfall is moderate cotton thives; if the rain is very heavy there will be a good crop of rice. The rice is grown mixed in the rows of cotton or in an intermediate raw by itself. raw ly itself.

160. Q. If canal irrigation were applied within the colon area for rice, would a profitable or p of rice he grown f—No, the rice grown with cotton is a special variety which suits the ordinary dry crop system of cultivation. With canal irrigation rice be be would be necessary and a variety, and let be true application and regular irrigation, would be score. be grown.

151. Q. You allade in paragraph 6 of your note to considerable scope for extension of brigation by wells in the alladia plana of Gujarat. For what crops do people take water?—For garden crops in ardinary years; for foddor, mari and food-grain crops in a year of scarcity.

162 Q. They meald not in ordinary years take water for ordinary food crops?—No.

153. Q. Would the difference in yield not be sufficient to par f-It might pay expenses, but east of irrigation is very high and the garden crops pay best.

151. Q. In a district wear the sea, where the cost of carri-age modified is considerable, would imposed manure be of any use to extend the manutial supply?—No, an account of the e st compared with available indigenous supplies.

165. Q. When the indigenous sopply becomes dearer?-

150. Q. Manritius wee large imports of gunna, etc., for engagement—Yes, on account of the scarcity of the independent shiply. We are in a different position in Bombay. We expert loace and oil-cakes. The latterespecially would be kept in the cruatry if there was any particular need of manue for extension of brighted crops.

manusc for extension of irrigated crops.

107. Q. Da yau think with the available supplies of minute the lext crops are grown?—In India, in the best erganizate dustriets the value of the crops thus produced postably accords that of the best crops in Mauritine. We have in the Poina district time after time produced crops, yielding 12,000 Hz. of gur per acre, sometimes with 15. 1,000 per acre. In some dustriets well-trigated garden compare often worth 15. 4.00 to 600 per acre. Toose figures indicate that with available supplies of manusc, soil and water can be turned to the v.ry test advantage.

138. Q. If the supplies of indigenous manuras become its elicient and get dear, would the grower of case and garden crops use imported manures?—I suppose so, but at process I see no need of importing any description of man-

150. Q. You have grown sugarcage, have you not, with in pited manute, on the experimental farmed -No.

1.0 Q. Not nitrate of sodal-The crude nitre used is a per duct of the country.

Int. Q. that you think it signable to make an experi-

16.2. Q. Provilly not in the Provincy, but in other parts of india !— Nowlete in India would request a cannot be ordinal for colonialy agreement order at the rotes at militative can be imported, and I do not expert that they exact with

It is, the large execution the Hemographe Mr. Lely to a point of the form handed a well- more very despitable to place. That is the principle. In the Hana Harrage expecting his place is mercues knowledge wells which proceedings in the figure of the first of the fir

10% Q. The results were not different in different tracted d'an attact exterminal attempt the District-of North-to-secistat in the familie year but in the parts I she the receive were good.

163. Q. In the tracts that you saw there was no difference?—No. It would, towever, be easier in a district closed J. Mellison in by fonces like Knira for local effects to find out differences of this sort. I can only say that I saw numerous 10 Dec. of. Lacketa wells and the results were surprisingly good.

160. Q. I understant from Mr. Lagan, Collector of Breach, that a considerable number of Lacketa wells due in the famine were not read this year F.—Kacketa wells in the black cutton soil of lirowh go out of use in a year, because they fall in. I saw lacketa wells in the bel of the Nerbudda in the famine year trigating years. In ordinary years the chief crops grown under them is tobacco. These Nerbudda Lacketa wells are due every year.

There Newbodok lackeds wells are ding every year.

107. Q. (Mr. Heteron).—I understand lackeds wells never last beaund the next monscont.—Kuckeds wells in alluvial soil fall in partially at least after the first monscon rain. A lackeds well in the Decean with trap-nock below may last fer years. It is alvisable, however, that it should be made parlie. In the alluvial soil of longrant the labout expended on a lackeds well is penerally lest if the cer ipant intends afterwards to inske a parlie well. The diameter required for a parlie well is necessarily greater and it would be to there to excivate for a parlie well in in place near the lackeds well than to extend the diameter of the kinkeds well. The below in digging a lackeds well in the libers is not lost because the sub-strata are hard and rocky.

163. Q. (Mr. Muir-Maclenzie). Have the Lackels wells of the Decran, which were due in the famine been kept in neel-I have seen Lackela wells dry ha the Decran and therefore not usel, but if Lackela wells contained sweet water and the soil commoded was suitable for irrigation, I would be surprised if during recent years they were not fully usel.

169. Q. It would not be advisable to give money for constructing wells to cultivature who were not enterprising !-No.

170 Q. Therefore it would not do very much good to give much money to the backward people in the Paach Mahale?-No.

171. Q In paragraph 8 you observe that rainfall is usually insufficient for rice. Would you say that it fails as often as two years out of five t—My experience is that it least certainly done so more frequently than that in the last five years in parts of Gujarat, especially Alumadahad.

172. Q. You say the assessment is a fairly high one: How do you account for the people being able to pay it in spite of its being high?—The seasons during the last five years were very unusual.

173 Q. In ordinary scarons it would fail in two years out of five?—In those parts of Northern Gujarat where rice is grown and the average rainfall is light, and there is no porticular protection from tanks or other source of irrigation. there is certainly a very poor crop or almost total falture of rice two years out of five.

171. Q. How do you account for their being able to pay assessment? —I do not think there is any great difference of assessment between rice fields and dry-crop lands in the particular areas I refer to. Dry crops during recent years have been grown in some rice heds and many rice heds he row waste. The occupants could not possibly have paid assessment out of profits on these rice lands during the last three

175. Q. I understand you to say that there are plenty of sites likely to be available for small tanker—Xes.

176. Q From what have you derived that impression f-

177. Q Do you know this part of the country f---

178. Q. Supposing y a have small tanks, how would you prove it - lity digging mee beds underneath the tanks.

170 Q. By digging out rice bels underneath the tanks you would feeline originion by flow, but you would not store the wife drawing from the exterment?—Not if you wide the lank too high you will swamp as much land above it or you will trijecte below it.

180 Q. Now what would be the effect of this additional "it'r :--Tre anall table would give prode it earre's of weer there waterings in aldition to the ordinary rainfall, and then for moteral of basis gravery midding precations on p they we did have n good one

183. Q How would see assertain the sites of the tark-t-Wly not ord risks surreys.

Mr. 182. Q. You would like to see surveys undertaken P-J. Mollison. Most decidedly as regards tanks.

- 10 Dec. 01.
- 183. Q. Can many more new sites be found?—Yes; and if you put the matter in the hand of a practical man, he could complete his survey probably in one season.
  - 184. Q. Would you prefer to extend and improve the existing tanks ?- There is room for closering a great many of them out certainly.
  - 185. Q. And onlarging them?-I think that a survey should first be undertaken. It is very difficult to give an opinion on a broad question of this sort.
  - 186. Q. Do you think it would be a good thing to encourage the digging of rice beds in black soil by granting takavi?

    —Yes, because with manure, labour and a good position, a very good crop could be growa.
  - 187. Q. Do you think it would be a safeguard against the ordinary fluctuations of rainfall?—Yes, I think so. I think that it would be safer than the cotton crop.
  - 188. Q. Have you seen the Hansot reclamation scheme?—No.
  - 169. Q. They throw a low bund round a large area of land; the object is to allow the rain water to sweeten tho land?—The same practice is followed on tidal creek land further down the coast to exclude sea water. If water at high tides is excluded, the embanked had is gradually sweetoned by the rain.
  - 190. Q. We have been told that brackish water is very often usefully and for barley ?-And also for wheat.
  - 191. Q. The brackish water grows better crops of barley than are grown by sweet water?—Yes, probably.
  - 192. Q. That crop can stand brackish water?—Slight brackishness does not hurt wheat or barley, but really brackish water is specially useful for tobacco only.
  - 193. Q. A number of questions have been asked as to the number of crops and the number of acros irrigated by a single kes. Do you think that a single kes would irrigate six acros?—Yes, if the figure applied to successive crops taken in the irrigating senson and the water lasts through-ont the senson. Three crops can be grown in succession on different areas in the alluvial soil of Gujanat: one kee will irrigate a greator area of mixed black soil than of gorad.
  - 194. Q. Do you think famine labour could be employed to advantage in digging kachcha well. !—I would rather give an advance of Rs. 25 or Rs. 30 and let the cultivator do the work himself.
  - 195. Q. Do you not think a good many famino labourers could be employed at this sort of work?—Yes, probably, but to the work in the particular way he wants it done. If done by himself he would arrange the excavated carth to level his field, to make the slope, and genorally to prepare the field for irrigation. He would, moreover, dig the woll in the position he knows instinctively would be best for his land, and the people he would employ, his relatives and ordinary servants, would be kept off relief works for the time being.
  - 196. Q. Do you think wells constructed by famine labour would be used?—If the occupants of the land dug the wells themselves they would be more likely to be used.
  - 197. Q. With reference to the extension of irrigation by kachcha wells in Ahmadabad and Kaira in the famine year, do you think Government would be well advised to make all these kachcha wells into pakka wells?—Yes, gradually, if the occupants cannot be induced to construct the pakka wells themselves.
  - 198. Q., (Mr. Ibbetson).—If the occupants cannot be duced?—The Government should undertake the construcinduced ?tion, but the people themselves can do the work cheaper.
  - 199. Q. (Mr. Muir-Mackenzie) .- Do you think it would be satisfactory for Government to construct wells ?-- I should rather see the occupants doing such work themselves.
  - 200. Q. Supposing the work of constructing the wells is not proceeding with sufficient rapidity, then you would have the Government stop in ?—I would prefer to try all possible means to encourage the people to do the work themselves.
  - 201. Q. Such wells would be uncommonly useful in ordinary seasons?—Yes.
  - 202. Q. There would be considerable extension of irrigated crops !- Yes.
  - 203. Q. You say there was no scarcity of manure for well irrigated crop, in the famine year in Gujarat. Had not there been a considerable dry crop area sown and the usual application of manure to that area?—Kharif areas were

- sown and manured, but there is also no doubt that the irrigated patches got a full supply of maunre.
- 204. Q. Moro than usual ?-Yes, because more was available.
- 205. Q. You have not seen much of water-logged area.?-No, except in the ceutral part of Olpad.
- 206. Q. Could these water-logged areas be under suitable for rice by drawing flood water into tanks and growing rice under these tanks?—Your suggestion is, I think, a very good one, and I should like to see the experiment thoroughly
- 207. Q. In paragraph 15 of your note you refer to the land being brought under well irrigation since the Revisiou Survey in the Khed Talukn?—You, I saw a number of new wells being constructed and used soon after Revision Survey which was made 10 years ago.
- 208. Q. Why have they used the wells since the Revision Survey and not before?—They were afraid of enhancement of assessment, especially as regards the well-irrigated areas.
- 209. Q. They did not knew that no enhancement was proposed F-I do not thick they did; at any rate they apparently adopted the safe course of waiting in order to see what would happen.
- 210. Q. Do you think that they understand it now ?-I think they do to some extent.
- think they do to some extent.

  211. Q. Woold you prefer permanent exemption of callanoement of assessment on wells or exemption for a term of, say, forty years?—I would prefer permanent exemption in a district well provided with railway and good market communications and where rates are now high.

  212. Q. Do you think the cultivator, who was offered exemption for forty years, would be deterred from digging a well by fear of subsequent enhancement?—No, I do not think so. I think he would have a good deal of scope to recoup himself and repuy any debt he has incurred.
- 213. Q. You say that the removal of a foot or so permanently from the deep soil of Broach improves the position for rice beds and does not lower the fertility of the land. for rice beds and does not lower the fertility of the land. I have been told by the people that the washing away of surface soil by drains spoils the creded areas?—That is quite likely. The weathering effect of sun on the black soil in the hot weather prepares a favourable seed bed. I've drains wash away this favourable seed bed with the first fall of rains. Of course the raw soil then exposed is not a favourable seed bed. I propose the removal of surface soil for rice beds once for all and the favourable weathering action goes on annually afterwards. weathering action goes on annually afterwards.
- 214. Q. You say there are various reasons why well irrigation caused be in discriminately extended; and that it must be resleicted to certain areas where suitable sub-soil conditions exist. Would you take no steps to ascertain that beforehand?—I would have a survey and put the work in the hands of a practical man who would do a good deal by eye inspection?
- 215. Q. Would you like to see the data collected by the Survey Department, especially on points of level and as regards the quality of the water to be made use of?—Such data will help the Surveyor materially.
- 216. Q. How soon would you begin in a famino year to advance takavi for kachcha wells !—In September or Octo-
  - 217. Q. The second-half of September?-Yes.
- 218. Q. Do you know anything of the experiments conducted by Mr. That of Bombay in regard to horing in his Navsari laud 9—No, I don't, but I do know that borings in several wells in the Surat District resulted in tapping water at a lower level and that the water thus got rose in the wells and increased the supply very considerably.
- 219. Q. Is it necessary to have expensive tools for that purpose; would the country-made tools not do?-That is a question for an Engineer to answer.
- 220. Q. What happened in the boring trials which recently were tried at the Sarat Farm with country-made tools?—In one well the results were very satisfactory, in another smaller well the trial was unsuccessful. A layer of sand was met with, and it was found impossible to serew the borer through this sand. With better apparatus the trial would prohably have been successful. I do not know whether better apparatus could locally be made or not.
- 221. Q. You had a considerable amount of success with your imperfect apparatus ?-Yes, certainly.
- 222. Q. Do you think it is possible to educate people in the storage of manure particularly in the conserving of

urine?—They do not know much about it row; but if the necessity areas for monoring an brigated crop, the necessary amount of manure will be forth coming.

- 223. Q. They save wine?—To a certain extent, but the force of cuttle shale are not likely to be generally public forcel and drained, and this is the only way to race all
- 221. Q. In the famine of 1829 there was a terrible folder 231. Q. In the famine of 10.2 thete was a termine to der famine and no grass was previously stored; do you think it is alreadle to employ famine labour in storing grass?—
  I suggested that course to the Commissioner, Northern livision, as I to the Collector of Ahme labod, but nothing was done. If the work 1st been moderable its grass, which was assistable in large quantities, could easily have been sold at a protet in Bomber.
- 225. Q. Is greated and to any extent anywhere in the President; Nowhere that I know of except in Homeley and in Military Contonments and by contractors, and such stacks are often proposely burnt to raise prices.
- 226. Q. Would the lealing of a canal into tracts not alterater favorable for not inigation, be of value in ancetening the well- and increasing the amount of mater-supply in the will?—Yes: the mater level in the existing wells in the Pount Detri ; is much high r than it used to be but this is an accomposiment to make of canal mater and mater begins a personal mater. and mater-logging on low-lying near.
- 227. Q. Hare you found that the tanks have the effect of sweetening the water of wells in their vicinity?—I have not observed it.
- 228, Q. I find you estimate the average yield of the wheat in Ahmalahal to be 1700 lbs, per nere for irrigated land and 560 lbs, finto unirrigated P—Yes.
- 223. Q. Would the irrigated crop get more manure than be unirrigated?—Unirrigated crops got no manure at all the unirrigated ?practically.
- 2.10 Q. It is used more extensively for irrigated than rulerigated traps?—Yes In Northern Gujarat a well brigated whest crop, if well menured, may yield 2,000 to 3,000 its per acre of grain, but there is considerable risk of
  - 231. Q. I find that in Ahme hagns we had in-

1595-1536 . 67,000 acres irrigated from wells, 1897-1897 . 120,000 ... 1897-1900 . 101,000 ...

Do son think the 101.0's acres would be kept up !- The area will be kept up and extend with a return to years of munes reinfall. In the last four years the rainfall has been deferent. It is certain that we seem as the wells contain a good supply of water the unitation will increase.

202 Q. In Poora yes had in-

1495-1896 . 65,000 acres uniquied from wells, . 61.00 .. . 60.000 ... 1594-1607 14 1595-1509 11 1899-1900 . 67,2\*\*\* ... \*\*

Notwithstanding that, you hope if it an increased area will be meintained ?- Yes.

- 223. Q. Also in Sholaper and Nasik !- Yes
- 231. Q. The increwe in Poent is elight?-Many of the is canal mater the people do not nea them.
  - 235. Q. Take the canal in Poena. Yen had-

Je 1905-96 . . 31,071 Actes infinated . Brillett . 25,664 . .. ., 18,7568 . . 34)60 a legion . . 31 10 1

How do you second for that?—It is very difficult to answer that question without folly straights it. J. Mollie -

230. Q. Would you prefer small tanks to large for 10 Dec 0; rada sull, or do you refer to tlack soil only !- West soil 10 Dec 0; chiculy.

- 237. Q. Would the present he a very good time for pushing the extension of well's!—Not the people are hard up; they have not yet recovered from the ewests of the famble, and I do not think that they have the means to do much thereafter. They have no cattle and no money.
- 238. Q. Do you think that the a luministration should not be discounged if their efforts are not such that one of an one f-Gradual efforts for well extension should be trule.
- 232. Q. Do yen think people would be built to be encouraged. If Government alcance i money to dig wells and charged a larger if an enumer i instead of taking lack the alvance?—When call rather apply for tall will they are not certain that they will got all the money and for.

  240. Q. What do con mean?—They are not some that it endeance will reach them. They are red suce that if Government advances them has been their will get the whole a mount. Then they are not some eyen time.

- 211. Q. They might apply quiekly f-There are objections to thing father; the people has prefer to per heaver interest elsewhere if they do not actually get the whole sum from Government. The current belief is that a good deal "sticks" in the kands of the subordinate service.
- 212. Q. I suggest language assessment of Rs. 6 or Rs. 10 per acre as extra assessment for the well, instead of repayment of principal and interest for laterif—I would prefer the payment of interest and refund of advance during a long term of years.
- 243. Q. Why?-Recurse in that eye the people know precisely where they are, and can calculate definitely whether it will pay them to take the money or not.
- 211. Q. If you take a single well it would pay so much for area irrigaled by one Jost There is speculation shout
  - 215. Q. Where P-I should prefer Interest.
- 216. Q Why ! I want your reasons, Trey might agree to any h-gayat mies calculated on actual advance of money Covernment if they were certain of getting the whole of the money.
  - 217. Q. They prefer talmif -Yes.
  - 215. Q. Do you think they prefer long in talments :-
  - 219. Q. More than twenty years?-No.
- 250. Q. (Mr. Hibrison).—One core question Woold you tell us whether in the tracts of Gujarst, where there are neither tanks nor wells, the average sice crup is a peop one's—Yes, in the poorer parts, i.e., in the Mehmadab id taluka of Kaira district and in the western villages of Ahmadabad is inducible new. It is decidedly poor.
- 231. Q. Even in those parts where rainfull is mere reliable the existence of small tanks would largely increase the average yield?—Unquestionably, if the tanks can give two or three waterings in the second.
- 252. Q. Could you give us any very rough estimate of the average value of the yield without tanks as a galact the average with tanks. By what proportion would tanks increase the average yield i-Double, at any rate, in the case of a liberally cultivated crop.
- 253. Q. It has been reggested to us that it does not increase it by more than 11 to 10. Do you think it at estimate is inserrect?—Certainly, manure and two or three waterings at the coll of the acasen would double the enturn in ray opinien.

There is a demand for tank water, during the southwest monsoon particularly, when the min ceases too cerly or there is a very long break. Rice is practically the only crop dependent on tank irrigation; it requires two to three waterings between June and October. The last flooding is must important, because it ensures a good harvost of rice and a second crop of val (large-fruited dolichos). Sugarcane has to be watered three times a menth during the hot weather; it takes about eleven months to come to maturity and has to be watered at intervals during all that time (the raius excepted). There is no official control over the distribution of water from irrigation tanks, each man taking the water when he wants it. Irrigation revenue is realised in the form of onhanced assessment.

- 3. Small tanks in black soil hold water well enough us a rule; masonry core walls are not used in this district, so far as I am aware. Even in case of good and seasonable rainfall there would be a demand for water for ruce. The irrigation revenue from tanks is a fixed item, being paid whether water is taken or not. Rice is very commonly grown in black soil and it is for ruce oultwation that tank irrigation is resorted to in this district.
- 4. The existing Government Irrigation Works consist of 702 tanks, of which 287 irrigate each 20 neres and more and 70 Government wells. The normal area nuder irrigation from the tanks is 12,362 neres and from the wells 1,475 acres. There are no statistics available to determine the range of variation. Neither tanks nor wells are to be depended on in a acasen of drought, the tanks even in a good year seldom contain water much beyond December and wells run low in a season of drought. The Tapti Canal Scheme and the proposed Utova and Amba Párdi Tanks bave been munuted on by Mr. Beale. I may note that the Ulpád branch would traverse part of a waterlogged aree. Semothing on a smell scale might be done in the way of bunding up the rivers and etreams of the district, but the repair of the existing tanks is the most pressing reatter.
  - 5. There are no Provincial Irrigation Works.
- 6. The present irrrigation works are all of old standing, duting back probably to the ante-British period; us now works are constructed now-a-days. The old works are repaired as necessity arises and funds permit, by the Publio Works Department, who are kept informed of the state of the tanks by the Revenue Department. The number of these works, etc., has been given in paragraph 2. During the last six years less than Rs. 10,000 a year has been spent on the up-keep of irrigation tanks, and of this Rs. 10,000 the rayats contributed nearly Rs. 1,500. Government is supposed to maintain the tanks in officient order; the himayat (water-rate) would only be remitted when a tank is absolutely useless and there is no intention of repairing it. I may quote the following from the despatch of the Secretary of State on the report of the original settlement of Jalaipur (paragraph 4):—"There can be no doubt, as Mr. Hope remarks, of the obligation incurred by Government to maintain the supply of water for lands on which, in consideration of that emply being exceptional, they have imposed an exceptionally high rate of assessment, and it is of the first importance that the Government should not be justly liable to the imputation of a breach of faith with respect to this obligation." I am not in favour of district funds, as a rule (certainly, it is so in this district), are all required for roads, schools and other legitimate objects of Local Fund expenditures. I nm not exaggorating when I say thut, so far as my experience goes, not one tank in two is in good condition; I am strongly in favour of devoting more money und greater attention to the np-keep of the existing tanks; the construction of new tanks is desirable, but this can etand over till the old ones ere in repair. This district is pretty well off for tanks and the provision of new ones is not an

urgent matter. The villagers often depend on the irrigation tank to supply water for mon and cattle, and even if there are tanks and wells for donestic purposes, the irrigation tanks are a nesculstand by. Ordinarily the village water-supply is ansilicient.

- 7. The number of pakka wells is estimated at 5,726; there are also between 500 and 600 kachcha wells. Each well irrigates about 3 neres; the area under irrigation in an ordinary year does not differ appreciably from the area in a year of drought. About 35 new wells have been constructed annually during the last ten years, half by the aid of takavi grants. A reduction in the rate of interest, and an extension of the period of recovery would possibly atimulate the construction of new wells; the present period (20 years) seems to me long caough, but the interest (5 per cent.) might be reduced. The water level of the wells has sunk owing to the droughts of 1800—1901, but there has been no wide-spread failure of the water-supply. Some ran dry and were deepened with more or less farourable results. The depth of water below the surface varies from 25 feet in the cast villages of Olpád táluka to 80 feet in some parts of the Bulsár tuluka: 35 would probably be the average depth for the district. An irrigation well costs from Rs. 300—500 and protects three acros.
- 8. Part of the cast of Olpád táluka, some 20,000 acres is affected by water-logging and some drainage cheunela have been ent; others are proposed, but the report on those already mede is not favourable. At present remissions are being granted to the extent of Rs. 8,700, and proposals lavolving remission of Rs. 22,000 are before Government. It would, therefore, pay Government to earry out any works which would reduce the extent of the ovil at a reasonable cost.

## II.

## A .- General.

- 1. I have served in the Snrat District for four years. My personal experience is confined, however, to the talukus of Chorasi and Julalpur.
  - 2. Table \* attached.
- 3. There is no obslacle to the extension of irrigation from any of the causes mentioned.
- 4. Under the Bembay Land Revenue Code increese in the value of the Lind due to private improvements is not taken into account in revising the assessment.
- 5. Leans under the Land Improvement Act have only recently become popular owing to the bad years; the tightness of money during recent years has driven the rayat from the savkar to Government. I am in favour of a reduction of the rate of interest.
- 6. The state of things contemplated in this question is impossible in this district.

## D.-Tanks.

- 23. The tanks are supplied from the catchment area by naturel drainage; the water is distributed by means of earthenware pipes let into the bank, but occasionally the embankment is ent. The supply is maintained till March in a year of ample rainfall; till the beginning of October in a year of scanty rainfall. It a year of drought the tank would never fill. Statistics are being collected to ascertain the mea ordinarily irrigated.
- 24. In this district it is usual to grow rice followed by val (deliches lablab) and divel (caster-oil): these are the only crops grown by tank irrigation. In a year of ample rainfall rice requires irrigation to yield a full crop; in a year of scauty rainfall there would be no crop at all without irrigation; in a year of drought there would be no irrigation.
- 25. If the supply commences too late there will be difficulty in transplanting the seedlings, as they will be on mature to be transplanted; if the supply ceases too early, then the crop will fail, as rice requires its last watering in October, and there will be no chance of a second crop of val-divel.
- 26. Lands irrigated from tanks are not irrigated also from wells.
- 28. The irrigation rate is peid in the form of onhancement of land revenue; on an average it is Rs. 4 per acre. It is paid on the whole irrigable area.
- 29. Little private expenditure is necessary, the cultivator does porsonelly all that is required. In a few cases one or two men are kept through the monsoon to see to the distribution of the water in the rice fields and ere paid in

kind fere candoad of rise by the people who use the

- 83. There are no mointenance charges; periodical repoles are executed as required and as londs permit. The average amount spent in repairs per acre irrigated is anno 13 pies & during the last six years.
  - 31. There are no private tanks in this district.
  - 32. There is no scope for this.
- 33. The tanks of the district silt up slowly; no statis-tics of silt appropriation are available. The silt is removed by expansion uten preventy.

## E - Wells.

F.—Welle.

\$4. Throughest the district, except in parts of Parli and Meddin, the average water-level is 35 in 40 feet below the surface of the germod, the water itself being six to ten feet deep. The supply Is chiefly from springs: in an ordinary year the wills last out easily and do not run dry in a year of decught. In the part of the district where irrigation wells are need, the mater does not ordinarily become salide. A well costs about Rs. 5(0), and with due attention will last 100 years and more. The water is raised by Lex (leather lag); the area commanded by a well is the land

- mithin 100 and 200 parts of it; the accracy area into Mr. J. J. C. ented to 3 acres gated in 3 some
- 75. As a role only one only is taken off land irrigated on welled in this district it is largely angainst or registered. The energy under wells are irrigated whatever the rainfall may be.
- 37. The owner of a well juys authors to Guteroment; a cultivator pays substill water assessment if his land has facilities for water whether he have well or not.
- SS. Serious difficulties are not exemptered in the selec-tion of a spot for a well, nor in the actual construction. No axistance is given by Government or local ledge.
- 39. I am not in farour of the coestruction by Government of wells in land savour of the construction by Govern-ment of wells in land which is private property, at least in this district. The cultivater can built a well considerable cheaper than the Public Works Department, and the takari system is the only form of Government I elp rejuited. If the well belonged to Government and the land were thrown up, there would be a dead less to Government.
- 40 Temporary wells are not commonly used in this district; a few were made in the famine sear, but in black soil they are not feasible, and this district consists principally of black soil.
- 1. Q. (The President)-You are Acting Collector of Surat !- Yes.
- 2. Q. Haw long have you held that office !- I have been Acting Collector for the last even months.
- 3. Q. You were here throughout the famine !- I was nel in a famine charge.
- 4. Q. You talk about irrigation by Government wells; what are they ?—They were caust veted many years and; I don't think any of them were built in our time.
- 5 Q. How are they managed now f-They are not managed at all 1 they are there, and if water is taken from them, we charge for that.
  - 6. Q. They are all Government wells f-Yes.
- 7. Q. Is there any demand for it; is there any enthusiasm about it among the people?—I den't think the people have alout it; I don't think there will be a beary demand.
- S. Q. Could you tell vs about the Amba Pardi tank? What is the history of the project?—It is a scheme that Geremment has only just northed out; it is entirely for famine labour. When Government were rather hand proceed, they found that this part of the taluka was the most in want of some relief works, and as the soil is suitable. for irrigation, they considered this project favourably.
- 9. Q. Is it suitable for rice irrigation F-I fancy so, it ere is also some black soil there.
- 10. Q. Has an impotes been given to well construc-tion during the famine i-A root marked imposes.
- 11. Q. You have many applications for taken advances row f.—There is not a great demand; there was a demand in the famine year. I think the demand now is better than it was before the famine.
- 12. Q. In the famine year the demand was largely for to-tria wilsi-To since extent.
- 13. Q. Do you attach much importance to the extension of well trigation !- Not as much as to the extension of tral, intigation.
- 11. Q. De you think there would be much stimulus if thisti advances were given in a clinterest before a far for farming would be considerable risk.
- 15. Q. (Mr. II eterni-Himf-l'ople monid apple win did not polly nagt it; there noull be a considerable rol of miss plients n of wedge.
- 10. Q. Y. n High the poly encell apply who did not not the many i-There were also a strong temperature for people to sok for more than they notice wated; there we did not property erest all outside in failing outsided or a man at that put the 200 today at the 500 to fix 400.
- 17. Q : The Provident)—In the interests of famire protected it is important to increase the another of medianne little with first or only will on foregoith-inversel. Wouldn't have some effect f-I think was

- 18. Q. Suppose we made another proposal, i.e. give taken to and have it regard by increased assessment on the land?—That is in one respect going lack to the old system of Government wells which has been alandened; I think the present system is the best.
- 19. Q. (The President)—Would you allow him to repay money by yearly payments of enhanced assessment?—That would be a permanent assessment on a private well; I think there would be tendency to fight thy of totavi under those conditions.
- 20. Q. (Mr. Muir-Mackenzie) Do you see any objection to the experiment being tried! No.
- 21. Q. What number of years do you generally allow for the recovery of takavi f-If it is Re 500, I take it in ten rests; not more than ien generally
  - 22 Q. The law allows 20 years !- Yes.
- 23. Q. Would it not be a popular measure to allow 20 years.—The meat would naturally prefer to extend the period of instalments.
- 24 Q. (Mr. Rhelson)—Would be not have to pay more interest?—There is a tendency to ask for as long a period of instalments as they can get-
- 25. Q. (The President)-You attach more importance to tanks than to wells ?- Certainly.
- 26. Q. (Mr. Mbetsan)—Why?—Recause one of the principal crops is rice, and they rever cultivate rice under
- 27. Q (The President)—linve you recent to believe that there is from for a large extension of tanks in your district?—In the Jalalpur Talaka, with which I am best acquainted, I do not think there is. There are quive as many traks as are required.
- 28. Q Do you consider that not one tank is in post condition f-Nearly so.
- 23 Q. I would gather from the tenor of your note that you consider that the first step to be taken to prepare the district against famire is to put the tanks in order r-Yer; and then make new tanks if you like.
- 80 Q. What is the extent of irrigation from tanks? Tanks of less than 20 acres irrigate 8,000 acres, of more than 20 acres, 10,000 series or 21,000 neres in all.
- 3t. Q. If the tanks are put into preper order, you would probably licence this are if—Yes, considerably a but it would still be small be proportion to the cultivable area.
- 52. Q. What measures would you adopt for the pro-vision of folder at the time of famines—from my experience of the last famine. I think, there would be little demonstry in this district, as the amount of land to der press is considerable, and there are forests closely.
- 23. Q. You think that familie labour could be better refered in eleving tanks than read-anthlops—Yes, there all he a large return to Government.
- 31. Q. (Mr. IPer, n)—We all there he a return to G reported of the tools we excluded—Yes, there will be an increase I mount of acceptant.

10 11/2 01.

Mr. J. A. G. 35. Q. Would there not be an increased assessment on the additional erea cultivated after clearing out the tanks?

— Yes.

10 Dsc. 01.

- 36. Q. Where wet assessment was paid where there was no water it has now been taken off?—I do not know.
- 27. Q. Are you of opinion that land which was assessed wet and does not how get water should cease to pay the assessment?—Yss.
- 33. Q. If you improve the water-supply, is Government ontitled to impose more assessment?—Yes.
- 39. Q. You say you are not in favour of District Funds heing expended on irrigation works?—Yes.
- 40. Q. There are a number of small traks; suppose Government were to assign the revenue to the District Beards, do you think they would manage these small tanks and keep them in repair?—No, the District Beard would not be a good agency; besides the revenue derived from these tanks goes to the expenses of the additional establishment required to maintain them.
- 41. Q. Do you think the people could maintain the tanks?—Yes, they could do it in some villages.
- 42. Q. You connot work through Patels !- No, excepting some very good Patels.
- 43. Q. Why ?-In some villages there are rival parties, and they would never work hermonicasly.
- 44. Q. You say a report was made against the dminage channel in the Olpad Taluka; what was the complaint?—The people complained about the scouring of the surface of the soil, and an officer was deputed to make inquiries.
- 45. Q. He came to the conclusion that the complaint of the people was justified?—Yes, it was well founded.
- 46. Q. I understand there has been no famine in your district for 63 years ?—That is not quite correct; there was famine to a considerable extent in the Maudri Taluka; there was famine also in Olpad and in the south of the district.
  - 47. Q. Was it sovers ?- Very severe in Mandyi.
- 48. Q. Not elsewhere ?—I do not know, I am speaking from what I have read.
- 49. Q. Have you got records of previous faminee in this district P—Not for the last 60 or 70 years, doring which there was no famine; there was only scarcity. Surat has always been free from famine till the last three years.
- 50. Q. Under these circumstances, would you spend money on protecting Surat P-No.
- 51. Q. You could not tell how many walls were dug in that part of Surat where there was famine f—I could not.
- 52. Q. (Mr. Rajaratna Mdlr.)—You say the District Boards will not be able to manage the tanks, and that the people would not he willing to help them. Would you like to transfer the management to the Revenue Department? Do you know whether the Revenus Department would be able to undertake the repairs, if funds were forthceming—some hody must repair them?—I do not see what agency could be employed.
- 53. Q. Iu the Madras Presidency, tank irrigation is under the management of the Revenue Officers?—We too should have a special establishment for that purpose.
- 54. Q. In that case the Revenus Department would be able to undertake the management of this work?—Osrtpialy,

- 55. Q. You ebject to the Public Works Department cerrying out this work ?—Yes, because it is not worth the cost.
- 56. Q. In paragraph 4 you say "the normal area under irrigation from tanks is 12,362 acres and from wells 1,475 acres."—These are old figures; they are not to be absolutely depended upon.
- 57. Q. Do you not measure the area svery year ?-Not actually.
- 58. Q. Was any remission granted on wet lands during the lest famine, under tanks which ran dry ?—Not specially on wet lauds; if a man had not the meens to pay the assessment he received remission whether his lands were wet or dry.
- 59. Q. Is there any reason to believe that the probability of the had assessment being liable to be enhanced at the next revision of settlement, prevents the people from digging wells?—I doubt it; I have never heard of it until I heard it in evidence here.
- 60. Q. In paragraph 37 you say "the owner of a well pays nothing to Government; a cultivator pays sub-soil water essessment, if his land has facilities for water, whether he has a well or not." Does the sub-soil rate vary in different localities?—I do not know what the sub-soil rates are. They vary with the character of the suh-seil
- 61. Q. (Mr. Muir-Mackenzie)—I understand you to say that the area under rice which receives assistance from tanks is probably about 23,600 acres?—Yes.
- 62. Q. The total area of rice in normal years is 106,000 acres?—I make it 80,000; it fluctuetes.
- 63. Q. I have get 106,100, from the agricultural statistics of the Government of Indis. Supposing it to be 80,000, do you think it would be advisable to have tanks constructed in order to possibly improve, or at my rate gnard, ngainst a fluctuation of the water-supply of the remaining 60,000 acres ?—Yes.
- 64. Q. Do you think there are many sites for these tauks ?—I do not think there are many sites.
- 65. Q. Would tauks be no good along the sea coast ?—I do not think so, I doubt it.
- 66. Q. Suppose, for the sake of argument, that the excess of what is called untanked rice over tanked rice is very considerable in the Chikbli Taluka, don't you think it might be likely to find sites in that taluka?—I know very little of Chikhli Taluka, but you might make tanks there as it is a billy country.
- 67. Q. In paragraph 8 of your memorandum you say "at present remissions are heing granted to the extent of Rs. 81,7C0, and proposals involving remission of Rs. 22,000 are before Gevernment." That means that, if we could remedy this water-logged condition, we might possibly get back that amount of revenue; it would be worth while to spend a good deal for that P—Yes.
  - 68. Q. Have you seen any of the drains?-Yes.
- 69. Q. Havs you noticed any sign of their had effects?
- 70. Q. Do you know anything of the proposed reclamation schemes?—Yes; I have seen one.
  - 71. Q. Is that the reclamation of the tidal area?-Yes,
- 72. Q. You don't know of any reclamation to onre salt apart from shutting out tide?—No.

# WITNESS No. 94.—BRIKHUBHAI AKHUBHAI, Bulsar Teluka.

Answers to printed questions.

Mr. I am now 55 years of age, and I am engaged in agri-Bhikhubhai culture for ell my life.

Baikhubhai.

10 Dec. 01

3. (1) No.

(2) Cattle not eufficient; mors required.

- (3) Manure, as at present obtained, will be insufficient.
  (4) The laud consists of black, gorat, dadri (stony).
- Black soil is not much suited to irrigation.

  (5) Yes. It will be a bar if the supply is uncertain, sto.
- (6) Yes. Lack of capital; there can be found one or more cultivators in each village to undertake cultivation by irrigation.
- (7) No.
- (8) None.
- (9) Nene.
- 4. I constructed a new tank, area one acrs, last year, which irrigotes merely four acres, but at the revision survey my jarayat land has been assessed to kiari land.

It was thus not exempted from enhancement.

The assessment of my jarayat lend, which was Rs. 1-8-0 per acre, bas been raised to Rs. 4-0-0.

No,

Mr. Britactra

If Greenment agree not to enhance assessment, say, for a period of 100 years, people will be induced to use private engila.

5. No con takes takevi for anch purpues, as irrigation on an extensive scale is not in existence in this district.

It should be publicly annuanced to the villagers that takari can te go: for irrigation.

- (1) 500,
- (2) Yes.
- (3) Yes.
- (1) Yes. (5) Yes.
- (6) Yes.
- G. No. A few persons may be induced to seek the indicated areas.

Yes. People have strong desire to extend irrigation.

- 23. (1) Natural, by rain water from adjacent lands.
- (2) In low-lying lands by word suplas or by loss.
- (3) (a) April to May.
- (5) November.
- (a) July or America.
- (1) It depends on the nature of the sail. To irrigate one note of tand from June to November the area of the tank should be three seres.
- 24. (2) It depends upon the value of the crop. Say, if sugarcane is grown the value of the produce will increase by Rs. 50 per acre.
  - (3) (a) One acre will produce 200 manuals of molarses.
  - (b) Fifty mounds prace.
  - (c) A77.
- When the tank water fails, as the crop will 25. Yes. fail but for the well water.
- 27. Cannot say, as there is no proper irrigation.
- 28. None exists.
- 29. It depends upon the distance that water is situated.
- It will be from Rs. 25 to its. 30 for the reason.
- 50. A few tanke which irrigate more than 20 acres are repaired at the expense of the State, the villagers contri-bute 10 per cent. of the expenses. No arrangement is made to clear six nor any watch kept.
  - 31. None exist.

- 32. Yes. Government should give land free and advance money as taland without interest.
- 23. Tes. Cappel say, but it may be about five feet although as within the years. It depends on the nature of the sill No deed fing or other continuous is and yield. I would 10 Dec. Ct. propose that same arrangement should be under to fill up table. I tellers there are rules in the Public Works Defaurment to provide water to table. Some arrangement should be made by which more water can be carried to the table.
  - 34. (1) From 45 to 60 feet.
  - (2) By springs and by percolations
  - (a) Yes.
  - W Yes
  - (3) Ila. 5"0 to Re. 600.
- (1) Up to 100 years if sweet, or else 25 years.
- (3) By Los.
- (7) From three to four serve, and much depends upon the depth of the water.
  - 35. (1) 13.
  - (2) None.
  - (3) (a) One hundred per cent.
  - (b) Fifty do.
  - (c) A71.
- 37. (1) For bagayet double.
- (2) Less than double on the area of land netually bris galed.
  - 39. (I) No.
  - (2) Yes, n little,

None.

Yes.

- 39. No. If Government can give a well free of cost, Government will like to give water to others as the well would belong to them, and this is objectionable.
- 40. Very soldom. To a great extent. If Government can give money. Also at the revision the arresement was not raised on account of kartela wells?

The talaxi should be given at once. There is a great delay which endes out much of the advantages.

There are small rivers in the talula lwhich, if bunded, will benefit the cultivators greatly. There is a spring near the Parners which, if bunded, will benefit many villages.

Artesian wells should be enenuraged.

- 1. Q. (The Precident through an Interpreter)-What land do you pre-cee?-Eighty nores.
- 2. Q. What is the land used for ?- For cultivation of regelables and chilles.
- 8. Q From we h?-From wells and tanks.
- 4. Q. Have you got sice also?-Yes, 2) arres.
- 6. Q. Is all that O'nerror nee? Yes; of the rest same is me calcivated and some calcivated; a portion is reserved for grave.
- 6. Q. Dil you find the grave modul for the cattle during the last year of de nglith-Yes, I was a ble to keep my cattle alire.
- 7. Q. Dil the cattle die much in your taluka?-Yes, in later nur.bers.
- 8. Q. Il warang mel'elave you got!-Two.
- 9. Q. In every village elete is an increase in well irri-
- 10. Q. They build we'll from talker advances for Yes. from taker preads and also from their new recourses
- D. Q. The manner at present obtainable is brand'elent for a languagese in the uses orbiteated for Tex.
- 12 Q Where do you get your memor from ; from earth-f-You; I have get not open carelo. 17 Q. De you know southing about manner as all cased -We want to very plants a to the want of tomory we count there are expenses and each manner.
- IL Q In appeter in the even Growing Thomas I face a atomic desirate extenders put of familiating families put to be a no water and they now really that impation would be a krest been

- 15. Q. How do they show their "strong desire;" by taking takavi advances?-Yes.
- 16. Q. But you say only few takars a lyances are taken where there is the strong desire f-l'cople are afraid of taking talari.
- 17. Q. Why F-If a man is not able to repay the Gar-ernment instalments when they fall due, the whole debt is collected from him at once.
- 18. Q. Has that ever happened full as said that measures will be taken to recover the amount at orce. know of no specific instances.
- 19. Q. You say" the talast should be given at once Turne is great delay which tales out much of the advantages" What are these delays?—Hour applications for taken are granted we get the mency after six months.
- 23. Q. Why so long as that?—Inquiries are made through talules and villages by the Mambalar ple relimite life separt to the telah a theory who refers the matter to the Celletter; and so the cultivator who applies for taken does not get it in time.
- 21. Q. (Mr. Histor)—You say that your hand assessment use raised from Ba 1-5 to Ra. 4 in the revision of estilement; have you improved your help thy was it mainth—license I madence Alari land. I converted depote plants into similards. If I make a tool at the next remains of a thomas that tank will be changed for.
- 22 Q. Do you knew that amording to law you con-not be clarged on the fact it—Trace is a sillore near Lab-jorn in the Polish Taloia where on lat has been a tack Gra-cumment have bried water government to asset the land also i.kirria

Mr

- 23. Q. You say at the original settlement the assess-Bhikhubhai mont was not raised on kachcha wells; was it raised on Akhubhai. pakka wells?—A sub-soil rote was charged.
- 10 Dec. 01. 24. Q. It is charged on kachcha walls clso?—Yes; the well as on other louds which adjoined to it owing to the sabsoil water.
  - 25. Q. Do you mean to say that if a man makes o well he gots his own assessment raised and also that of his neighbours?—Yes, if he has a well in his lond, on the land adjoining to his land, within 80 chains of his well, the water rate is levied.
  - 26. Q. Suppose there had been no well, would the subsoil rate have been charged?—Yes.
  - 27. Q. You say you would like Government to moke n well in your land free of cost headese the well would belong to you. Snppose Government gave the well to you ond then levied a wet ossessment, whot would you say to that !—I would not like that.
  - 28. Q. Why?-Beeanse the assessment would be reised permanently.
  - 20. Q. (Mr. Rajaraina Mdlr.)-You referred to a tank; was it constructed in your own land or in Goveroment land ?-In my own private land.
  - 30. Q. Did you opply for permission to construct the tonk !-- No.
  - 31. Q. What crops do you grow on the land irrigated by the tank?—First I sow rice; afterwards either sugarcane or chillies or brinjals if there is sufficient water.
  - 32. Q. Do you irrigate the rice crop also?—Yes; when there is no min I utilize water from that tank to irrigate riee.
  - 33. Q. Havo you an ombankment along the rice lands? -Yos.
    - 34. Q. When were your wells dug?-In 1671.
    - 35. Q. After the original settlement?-Yes.
  - 36. Q. How many acres can you irrigate from your two wells?—One or two nores.
  - 37. Q. What assessment did you pay on these lands before the Revision of Settlement?—Ro. 1 per acro.
  - 38. Q. What was the obsessment at the Revision?-Rs. 4 per ocre.
    - 39. Q. It was roised from Ro 1 to Rs. 4?—Yes.

- 40. Q. You hove got a tonk os well as wells situated in the same field P-Yes.
- 41. Q. The land irrigated by wells can also be irrigated by the tank f-Yes; water in the wells was not sufficient this year so I irrigated from the tonk.
- 42. Q. Under the Rovision of Settlement the ossessment was raised from Ro. 1-8 to Rs. 4?—Yes.
- 48. Q. (Mr. Muir-Mackenzie)—Do you know anything about selling grass in Bembay !- I do not sell gross; whot I have I reserve for my cattle.
- 44. Q. Did you grow any crops from your wells in the femine year of 1899?—No.
- 45. Q. You did not use your well at all?—No, because there was very little fodder and if I had used my cattle they would have died.
- 46. Q. These two wells were dug out of your own money?—One was dug out of my own money, and I got the other well with the field which I purchased.
- 47. Q. Purchased out of your own meney, or did you borrow the money?—My own money.
- 48. Q. If you want to borrow mency to make a woll what rote of interest have you to pay to the bania?—Six per cent.
- 49. Q. Would you like to see more tanks made in your taluka by Government for rice?—It would be very beneficial; there is special necessity for more tanks.
- 50. Q. There are many places in which tanks could be made?—All the land belongs to Government; if Government wish to dig a tank they can acquire the land. There are plenty of sites.
- 51. Q. Do you know many other people besides yourself who have dag tanks of their own ?—If people were not afraid of Government raising the assessment they would build many more tanks.
- 52. Q. You say you pay Rs. 4 on these new kiari lands; what was the rate ou the old rice lands?—Rs. 12 or 13 per acro.
  - 53. Q. On old kiari londs !- Yes.
- 54. Q. You now pay Rs. 4?-Yes; my lond was jarayat.
- 55. Q. On new kiari land you pay very much less than on the old kiari?—It is less than the old kiari rate but the land is poor.

Witkess No. 35.—Kuan Samed D. Dudnithmor Bilimonia, Mambidar, Ankleshwar. Answers to printed questions.

D. Dhunjibhoy.

  15 Andádá.

- The bulk of the land consists of black soil, but in the morginollyneted villages, there is o very large area of Gorndu land which is suitable for producing irrigated crops.
  In the black soil cotton, juor

and til are largely grown.

The principal crops grown are juor, cotton and til. They do not require irrigation except in years of drought or scanty reinfall. Rice is elso grown in this toluké which require to be irrigated, but the Kiari land is dependent on tanks, the water of which is sufficient in years of ordinary rainfall.

In some places wheat ond gram are grown when there is sufficient moisture in the land ond so the crops do not require to be irrigated in ordinary years.

The minfall during the last 11 years in the taluka is given in the accompanying statement. It seems that in this taluka there is in some years domand for water during sonth-west monsoon.

The crops in this talnka are irrigated from tanks and wells. The crops irrigated from tanks is chiolly rice.

The crops irrigated from wells are sugorcano, ginger, onion, wheat, and other vegetables. Irrigated crops from wells are raised in the 16 villages mentioned above. In the other villoges there is hardly ony well used for irrigntion purposes.

Only those fields which are assessed to tank water assessment ore privileged to toke water from the tonk and the tonk water ossessment is consolidated with the assessment of the soil.

At the time of the introduction of the present survey a special water-rate was assessed on lond liable to be irrigated from wells, and all land so assessed can toke water from the well. This well woter assessment is else censelidated with the assessment of the soil. In the revision survey

this woll woter assessment will be obolished and oll land, whether heeded by wells or not, is to be assessed with sub-soil water essessment.

3. If in block cotton soil tanks be excavated, till yellow earth is reached, they can hold water. If such tanks be engelmend they can be of no need unless the Jardynt land surroundling it be converted into Misti land.

Klari land sum in ling tanks is the only land irrigated in all land swing that rell and in years of fair or good rainfall, there is no falling off in the arm irrigated and the revenue is not proceeding because people have to pay the mater assessment whether they take water or not.

Owners of Unik call desire to have more tanks, he they can convert durant land surrounling new tanks into Kinries, and such tanks if constructed are expected to be as monumentary and as important as the tanks now in

		•			
5.	•		•	•	6

6. All tanks are in existence from time immemental. They are control'd by Government. In this talaki there are in all 11st tanks which pay bringstien revenue, the area spread being \$10 area and 26 guntles.

As Generation have record a material on a certain number of fields, it is their duty to ese that the tanks are maintained and repaired to such an extent that all fields aures il nu ler ti em cen obtain unter.

Ercluding expenditure on rebel norks during late famines it is east that Government hardly incur any annual expenditure on such tanks.

Except during the last two years hardly any remission of the last base been given in other years of scanty rainfull. No new works of this class have been constructed of late years. District Local Boards or private owners have not undertaken such works. It is not desirable that District funds should be expended on such works. It has not been the practice for Government to encourage the construction of such works by leaves to District Boards or to land-owners. They receive value of these works can be increased by dividing to be money and greater attention to their up-keep. These works are also very useful as they supply water for money and cytile.

7. In pursyaph 2 has been given the total area irrigated by welle in ordinary years (1895-99 and 1895-1891) and in the year of drought (1895-1800). The number of new wells constructed annually during the last 10 years is as

Except in the 15 rillages mentioned above, it is not pos-sible or desirable to reimplate the construction of rew nells by more liberal alrances or inducements for the following reacons-

- (1) Wells are required to be due very deep.
- (2) The mater obtained is often salt or turns out salt after some years.
- (3) Prequestly a stratum of partly called Kohada interrenes which it is very difficult to dig out.
- (1) The wells do not last for a long time.
- (6) The water-enpply is not sufficient.
- (6) Much of the water is wasted as the land Irrigated
- (7) Anyhow the people do not desire to construct wells in the villages of black soil as the product of the irrigated crop is madequate to the cost

Almost all the wells for irrigation purposes are situated in the 15 villages mentioned above, and although people have constructed new wells in these villages recently, they have not borrowed money from Government. Meet of the wells last to be deepened owing to the recent droughts, and as the rainful in 1900-1901 was scauty the supply of water in the wells is still deficient.

No well is said to have fallen into disuse owing to the droughts.

In the Geradu villages the total average depth of the wells is 25 to 40 feet and 50 to 55 feet in villages having black soil. The average rost of construction is Re, 600 in villages of Gonain land. In villages of black soil a very few wells were constructed but they fell into discovery every soon.

In this inluke almost oil wells have one kee and the average area at ached to and commanded by a nell is 7 ners, and the average area irrigated by a well in anyone year is 4 ners.

1. Panel. 2. Chapta. 3. Achieber. 4. Unarwick 5. Ale-j. 6. Fairur. 7. Karmill. 6. Revin. 10. Pardi Idrie. 11. Hardin. 12. Achieb. 13. Achieb. 13. Achieb. 14. Achieb. 15. Achieb. 15. Sarti 16. Sorti 17. Varia. 17. Varia. 17. Varia. 18. Dail.	8. In the villages noted in the margin lands are water-log-god, and therefore addition drinage works are required all Government cost. If suitable drainage works to provided and repared occasionally, waste land is likely to be taken up for entities for and the revenue of the water-logged occupied land mould be assured.
--	--

2. Relief labour was employed on the expansion of tanks and knobleds roads and collecting stone in the European Score of the knobleds made undertaken more left uncompleted. Village tanks excurated contain more water than usual and have thus proved beneficial to the people for matering cattle as well as for irrigating Risri lands.

## H .1 -General.

- 3. The answers below refer to Ankleshwar Salzaka of the Brooch Metrick. I have been serving as Mambadar of this teloka for the had \$1 moddle.
- 2 The arrespe mickel in each month of the year has been placed it read of the accompanying statement.
- 5 (1) and (2) for the resume given in paragraph & G. B. For 1216, I am and in favour elecustrating more wells in the Mach well utilizers. If water can be obtained by for

from tonks and canalass very large saws of land one to irregard with the present population and the present stock of bullecia.

of pairwise.

(b) In Israe towns, must of the non-aminutualite base exists for describing pages on and the people of neighboring without can these taken a supplie of majour from these what it shall not the roun. It is said that if from he shall the plants out down and wattered on the land after sime days, it would supply so folice transce. Apple, had soon with the does not implie to be majored sent

D. Dhunji: year. Again, people oan purchase castor-oil oakes which is bhoy.

- 10 Dec. 01.
- (4) The bulk of the land in this talnka is black cotton soil, and it is said that it is not unsuitable to irrigation, for, besides the crops of juar, ootton and til, other irrigated orops can be raised on such land.
  - (5) If canals of continuous flow be constructed (if feasible) leading from the rivers Nerbudda, Tapti and Kim, there will be no obstacle to the extension of irrigation by these means.
  - (6) Cultivation of irrigated crops is costly, but if advances be made for a few years, people will be able to continue such cultivation with their own means.
  - (7) Poople do not auticipate that there will be any perceptible increase in the assessment, or in reat by the extension of irrigation, beyond the water-rate they will have to rev.

(8) There is no uncertainty of tennre as regards Government land, end cultivators, though they mortgage their land to Sowkars, enlivate it themselves. Again, Sowkars are now parting with the land in their possession.

4. Land irrigated from works constructed by private capital are exempted from enhancement of assessment on account of the irrigation.

No tenant in this taluka has constructed any irrigation work in his holding.

- 5. Leans under the Land Improvement Leans Act are not freely taken by the people as will be seen from paragraph 7, G. R. No. 2275. For the reasons given in the same paragraph, I do not propose to give takavi for wells to the black soit villages. In the 15 villages mentioned in paragraph 2, G. R. No. 2275, all the wells are situated, and the people of these villages do not berrow money from Gevernment for that purpose.
- 6. Except tanks and wells in the 15 villages near the river Norbadda, there are no irrigation workslin this taluka, I therefore cannot say whether the extension of irrigation tends to injure the remaining cultivation by attracting its oultivators to the irrigated tracts.

People of this taluka have oviaced their desire to have firstly, canals, and secondly, tanks.

# D.-Tanks.

23.

- (1) The tanks in this taluka are supplied with rain water.
- (2) Only that land which is assessed to tank water assessment is privileged to take water from the tank. In big tanks pipes are laid for taking water, which can be obtained by flow, as long as the level of water is above the pipe. Again, water can be taken by removing earth from the banks and repairing the breakages at the expense of the person thus taking water. But if water be very low, as is the ease in years of scanty rainfall, it can only be obtained by lift, which process is both expensive and laborious.

(3)

- (a) In a year of ample rainfall water is sufficient for the monsoon crop, and another irrigated crop can also be raised in the same land even without water.
- (b) In a year of seanty rainfall the water hardly suffices for all the land assessed under the tank, and if there be no late rain, no irrigated crop can be raised.
- (c) In a year of drought, the water does not suffice for the ordinary monseon erop, viz., rice, but owners of some of the neighbouring fields can utilize the water available for growing crops of juar, bajri, etc., or fodder crops.
- (4) The area ordinarily irrigated from a tank depends upon the size of the tank, the quantity of water available and the degree of facility offered for taking water such as lift or flow.

26. In this talnka there is hardly any well in or near the land assessed under the tank.

(1) In this taluka, all tanks belong to Government, and the average water-rate levied by Government unnually is Rs. 4 per acre.

- (2) I do not think that the cultivator of land assessed with tank water assessment has to pay more rent.
- (3) No more, beyond the water-rate mentioned in paragraph (1) is to be paid to Government.

The rate is paid on the total area of land assessed to tank water assessment.

29. The expenditure for bringing water to the field varies with the distance of the field from the tank. It also depends on the way in which water is taken, that is, by lift or llow.

The expenditure is generally incurred by the person who cultivates the laud, and he is bound to pay rent to the owner of the land, whether he receives water from the tank or not.

30. As regards watching no ostablishment is required. Irrigation tanks have been occasionally repaired, and silt has been removed, from Local funds or Provincial revenue, but not completely and not to the satisfaction of the people.

The approximate annual cost per aero irrigated varies from Rs. 25 to Rs. 30 including the price of manure.

At present tanks are not repaired to the extent to which they may hold as much water as may be required for irrigating all the fields assessed under them, and so some arrangement should be made to repair them occasionally, in order that all fields assessed under them can obtain water.

- 31. In this taluka there is no tank constructed by a private person or persons.
- 32. I do not consider it advisable to encourage and assist the construction by private persons of further tanks.
- 33. Tanks are liable to silt up, and therefore do not contain the quantity of water required in all the fields assessed under it. Some tanks have silted up so mueb so that they retain hardly any water. The silt is removed by oxeavation. Hitherto proper care does not seem to have been taken to provent the silting up of tanks.

# E .- Wells.

34.

- (1) Vide paragraph 7, G. R. No. 2275.
- (2) Almost all wells in this taluka are in the 15 villages of Goradn land. They obtain water from springs, but water drags with it a large quantity of sand, and it is thorefore necessary to clean these wells very often. These wells are not liable to fail or to become too saline to use in ordinary years or in years of drought.
  - (3) Vide paragraph 7, G. R. No. 2275.
- (4) The average duration of a well depends upon the occasional repairs. If the wells be repaired frequently they may last for many years, at least up to 100 years.
  - (5) Water from wells in this talnka is usually raised by water lifts\* made of skin drawn by bullooks.
  - (6) and (7) Fide paragraph 7, G. R. No. 2275.

37. At the time of the old settlement, the irrigation capacity of each well was tested, and an area of land hauded by the well, varying with the size of, and the quantity of water in, the well, was assessed to the well water assessment.

All land assessed ander the well, whether water be taken or not, has to pay a water assessment of Rs. 3 per aero to Government.

If an aero of land with a well be rented, the rent to be paid is about Rs. 3 more on account of the well water (vide paragraphs 2 and 7, G. R. No. 2276).

- 38. In black soil, people seldom dig wells, and in Geradu land serious difficulties are not to be encountered in the selection of the spot and in the actual construction of the well (vide paragraph 7, G. R. No. 2275).
- 39. Except in the 15 villages near the rivor Norbadda, wells if constructed in other villages are not romancrative. I am therefore not in favour of constructing wells by Gororment in private property.
- 40. For the reasons stated in paragraph 7, G. R. No. 2275, temporary wells are not commonly used in this talnka, and it is therefore not necessary to encourage their construction in a year of scanty rainfall.

- 1. Q. (The President;-You are Mamlatdar of Ankleshwarf-Yes.
- 2. Q. How long Lave you held that office?-For the last 11 months.
- 3. Q. Where were you before that !- In the Panch Mabals in the Kalol Taluko.
- 4. Q. Have you been in Gojarst all through your settlee?—Yes.
- 5. Q. Were yoo in the Panch Mahals District during the famine :- Yee.
- G. Q. Was the lamine very had where you were !- It as not so keen in Kalol where I was, as it was in other parts of the Panch Mahais.
- 7. Q. You say that "the creps irrigated from wells are sugarcane, ginger, wheat and vegetables; irrigated erops from wells are raired in the 15 villages mentioned above. In the other villages there are hardly any wells need for irrigation purposes." What is the reason for that?—Hecauce it is there conton soil. I have given my reasons in another pragraph. Wells have to be due very deep. Semetimes a strainm of earth called Keladu is streek which is very deficient to dig. The water supply is very deficient.
- 8. Q. You say "any how the people do not desire to construct wells in the villages of black soil as the produce of the irrigated steps is inadequate to the cost involved "f-Yes ; they do not pry.
- 9. Q. Are there not p'enly of wells exceptlog Goren-ment wells in the other taluts ?—In Surst and Bub's there is no black cotton soil and there are plenty of wells. In Anhlest war faluka it ey are situated in 16 villages only.
- 10. Q. You go on to say "The expenditure is generally incarred by the person who cultivates the land and he is bound to pay rent to the owner of the land whether he receives unter or not "f-Yes; it is not equitable that others should take this water; because these people have to pay arrestment whether they take it or not.
  - 11. Q. How many wells have you in your falula f-217.
- 12. Q. In the 15 villages?—Yes, there are only 4 or 6 in the caltre.
- 12. Q. Then you have got nowin D) wells in each villaged .-- In one village there are about to wells.
- 14. Q. I pather there are enough of wells for the villages f "Yet the people there are better off than other to give; they don't even become movey for constructing with.
- 15. Q. Ven my people in thack cotten will want to have more tucked You, it sy desire to have more tarks.
- 18. Q. Yen barnal operator 110 tanks in the talkin i Yene
- 17. Q. Res much de they intered \$10 arm.

- 18. Q. Are there sites for more tanks f-I have not studied that question. I do not know of any.
- 19. Q. Are these tanks generally very shallow !- Yee. they are silting up.
- 20. Q. When they are filled in the monocon, how long do they last before they become empty f-They last up to Marchil they are properly filled.
- 21. Q. You say in paragraph 8 "In the villages noted in the margin lands are water-logged and therefore additional distings works are required at Government cost"?—Some drainage works do exist.
- 22. Q. Are they working well f-No. I do not think they have done may good since they were made some years ago.
- 23. Q. Are they very old ?- No; they were constructed
- 21. Q. Do people object to the drains!—The people are divided in their opinion; some object to have more drains because, they say, the surface soil is washed away; other people where lands are further off are desireds of laving more draios.
- 23. Q. I suppose Government is remitting the regence on those lands which are water-logged f-Yrs, during the last two years they have done so.
- 26. Q. Are there any places where it might be possible to make large tanks to store waters—No. I have not heard of any.
- 27. Q. You say "It is raid that if hemp to sown and sentered on the land after some days it will supply sufficient manure." Do the people use of she largely for manure?—Trees who are accustomed to irrigate their tends ces it, but it is not largely used.
- 29. Q. It is not need where there is no irrigation f—No; only it see persons who irrigate their lands use it.
- 20. Q. They all know of itf-No; not all classes; because people, like, the delie, are not accord and to irrigation; they simply depend upon measons enga-
- EO. Q. Do you think it would be a good 14 log it famine relief labour was formed out to clean these village tanks f— It would supply sofficent labour.
- 91. Q. (Mr. Rajarstra Milr.)—Her many wells have been constructed during the last five years ?—In the facine you only one well was constructed.
  - 22. Q. The cliens are all o'l we'le ! Yes.
- II. Q. Are there forthilds force retracting more wells?— But the first exists but consists of Floric extreme stand I would be to some end that wells about the contracted tempes they will be page.

WITNESS No. 36 .- Mr. NABBHERAM MUNCHARAM, formerly Mamlatdar of Olpad.

Mr. 1. Q. (Mr. Muir-Mackenzie)—You wore, Mamlatdar of Narbheram Olpad ?—Yos. Muncharam.

2. Q. Do you know the Taluka thoroughly !- Yes.

- 10 Dec. 01. 3. Q. Have you over seen a drain ?-Yes, I saw one in the monsoon of 1900.
  - 4. Q. It was a short mensoon ?-Yes.
  - 5. Q. The drain was empty ?-Yes.
  - 6. Q. Could you tell me whether the people in the neighbourhood were satisfied with the working of the drain Yes, the only people who complain are those who are at the end; they say that the adjoining fields have been washed by the everflewing of the drains. It empties into the Kim.
  - 7. Q. The people near it complain?—Yes, there were various causes of complaint, one is because it takes too much water away when there is ue min.
- 8. Q. They do not want the drain ?-No, because it passes through their fields and they have to give up some of their lands for it; it is constructed, they think, to their prejudice.
- 9. Q. What is your impression of these drains ?-I think they are important and that they do some good.
- 10. Q. Would the surrounding fields be benefited by drains P—Yes, but the area is so far away from the drainage channel that the benefit will be minimised.
- 11. Q. Would you not take the drain into that area?-I do not know what the result will be, because the people are against it, they will resent it if the drain passes through their lands. Their leading members have to give up londs, that is why they complain; that was the conclusion I arrived at from my inquiries.

# TWENTIETH DAY.

# Surat, 11th December 1901.

WITNESS No. 37 .- MB. GOPALJI GULABBHAI, Mamlatdar of Jambusar Taluka, Breach District. Answers to printed questions.

Mr. Gopalji. 11 Dec. 01.

Paragraph I.—There has been but little, very little of irrigation in the talukus wherein I have served as Manulatdar, and so my opportunities of observation have been very limited. But I have had an acquaintance with cultivators, some of whom new and then raised irrigational crops in their fields, or who knew of their wants as agriculturists, and I had had apportunities of sometimes discussing the subject of irrigation with them. As Mamlatdar, I had had also an opportunity of knowing, in a general way, something about irrigational and other lands. It is depending on this so-called knowledge and experience that I have prepared the following notes on points Nos. 2, 8, 6, 7, 8 and 0 out of those mentioned in the Memorandum accompanying the Government Resolution No. 2275, dated 26th October last.

Paragraph II.—The gress area of this taluka is 247,519 aeres and 32 gunthas, and the culturable area is 172,350 aeres and 25 gunthas. About 2,000 aeres ont of the latter area are protected by wells, and about 2,250 nores by small tanks, and about 300 aeres more by other nominal sources of water. There are no Government irrigation works or private works other than wells in this taluka. The soil is of three kinds—(1) the Light brown or allnvial, (2) the Black, and (3) the "Besar" or half-way between the Light and the Black. The cultivation is not at all dependant on artificial irrigation. The average annual rainfall is about 35 inches and extends from Juno to October. During the south-west monsoon there is ordinarily no domand for other water. There are no crops narily no domaid for other water. There are no no crops grown in this taluka such as require irrigation excepting "Dángar" and "Kodrá" which in years of scanty rainfall require to be watered; for this purpose, tank water and well water is sometimes used when it is available, though it is rarely so available. About 150 acres of land are annually grown with "Marchi," Popper, "Ringni," Egglant, "Dangh "Onion and Tobacco, and they are watered to be watered against the law watered every suice the day. by wells. They require to be watered every eighth day. Marchi and Ringni are sown in the mouth of July and require to be watered in this way for four menths after the rains are ever, that is to say, from Nevember to February. "Dungli" is sown in the menths of Nevember and December and require to be watered for five months, that is to say, from November and December to April and May. Tobacco is sown in the month of August and requires to be watered for about three months, that is to say, from November to January. There is no irrigation revenue realized in this taluka.

Paragraph III.—Black soil is not favourable for irrigation. It requires much water and is difficult for weeding and for turning water and other purposes, which require the enlitivator and his men to go into it. It becomes hard and cracked in the fair season and takes in any quantity of water, and when saturated, it becomes so soft and sticky that one cannot tread over it without a good deal of incon-vonience. Small tanks in black soil hold water very well and mere thoroughly than those in light soil, which hold water, only if the bed is of gravel. In the village of Nadiad, which is a Bárá village with black cetten soil, there is a small tank of about 8 acres which is not deep and yet holds water throughout the 12 mouths of the year, notwithstanding it is much used by cattle. The population of the village is very small, but hundreds of outtle and sheep, which come to graze in the waste lands near the village, drink water thereof. In the village of Kapuria, which is also a Bárá village with excellent black cotten soil, there is a tank of about 10 acres, which was got excavated to a little depth at a cost of R500 two years ago, and since then the water therein lasts throughout ago, and since then the water therein lasts throughout the years. The tank of Kareli (a village with light alluvial soil) which is about 12 acres and which was oxenvated deep four years ago, does not hold any water at all, for the

bed being not a gravel one is porous.

High earthen dams can be made of black soil without masonry core walls. They will allow water to percolate for a time, but when settled and overgrown with "Kedra" or other grass, they become strong and will not be other washed away or cracked. Besides, so long as black soil is in touch with water, it will not become porous and will remoin sticky.

The tanks mostly consist of portions of low-lying ground, which are excavated, and where, on account of their low level, monsoon water rushes in from the surrounding high lands, often of a large extent and is collected.

When the land irrigated is black soil, there is not any When the land irrigated is black soil, there is not any demand for water during a season of average rainfull, for, the land, though it wants more water, rotains it longer. For example, tobacce which is grown in the month of August, does not require to be watered nutil November, if it is in black soil, while it requires to be watered in light soil, when the rain helds oil for a time. I cannot say whether the irrigated area in black soil shows a falling of in years of fair or good rainfall, or whother the revenue is on that account more precarious than in the case of other soil commanded by tanks, for there is not much of irrigation in this taluka. There is a desire on the part of owners of black soil rice-lands that there should be more of irrigation works which might water their lands when the rain stops short in the end, and which might ensure their rice crops; in such cases the construction of tanks would be as remunerative and as important as in other classes of soil.

remnnerative and as important as in other classes of soil.

Paragraph VI.—By district and village works, I mean the large tanks which are almost invariably to be found near the site of every village and the small tanks that are to be found in numbers in every village and are supposed to be useful to the surrounding field-owners and their cattle and to irrigate some of the nearest fields—rice plots—on occasions of scanty rainfall in consideration of a small payment.

11.3 "History" or "Kassar" on account of water, which called "Himóyat" or "Kassar" on account of water, which is incorporated with the land revenue proper and is fixed by the Survey Department at the time of the settlement. I believe the levy of this special revenue will be discontinued at the Revision Survey.

It is not known who constructed these tanks. The latter tanks near the village also were, I believe, assurated by the new settlers there exercises here size established the village or by those who postded them there. Then dog the tank and weed the earth to raise its lanks and to raise the village wite to erred houses on them. Every village site has invariably one such tank attached to it. There are also rumere a smaller tanks in every village "Sim" and they are very pointly ember the result of the charity of the reign us and the rich or the toult of the charity of the reign us and the rich or the toult of the charity of the reign us and others coming or cultivating land in the neighborhood. These tanks are all now contribled by Government. There are about 160 of each large tanks and about 500 of such small tanks in this fallage, There is in cultivation entirely dependant on them, in these are about 2,250 seres of had below them, the surrey was extent on which is fixed in consideration of the punicing capacity of the land, jointly with that of the water supply arounds for its irrigation at the time of the scatterious, and in the assumption that that untersemply will be malitained at about the same standard throughout the paintly of the leave. The rates for the use of the weer and if find are, as remarked above, consolidated, and occupants are under the liability to pay the full raise (whether the tanks are in order or not, and whether they have start in them or in the new in their holdings. The lands paying this assessment are almost entirely "Kihiti" or rice-plays.

The obligations of Gorernment, as a great landle of, to maintain in an efficient state these sources of water-supply for the use of which it clustees rent, are manifest. Contivuted that should not therefore he required to contribute any parties of the cost of requiring them. But some assistant a may, in faitness and in accordance with nears, but demanded from them; it will extend to a few days labour before the acting in of the moneon in orch year, for thing rathodes, making up banks were down by cattle traffer, cleaning small water courses and similar petty earth work sepairs. But so far as I know flovenment have not spent any amount on these tanks. Several of these tanks are not worth maintaining as irrigation tanks by Gorenment, and if ey might be left to the cultivators to a mintain or rate as they please, the lands below then being treated for accession as they please, the lands below then being treated for accession as they please, the lands below then being treated for accessional as dry crop lands. The larger tanks used for village water-supply are maintained at the cost of local funds, with such voluntary contributions or other assistance as som be obtained from the villagers, and, when occase on justifies it, by grants-in-aid from the Provincial assignment for the improvement of village-water-supply.

No new morks of this class have been constructed of late many. Direct Leval libraries do not undertake such works, and crivate land-outers also do not do so, though I have the med a sease or two of their digging such small tanks for their convenience—more for the extra mater of their fields to collect as also for the usy of their entitle and themselves, than for irrigational purposes.

Paragraph VII.—To total area irritated by wells, in critorry years, is about 150 eres, and 2,0.0 acres in a year of drought. Not a single new well mas constructed dering the last ten years, excepting 116 wells, which were constructed during the famine year and a few local found wills for driving purposes. Hugos 25,770 were given out as taken for a nervolling new wells during the famine year, the real ring of these wells have been left more or less incompare by the people, most of whom did not want to have more, either because the water of the wells was cet good or been see the wells a treat them purpose, though be complete, we have a location that me the wells a treat the remainered on a few wells by grants of taken—larger in an emit and on wordels treat tensors and about a derivable and have must and on wordels treat tensors and at the a derivable as a location that in this tellah, we so the chances of getting sweet water are surer than in one wells against the chances of petting sweet water are surer than in one will again and where the population is thick. Derived the first large and where the population is thick. Derived the problem of them have me some wells run short and some of them I wance in restricted to a well as kines that we always alont of mater need deposit (and a some of them I wance in some wells as a location of a larger and the water of the result that the water of a larger well as a larger and of the water and a larger and of the water of the result that the water of the result of the states of the result that the water of the states of the result that the water of the states of

Paragonal VIII.—There were complaints from the Mr. 1997 to perfect several village in this tribulate to the effect that inneaded water accomplaintd in their village site and in 11 He m. It is "Sir," that go be not the fields and from the village to another was render. I difficult to that rose in, also that the people soffered in leadth on account of the water, logging around it village site, which offere contained much light from manned and granule and granule where people theyel calls of rainre, and that mea as well as cault suffered thioughout the mineral and granule where people theyel calls of rainre, and that mea as well as cault suffered thioughout the mineral and vater on their delignounds. Alore all crops were also injured by the water legging. The following drainage channels were excitated to remove these difficulties about ten years ago:

- The Amanpor-Nalia! Channel about 6 miles in length, passing through the lands of Amanpor, Tundaj, Rampor, Kara and Nalia h.
- II. The Kern-Madalar Clanntl-
  - (a) passing through the levels of Korn, Panchalds, Sunblandanteen and Madafar,
  - (b) and the Jantinn-Malafar branch, presing through the lands of Jantrin and Malafar, both altegetler 64 miles in length.
- III. The Sindlar Channel drawing the lands of Sindhar.

The following channels were excavated during the famine year, and thereafter as famine relief works; they were also needed on the same account as the above ones:

- I. The Nabir-Unim-Kole-hwar Channel, produg through the lands of Nober, Units and hotesh
  - and the Dablia-Umra branch, passing through the lands of Dables and Umra; both altogether 6 miles in length.
- 11. The Uber-Dabha Channel, 2 miles and 749 feet in length, passing through the lands of Uber and Dabha.
- III. The Nolling-Nober Channel, 5,390 feet in length, passing through the lands of Nollina and Nober.
- IV. The Vad-Madefar Chennel, pusing through the lands of Vad and Madefir.
- V. The Vargetla Channel, 3,100 feet in length, passing through the lands of Vangetta.

Other desinage channels are still required, partly on sautary, but rhiefly on agricultural grounds. They are the following:-

- I. In Hankhi.—The draining rhannel to begin at the entiance of the village of Hankhi, where water accumulates during the mouseon, and to end in the river Dhadhar;
  - this mould save the crops (cotton) of the ficiles on its sides from descriction when the mean are heavy, for they remain under mater; it will also be useful on smitary grounds; this chance would be of about 2 miles in length. About three other smaller chancels, each of about a mile in length, are also wanted in the fields around this sidage, to be as ful to the regile of this village to will as Gajera, Uchiel, Vellam and Jafarpara; the chancele to end either in the Mariael Khadi or in the Khali of Ragnad.
- II. In Halapura This rillage hadly wants a clausel from it a sillage site to the Dhadlar—a distance of less than a mile—to ease its crops from sleet trection during a year of even cidinary rainfall.
- III. In Kace or i Val A channel is reversely all along the modifiers Val to Kara- of about 3 miles in length. This would be useful to the surstruction fulls; it will discharge itself in the Array, constitutional, near the sillage of Kara.
- IV. In Stranger, Small changes are consisty in the form of the a lispeach School is necessary in practice from the Aller in the all confidents for the Atompostical Confidents Smith.

Mr. Gopalji. For the last half a dozen years, the rainfall has been comparatively light in the taluka, and hence there is not 11 Dec. 01. at present a great ory for channels, but the nbows-mentioned ones would be assful. The majority of the people want thom.

Those channels would not be very expensive and their cost should be met with from the local funds, where they are useful from a sanitary point of view; and from Provincial grant, where they constitute useful improvements. They are likely, in my opiaion, to result in an increase of rovenue, as also to ensure prompt payment of revenue and to lessen the burden of the cultivator, who would be easily able to pay his assessment, when he will be saved from injury to his land from water-logging.

There is a complaint in some of the villages of the taluka that the drainage channels aweep away the fertila amface soil and leave an inferior one in many places, full of "Maradias" or little white gravels, of which lime can be made, and I have reason to bolisve that their complaint is partly correct. Fields which formerly grew "dangar" and "jnar" or wheat are now not fit for anything but cotton. Formerly the water collected in the low-lying lands and it was used to irrigate the drying fields of "dangar" when the rain hold off or ceased or was not sufficient. Again, the grass and other natural growth remaining under water decomposed and served the purpose of manure; "juar" was sown in the fields when they became sufficiently dry, and those that were not dry by that time were later on sown with wheat or gram. Instead of all this, now the water at once flows away by the channels; the result is that the fields adjoining the channels are in several portions washed away and cut up and they become often unfit for anything; the others also suffer more or less. Grass and other useless plants grow apace, and weeding costs a good deal. Besides the time for sowing comes at the same time in all these lands and it is short, and hence the people do not get that long time for sowing as they formerly did, when there were no such channels. Formerly they sowed the light brown soil in this beginning of the monoon with bajri, kedra, cotton, etc., or the black soil, in which water did not accumulate, with cotton, etc., and when they were free from that they took these black soil fields in hand where the "varop" was late on account of the accumulation of rain water; whereas now the "varap" comes on at the same time on in the other fields, and hence there is less time available for sowing.

The people say, they gained a good deal for a few years after the channels were dug; but now they say they are losers. "Dangar" crop has been reduced to almost ail in those villages and its place as well as that of 'jnar' and wheat, has been taken by cotton. which, however, does not now turn out successful on account of the irregularity or insufficiency of the rains, and which is not so paying as formerly owing to the reduction in price.

During the last famine year I was told by some people of Jantran that their channels should be filled up, so that they might serve as famine relief works and might also do good to them. The complaint is very strong in this village, because the rice-erop which formerly grew in abundance here has disappeared a few years since, partly because the rains are not heavy, but chiefly because there has been too much draining off of the useful mouseon water. In the rest of the villages, there is either no complaint, or what complaint there is would disappear with a heavy rainfall.

Such channels prove more useful in light soil than in black, for if the water is not drained off in black soil, the land can be sown with later crops such as juari or with wheat and gram, etc., when the water dries up; but in the case of light soil fields, if the water is not drained off, the time for sowing bajri, kedra and cotten passee away, and when the "varap" takes place, the time for sowing is over; the light soil coes not grow rabi crops, each as wheat, etc.

It may be mentioned that these channels are merely drainage channels constructed to carry away moreon water, and they are not irrigation cauals. No water is drawn from thom for irrigation, and they contain no water after the close of the monsoon. Some of these channels, on being repaired and provided with wasto woirs, can be at a little cost transformed into large lukes for storing water, but I do not think they will thoroby serve any useful purpose. An experiment may, however, be made with part of the Jantram-Madafar branch channel, about which there is a great complaint and which may prove of some use.

Paragraph IX.—The following tanks were excavated as famino relief works during the last famino. They are all

large tanke useful for miscellaneous purposes to the people, but not used for irrigation.

				Re.
1. Dabha		•		1,12,000
2. Tankari			•	1,44,000
3. Shigam				1,21,000
4. Jambusar	٠.	• ′		94,000
5. Karli -	•	•		41,000
6. Kalak				11,000
7. Dolia				6,000
8. Pisad				8.000

Tank No. 7 has decidedly improved. As regards the rest it appears their beds have not been "formed"; for though they are deep, they do not hold water as well as some of the shallow tanks are known to be doing. None of the beds are, however, perons to a great extent, and a little citting will, it is supposed, improve them. These tanks have undeutedly improved the water-supply of the villages; the four tanks of Dabha, Jambusar, Tankari and 90 A 70 A 72 A

Shigam are large reservoirs which will be useful in a year of 34 A

drought; but for greater usefulness and to serve their purposes in full, masonry waste-weirs should be provided for all of them excepting Jambusar, which has already got them. Shigam and Pishad taaks may be said to have gained nothing by the excavation; for the former, while it gets water by one way, loses it almost entirely by another—both the ways being in part the same; and the latter has no income of water, having probably lost it by the now Umm-Koteshwar channel. The big tanks of Dabha, Tankari and Shigam will, I hope, in the long run, be utilized for irrigational purposes also, if they are furnished with wasteweirs and maintained properly, for they will then contain an abundance of water much more than would be required for all other possible wants of the residents of the villages.

I am of opinion that the big ravines of river Mahi to the north of this taluka in the limits of the villages of Vedach, Piludra and Kareli can, at a comparative little cost, be converted into vast lakes and be utilized to irrigate the extensive "Bhatha" or alluvial lands below, in which Babul trees floorish and which can be reclaimed without much difficulty.

#### 11.

- 1. My answers refer to the Jambusar Taluka in the Breach District. I have been Mamlatdar of this taluka for the last three years.
- 2. The average rainfall is as follows in each month of the year, the average being of the last 10 years:-

Name of	mont	b.			Rain	fall.
					lnohes	Cents
Japuary	•	•	•		0	1
Fobruary			•	•	0	11
March .			•		0	1월

October		•	•		1	52
November			•		0	28
December		•	•	•	0	1
					34	441
					-	

3. The following are the obstacles to the extension of irrigation in the taluks:—

#### (a) Sparsity of population-

The taluka has an area of 3862 square miles. The population is, according to the last consus, 61,846 senls. Thus it comes to 160 to a square mile; a large portion out of this is comprised of non-agriculturists, i.e., tradesmen and labourers. In the villages of Kanwa, Kareli, Filulta, Vedach and Gajera, where there is something of irrigation, the population is four times the average of the taluka, being 640 per equare mile, and it consists almost entirely of agriculturists.

(1) The unwital lidy of the black eatten wit to imiga-

The greater part of the land of the taluka le Nack coren wil. There are lotally 57 villages, of which 22 are "Barn" or reaccost villages with extircly blad will get villages with extircly blad will aril (see-served ROJON), and 46 see "Non-Barn" villages, the greater post in of the land of which is there exiten you being seel, fasterement 112.02.420), and 19 villages only with hight from each insertment RILEAN). This the greater portion of the blade and financed of

(c) Lail of expital for the initial expenditure and of funds for the more expensive cultivation of irrirated stops-

The initial expenditure would be-

R foo fer a well.

. 137 for a pair of bullocks.

23 for Koe-Varni, etc.

R (75

The seeds cost a good deal for come of the liriga-ticual errys; the piriog of a "Kos" c. ets maily one rupe a day. Most of the people are too port to incur this expenditure.

(d) There are other reasons also; for example,

- There are other reasons also; for example,

  1. The librarian tenute, under which each Klatedar
  helds large holdings; he cultivates the test
  lands of the librar himself and rents out the
  rest. The tenants, even if they have the means
  which they generally never have, do not dig a
  well or make other improvements in their
  land, for they are annual tenants, and if they
  make any improvement, their rent is enhanced
  or their leave is cancelled. Out of 65 villages
  in the taluka, excluding the ham ones, there
  are 55 such Blagidari villages.

  11 Inether village also the holdings are large and
- are 55 such Diagidari villages.

  11. Inother villages also, the heldings are large, and so the occupants do not find it necessary to labour hard to maintain themselves, and they do not therefore take to irrigation. They raiso enten crops which do not intail much labour and which yield agreed uniturn. An acree of first class exiten land yields more than 18 in aunds of and-cotton, which means nearly 75 injects. Why should the cultivator than tell for an irrigational crop which involves more trouble and more expenditure and is more trouble and more expenditure and is net likely to pay more?
- III. Again 43 per cent, out of the total occupied area of the talula is Inam lend, and the expression of like to exert themselves laving culy a small amount to pay to Government in the case of these lands also, the great per-tion is in possession of annual tenants who would not make improvements there a.
- IV. The greater portion of the cultivating classes are Kolls, Hajputs and Bollorss, who are not four of imignies.
- V. Sweet water is rare in the greater part of the talula, which is great obstacle to irrigati. a.
- VI. Lastly, the ini-chierousness and lariness of the lower classes—agriculturists as well as others—who steal and injure the asluable irriprtional cusps: this lesps back a good deal of irripation in Jamhusan town for example, where there are minorious sources of mater estable of irrigation.

i Under the Sarrey Settlement, rubanced assessment is leafed and land, millibare injuried from any source of water, whether a well, a task or a water-cure, etc. In case, where this source of water use it led upon as a present one, and appeared to lave been used, the Survey is partnered und discrepanced to late the under the partners in additional assessment proper, and it is forned to a case in which a mely for which such assessment was lasted, were not of regain, and get the enhancement was lasted, west out of regain, and get the enhancement was a terminol, and of pumenous cas a of tanks, etc. where thought we assess measter for impation, the enhancement was certified to be taken. I also know of a few some wines and enhancement was certificable in any time where the first well as the water of a few some wines and enhancement was a certificable in any time was not distinguished as the water of a few some and materials, wells, takes, etc., which were not a core of materials, wells, takes, etc., which were not 1 Under the Sarrey Bettlement, enbanned arecement by

su assered for, were to be elargel for at the rate of 8 Me fin, ela rupce per "Kes" whenever their mater was med, if they were in Government land. A "Kes" generally unique. It Desert, alors were released, that is to say, the full "Kes" rate was not levied, but a core or less partial rate only, particularly in years of sensity rainfall, when even release was levied in some instance.

To ante do not in any case extend traigation at their can ect to the lands in their travers. for their terrory is annual. In one villege coly, there are a few permanent terants, but they do not make an heightenesses, for they are affined of their landleds, and there is resum indeed that they should, for even a sub-distret of one of these landleds who constructed a well in one of the fields in his Ist dienla who constructed a well in one of the Felds in his share—it gunthas assessed at 110-12 0—1 as been force to per Hit to his principal, on account of the existence of the nell. I do not think that the existing provisions in this respect are sufficiently liberal, but it is expected, they would be after the review Survey, when oll such sufficient month will be removed and only further by a general sufficient whose though I do not understand on what prively be and evidence the aub-cil capacity of the land will be determined. The system of sub-neigh rates for brightin adopted at the original Survey did mischief, in my opinion, by deterring people from digging more wells.

As regards lacicla wells made in Covernment land after the original Survey, special rate was levich for their use in the same war as in the case of tanks, sirers and water courses, but that practice was stopped under Gorenment Residution No.588, dated 18th duty 1884, liercune Department.

The Commissioner, Northern Dirlsion, under his Gujarali Circular No. 6, dated the 15th July 1885, hand in-structions to the Collectors to the following effects:-

Certain wells being out of order and useless, no per-Certain wells being out of order and useless, no per-manent rate was charged on their account at the eriginal Survey, but when such wells use exel-fer irrigational uniposes, special rate was charged at list per "Kee"; but it must be remembered that before such nells are made useful for irriga-tional purposes, they would cest same frontle and expense to the cultivators, and hence no-thing should be charged for their use in future. This order is also being followed.

This order is also being followed.

6. Leans under the Land Improvement Act are not friely taken by the people for the extension of irrigation. The reasons are partly the same as are mentioned in paragraph 3 sgainst the extension of irrigation. Irrigation is not required by people in some cases, while it is not profile in other easer. The people therefore do not accept a han to extend irrigation. Again a cultivator does not like to henry acids and bullocks are to buy a neighbouristicle, as also to buy seeds and bullocks are to buy a neighbouristicle, as also to buy a neighbouristicle, as also to buy a neighbouristicle, as also to buy a neighbouristicle, as also to buy a how a bullocks are to give easts dimars, etc., but he would not, in the majority of cases, henry delt to construct a well; it is beyond his an iteratading to do so. Bestits, he does not like to be a deluter to Concentration who will brook no delay in payment and also would receive it in m hom summarily—ejecting him on his lamily from his learth and field and selling him up, so to say the would prefer any creditor; by the remain to you to say the would prefer any creditor; by the remain to you are a solly, while he wants it oftense for doesetic purposes; and if he made a wants it oftense for doesetic purposes; and if he wants are the "Sarkar" and stude in the wants it oftense for doesetic purposes; and if he was remained in least for more than from the returned as a present of inferior mentional his bank returned as prison of inferior mentional his heart from the first mental and the product of the financial difficulties, and they must delt in a way unknown to others; eachiers likewise keep such transactions unknown to others; eachiers likewise keep such transactions with a work from thouse for the far is a first in any thin and thing on artificial difficulties are known by sile. The majority of if query for a great man thing on artificial difficulties are known through, not in a safety for a series of their ball of a soft lie of the same transac 5. Leans under the Land Improvement Act are not freely

I All frame to be well and a meteral

Mr. Gopalji-11 Dec. 01.

- 2. Small leans to be given in the first instance to make trial borings: not more than half of the leans to be recovered if the trial fails and in reasonable instalments, not to exceed in any year one-oighth of the amount poid by the grantee as land reveaue to Government.
- 3. If the trial is successful, a farther large loan to be granted and to be recovered in reasonable instelments—the amount of the instalment net to expeed in any year one-foorth the amount paid by the grantee as land revenue to Government: if there is a failure to obtain sweet water, not more than half the grant to be remitted.
- 6. I do not think that in this talake, the extension of irrigation will tend to injure the remaining oultivation by attracting its cultivators to the irrigated tracts.

There is a desire evinced by the owners of rice-plot lands to have means of irrigation extended to their lands.

#### Tanks

Paragraphs 23 to 33.—There are numerous small pends throughout the taluka, the waters of which are supposed to be useful to the adjoining fields for irrigational parposes, and on account of which those fields have been paying a somewhat higher assessment: but account of them are netually used for the purpose, for they berdly centain sufficient water. These pends are eld ones and are now silted up and no monoy is spent on them either by Gevernment or by any one else. Besides, I do not think, these tenks were at any time systematically aced for irrigation: they were occasionally used when the later rains fell short for the "dangar" orops. There is only one tank in the talaka, namely, that of Survey No. 14 of Jantran, 3 acres and 19 ganthas, which once used to irrigate the surrounding rice "Kiardas"—8 acres and 3 gunthas in extent, assessed at R71-12-0 out of which R4-8-1 represent the "Himayat," but this tank is now not so used, because it has silted up and is out of order and on account of other reasons also.

The following are the details of lands that are pretected by tonks and cimilar sources of water according to the Sorvey Department, who at the original Survey ordered the levy of permanent special assessment on their account, the said assessment being consolidated with the land tax-

2	Total Survey Numbers.	A. O.	Himsyst or special nerces. ment.
			R. o. f.
Tanks	. 1,133	2,252 13	1,112 11 0
"Voho" or water-courses "Kaos" or drainage-c	. 45	69 23	35 1 7
nels	. C	8 2G	4 13 8
Khad or hollows	. 60	159 50	71 7 8
"Marg" or road land	riog	78 3	33 14 5
grazing lands	· · · · · · · · ·	1 11	0 13 0
Total	1,317	2,669 35	1,583 1 7

Whenever there is any water in these so-called sources of water-sapply, and it is needed for irrigation, it is raised by artificial means by human agency and then carried by a drain to the fields.

#### Wells

- 34. (1) The average depth of permanent wells is about 50 feet in black soil villages and about 60 in the rest.
- (2) In wells of this depth the water-supply is from spings and is not liable to fail even in a year of drought, though in the sea-coast villages it becomes, in some cases, more or less saline in such a year. In these latter villages I have seen a step well which neither ran short nor in the least hrakish in the famine year, when all the wells around it within a distance of five miles were affected.
- (3) The average cost of constructing such a well is about R800.
- (4) A well of the sort described above losts for a century and more, if ordinary repairs be executed occasionally, such as the catting of young trees growing on its sides, the filling in of bird-hules in the walls, and the repairing of ordinary injuries to the mesenry.
- (5) The water is always raised by means of a "Kos" which is drawn by a pair of bullocks.
- (6) The average area attached to a well and commanded by it is 8 acres.
- (7) The average area annually irrigated by wells is 150 acres.

The largest and hest well in the taluka, is in the villege of Novar, four miles from Jambusar and about the sams distance on the south of the river Mahi. It is at less a century old, and is situated at one end of the villege tank. Is is about 50 feet deep and is abeat 20 feet in water. It has a diemeter of 26 feet, and 12 "Kos" can ply under it, more than 20 acres of land are commanded by the well, and they pay a total water rate of 55 rapees a year to Government. But only about 5 acres of land are annually irrigated out of the 20, and not more. It is, a well to which, hy way of an experiment, a small steam pamp may he attached for the purpose of irrigating the surrounding lands. The well perhaps shows that artisian wolls are not impossible in these parts. The well is going out of repeirs from the top, and no one cares to repair it. In the Government records it is noted as a "Sarkari" or Gevernment well.

- 85. Irrigation increases the value of the produce or land-
  - (1) by one and a half, giving a net profit of about R45, by rendering it possible to cultivate two harvests instead of one.
  - (2) by two-fold, by leading to the substitution of more for less valuable crops or varieties;
  - (3) by about two-fold in a-
    - (a) year of nmpls rainfall;
    - (h) by about the same in a year of scanty rainfall;
    - (c) by nothing in a year of drought, for the cost is very heavy and the yield is basely eneagh to maintain the cultivator and his cattle.
- 36. The total annual value of the prodoce per acre of land due to irrigation is-
  - (i) about 45 ropers on the average of a normal term of years; and
  - (2) about nothing in a year of drought.
- 37. The average annual rate per acre paid on account of irrigation by the cultivator to the owner in the shape of enhancement of rent is 10 ropees, and by the ewner to Gevernment is 3 rupees.

Government charge the rate on all lands which are commanded by the well according to the view of the Survey Department, whether they are irrigated or not.

The owner charges the rate on all lands which the cultivator takes up with intent to irrigate.

38. Serious difficulties are often encountered, both in the selection of n site in which a supply of water will be obtained and in the cetual construction of the well.

The oultivator selects the site of a well either with the help of a Brahmin or some such ether persea who is a "Joshi"—an astrologer — or is versed in the popular estimate in the science of the selection of successful sites for wells, or with the help of relations and friends who here built wells er sess wells built. In the former case he takes the man's word and begins digging, and if there is a slight indication of his word proving troo, e.g., the appearance of water at the stated depth, no matter brackish, he goes on hopefully. In the latter case, he and his friezeds select a site which is usually any piece of low level ground in the field, where water accumulates in the measoen or which is near or in the direction of a successful well thereaboat, or which is near a tree of a particular kind, such as the Jambuda, the Sanada, the Vad, the Mahuda and the Umra or which is near by a hush plant of particular kinds, such as the Kamei and the Chini-Bordi Nene of these methods is hewever reliable, for numerons wells on sites approved under these systems here turned out failures during the famine year.

In diggiag a well, percelation water generally appears at a depth of about 15 feet; the sides of the being through which the water perceletes are all moist and they become more meist an account of eareless taking out of the mad and water from the bottom. On this account the earth from the sides begins to slide in unless it is hard; in some cases the earth being of a loose sandy moold, it falls in of its own accord in large blocks or in henps of sand, and injures the workmen below and readers the work impossible or at the best a costly and ill-success. To prevent this result, the caltivator reserts to the construction of what is called the "Toendi". In the first place a circular ring of "Samda" wood, called a Chakkar, of the circumforcace of the well is got prepared by a carpenter; it is about a foct or mere in thickness, and nearly two feet in breadth; on this is meuated black-earth and brick work, and when the

whole read es a height of along 12 feet, it is I were I down whose tractors a longist to me it as two it is a more to me in the election belt, at by the shifted weakness who are called "Coalars" and are lightly post for their work. Further dipolic is done and the "Toonti" is lowered. This prevents feither falling in of the earth from the sides, but irrepases the cost of the work.

but increases the cost of the work.

When probability water appears, the cultivator becomes hypital. It the mater is trackin, he thinks it to only term taking water and kepes that it would improve farifier down. So he proved dispiner; then he constructs the "Tourdi", and the work thus taken in land seriously is provided with seen if the waters do not improve, it ough it is abandored before it is fully carried out. I know of a term case, in which wills have been abandored in this way. I know of two cases only in which the ewhere contract in a light the work had to be abandored from the hypothesis abandor to the falling in of heaps of sould from the riles.

I do not know of forcement or a Local B dy ever

I do not know of Generoment en a Local B dy ever effection as frame in the skap of expert advice or trial britism or the was of terms took. Such advice would of our rashe result if of a reliable value and on this given in the skap of trulterings and the wee at leving tools.

During the last faulty several people used a botton of portus called a "Shar la" to improve their wills, but it governly met with an identeess, instrument as though it troughtent a engines supply, rendered it too saline to use.

- Only one well was proceed they being thes level; it was More, and of hardish and it improved and horano anest on being level.
  Only the other day I med the tool in a Level Fund well II the seq with second the notifies a few full min a copies supply of potable nature. I also improved another Level Fund well in the same way two years ago.
- 52. I am not in the farcar of construction by Greens ago-ries to wells in land which is private property. In the fast place the well might form on the he a failure Secondic, it will east to the removed result double of this it would be a private landscener. Thirdly, the landscener would decline to use it permanufly the relations it one year and not use it the rest. So the well will not pay. Frankly, it might contenance again to district in the mind of the landscener that Government would increase his land-tax at the next settlement, if he used its water. tax at the next refficient, if I e well its mater.
- An experiment in the direction will not lowerer to thrown away in a village like thiers where the population is of Patadars and is thick and insustricus and skillful.
- All Telaporary wells are very rurely used in the telelat. If they are in a sell where the siles do not fall in they are a very good protection against drought. I have seen only three such successful velle, one of which has been in castemen there three years and is not for irrigation; but such cases are rare. A liberal grant of trians will encourage the digging of wells of this sart, and if a necessary, the against the first property the contract of the sart, and if a necessary the against the construct of the sart, and if a necessary the against the construct of the sart, and if a necessary the against the construct of the sart, and if a necessary the sart sart is not sart to be successful. ful, the owners themselves will construct them patta tefere
- 1. Q. (The President.)—You are Mambalder of the Jamlusar talala ?—You
  - 2. Q. How long lare you been there!-Three years.
- 3. Q. Where were you before ?-I was in the Panch Mai als district for a short time. I was also in the Kaira Chiri...
- 4. Q Yes have be a in the Jamburas taluka during the families -Yes.
- 5. Q. Dil you lose many people!-Yes; we did.
- C Q. You have very little irripation in that talula f-Yen very little.
- 7. Q. What do you irrigate f-Bice and Activa.
- 5. Q. (Ur. Rletten.)-What is Leten ?- A small millet. We also trighte chilles, brinjals, and onious.
- O. Q. (The Presidents)—You say every village has got a tank's—Yes, for democile purposes,
- 10. Q. Not for irrigation f-No; they are ebledy for Emiet e partiere.
- 11. Q. You say, "there is no cultivation entirely dependent on allow (tanks)." It must be helped by rain?—Yes, it ravely requires I tip from irrigation.

  12. Q. All these tanks were dry in the famine time?—Yes (all these tanks were dry in the famine time?—Yes (all the entire).
- 13. Q. Did they prow any crop inside the bed of the table?—Yes, make with we'll nate?
- 14. Q. Young, "the obligations of Givernmentas a great landled to maintain in an efficient state there some edvatroupply for the use for which it charges rent, are manifest"? Dept. 12 understand that they have certain its literast to the upleup of tanks?—Some understand that they have efalit ; rome dint.
- 15 Q. Tiere is to power to compel them !- No; certainty not.
- IC. Q. You say," or far as I how, the Germment have not spent one money on these tanks in the telular. Second of the stands of the stands of the ministration of the ministration of the ministration of the ministration of the paper. Where do you demand that were taking places. Where do you demand that we receive, it, it a tank page discourage then then his 10, 16 de Die grantlem is to um it maintainen ft.
- 17. Q. Where do you draw the line at 18a Di-Yers that would be the figure.

- SS. Q. They did not vet any benefit from discounting the wells?—No, they generally not sait mater, though they not a to recept me supply.
  - 13. Q Test spoil-1 the welle?-Yes,
- 27. Q. You say 5) nells were alandoned eving to this? Yes
- 22. Q. In printing the many, that the people inflored is teach on a consist of the materiagning since the fact in large state of the materiagning to be going of the first printing that the could be being removed one are large it distanced and a
- for Q. You exprise a dishiful cplain about them had no expressed to the properties of regard to exception of the properties.

Mr. Gopalji.

- 40. Q. What do you meen by varap ?- Dryness of the soil; that is the mischief of the drains.
- 41. Q. You say the channels dry too fast ?—Yes. From almost every village there are complaints that the drains soon off the surface soil and do a lot of harm; also that the sowing time is now too short; formerly there were two classes of land—wet and dry; now all are dry, and have to he sown at the some time.
- 42. Q. Could not the droins be regulated by putting in sluices P-Yes; I think so.
- 48. Q. You say, "The people say, they cained a good deal for a few years after the channels were dry but now they say they are losers. How long is it since these draintoge channels were made?—Ten or 12 years. They were made in 1891-92 and in 1891-96 more lands were taken up for cultivation by means of these channels.
- 44 Q. Before drought came did the people begin to complain of these channels ?—Long before that.
- 45. Q. If the rains are heavy again those channels will be useful and the complaints will cease?—Yes; the complaint is really a serious one in only one village.
- 46. Q. How many villoges benefit by it?-About 12 or 15; we went more drains yet.
- 47. Q. (Mr. Muir-Mackenzie.)—Do you think, in spite of these compaints, it would be advisable to extend the number of drains?—Yes.
- 49. Q. (The President.)—You say "In my oninion the big navines of the river Mahi to the north of this taluka in the limits of the villages of Vedach, Pilnden, and Kareli can, at a comparatively little cost, be converted into vast lakes." Is that area in black cotton soil country?—No; it is alluvial soil but there is not a single acre macultivated in those villages. All the land is valuable, and what irrigation there is, is in those villages. At present the people pay at least Rs. 15 per ocre for unirrigated lands.
- 49. Q. The Mahi river goes down to the sen; where would you make your bunds?—About a mile from the high bank.
- 50. Q. How many acros do they irrigate now?—It would be a thousand acros.
- 51. Q. Are the people rich?—There is good olluvial fertile seil and a thick population; there is not a single weste ocre in the villages.
- 52. Q. You say in paragraph 4, "nader the survey settlo ment the onhanced ossessment" is levied on oll londs which are irrigoted from ony source. Do these peeple apply for remission if the source censes to exist?—No; only those who apply for remission get it.
- 53. Q. I understand that it is not the habit to upply for remission?—Yes. For some reason or other they do not apply; the tank assessment is so little that the people do not core to trouble about it or perhaps they don't know the rules. I know of some insteaces in which remissions have been granted and of one case in which it was not granted.
- 54. Q. You say looms ore not freely taken up by people for irrigation?—It is only the rich that make wells themselves; the poor do not inour dobts to make wells.
- 55. Q. Do you know of eases in other districts where grants are made for wells?—They are mode here in our telukn as well as elsowhere, but the people do not like to run into debt for moking wells in this part of the country where they are not fond of irrigotion.
- 56. Q. Have you served in any other district?—Yes; in Knira, where they incur dobts to moke wells.
- 57. Q. Yon soy, "in ordinary years the people look npon a person who necepts o Government loan as n man of inferior meons"—is that the case P—People do not like to toke leans.
- 58. Q. (Mr. Ibbetson.)—Loans from a bania would have the same effect?—They can take from banias secretly, nnknown to others.
- 59. Q. (Mr. Higham.)—If there is no ossessment on small tanks as you propose, do you think the people would clear them out?—I don't think they would, because there would be so many sharers in the tenk.
- 60. Q. They would have no reason to complain that Government did not do it?—When they come to know that it is to their benefit to keep their tunks in repair, some of the agriculturists might do it.
- 61. Q. Yon don't think they would do it ordinarily?—No, I dou't think so.

- 02. Q. What sort of repair do they require?—A little removal of silt, repairs to the bonk. Loth can be done of the same time.
- 63. Q. Is it done annually or every ten years?—Once every five years; sometimes every couple of years.
- 64. Q. You could not make them do it?—It would be rather difficult. In the cose of good rice lands, the people would do it of their own accord. I have seen one village in which they do it canually.
- 65. Q. The drains have led to cotton being substituted for nice?—Yes.
- 66. Q. Cotton is o more paying crop?—Yes, it is very profitable. People wanted the cheanels for the purpose of raising cotton. It has not paid for the last half a dozen years, os the rains are not sufficient. People complain that formerly they raised rice, junn, and wheat; but now the soil is not fit for these three crops. It is only fit for cotton.
- 67. Q. Yon say an acre of first class cotton lond yields more than 18 manads of seed cotton, which means nearly Rs 75. Why should a cultivator than toil with the irrigation of a crep which involves more trouble and more expense? I understand the cetten crop is a crop most suitable to this country?—Yes; cetten pays best in Broach.
- 68. Q. Why then is there an objection to the drains? Did they complain before the dry years come?—No, they did not.
- 69. Q. Before the dry years came they liked the drains?—Yea.
- 70. Q. And they still want more drains. You ore now making more drains?—Yes.
- 71. Q. (The President.)—I think you said that the land hegon to deteriorate before the famine year?—Yes; there was a complaint against some of the channels; not against oll the channels. The complaints are justified to seme extent, for in one place the soil has been washed only, particularly from the fields near the drains.
- 72. Q. You don't think complaints in other places are serious?—No, in other places they are not serious.
- 73. Q. Would not people be able to keep water on their fields by putting up little bunds ?—Yes, they would.
- 74. Q. They have not done that because it would cost much trouble; they want Government to do it?—Yes.
  - 75. Q. They won't help themselves ?-No; that is true.
- 76. Q. I suppose these wells which were constructed all over the district would not be worked in dry years?—They would not be worked in ordinary years.
  - 77. Q. Hove they cattle to work them ?-Yes.
- 78. Q. (Mr. Ibbeison)—What are tanks used to ir rigate moinly in Broach?—Simply rice.
- 79. Q If you made an irrigation took would the caltivator grow rice or catton?—He would grow rice, but first he would have to make kiaris.
- 80. Q. You have got a certain number of irrigation tooks already mode?—Yes, I hope they will moke kiaris under four of those made lost year.
- 81. Q. Does cotton pay better than rice?-Ordinarily rice pays better than cotton.
- 82. Q. I understood you to say that cotton paid better than rice?—What I meant to say was that excellent cotton lands pay well, but ordinarily vice pays better than cotton, especially when it is supported by irrigation and so mode more scenre.
- 83. Q. Yon say you don't think there is much hopo of the people mending those small tanks oven if the assessment was remitted P—No.
- 84. Q. Snppose Government made over the assessment to the Local Beards and gove them the water revenue to keep up the tanks, how would that work?—That would work well.
- 85. Q. Do, yea think they are capable of managing them?Yes, in the case of a very few tonks.
- BG. Q. Why very few ?—I think very fow of the tanks would pay the Local Boards to meintain them.
- 87. Q. If tooks could not be kept in order by the Local Boards how could the people keep them in order themselves P—They can supply the labour themselves and do the work more cheaply.
- 88. Q. Could not the Local Boards get the people to help them?-Yes, to some extent.

- 55 Q. They would be some likely to do it than the Public Works Department for Your some Likely to get the line smale
- po Q. (Me History)-World He Poblic Weeks Depatiment do it be the result means or it means of the secole!—By means of the people; ther would have to pay their sean people as well as other people.
- 21. Q. (Me. River s.t.-Would not the Local Read to able to make a small tank par where Government could not Fill a think Local Boards on M make it pay.
- 52. Q. About wells; you say it be prairie to a great extent to increase the number of wells; do you refer to the black out mould in only to allustial f—Chieff alluvial and likely cotton and where water in sweet.
- 93. Q Dagen get meet mater in block e ternsell F-Yes-13. Q. Have seen seen the people irrigating all surface ereps by means of wells in Broach in black cutton solic-Yes, I have, in villages in the west where the soil is pall a black cutton will.
- 25. Q. What sort of crops do they sow? Onions, ground-nuts and wheat,
  - 20. Q. Does that pay 1-Xes.
- 87. Q. Do they irrigate steadily every year?—No; they do an acre or two; people all a have tried it do it; ordinally they do one or two acres in every village.
- 98. Q. What is the proportion of alluvial soil to black cetter well?—About one-third light brown and alluvial.
  - 99. Q. That is one of allorial to two of cotton?-Yes.
- 169. Q. What interest does a colvent occupier pay to a lania if he lerrows money to make a well?—Not less than 9 per cent.
- 101. Q. We have been feld 0 per cent. I-No. 1 do not think that can be so. I shall not get it myself for less than 2 per cent.
- 102. Q I suppose the resson why people don't make more well she that in ordinary years unirrigated crops can be soon which you well?—Yes, they don't think it worth while to make wills.
- 103, Q. Your object in remitting interest is to make it worth while?-Yee, so that they may be useful in grans
- 104. Q. You would like Government to show more literality.—Yes eliberality should be shown in times of lamine.
- 103. Q. How many famines have there been in Broach in the last 100 3, and ?- Forlups one or two.
- 103, Q. How oft n would the people irritate in ten vor if Perlaps one year in ten. I most the people who have the lens its of ore gation irritate always.
- 107. Q. The ordinary potent, how often would be irrigate is Once in ten years; the well would rarely be used except in the 12 villages where they are necestaned to irrigation; and it would not be kept in repair.

- totrigation; and it would not be kept in repair.

  105. Q. Mont these draine; they complain of the receiving of the service sell in Free, and fields have been determed by service. I can it myself.

  110. Q. Have they done much a rices Larm f.—They let, denotoned here, but mechanice good than harm.

  110. Q. Me. References Midden)—He meets of embandonts of all you mit present the entiring up of the last limited to the entire to eath and that always errors outling; and greenly results in severing to the serface soil.
- 111. Q. By patring a small collaptement, the discage can be marked at first culture promoted for Year, that is le re dere
- 119. Q You say "think notion will se me favored before in extins?"—I at he capeap decreased by In the faults your me saw la. - applications are disputed of within Eltern or twenty days, Mr. 11. pr. 1 esen in one month sometimes. 11 150 61
  - 116. Q. You lave few applications ?- Yes.
- 117. Q. In pregraph 4 of your see all not a reason and the bound of a case in which a well for which such assument was leviel ment out of repairs and vel the one boucement was not remitted; does not the Tabelld's report and get the necessment relaced for I have not come it yet.
- It and report.
- 110. Q. The fact that the rayat has not applied for it does not present the Tabuillar from reporting on it and getting the assessment reduced F. Sometimes we look upon it in another may; we say it is his business to keep them in repair.
- 120. Q. (Mr. Nair-Nocleanie)-The number of Government wells is very small for the
- 121 Q. What is the assessment on land under Government wite the numb per Ker?—Yes; rupers 8 when it is not permanent; when it is permanent the average is from each name to lie. B per acre.
- 122. Q. De you mean to say that if them are Government wells and a man does not get water he does not complain?—Really the people look upon all wells as their own property. Even wells in Government lands are supposed by the people to belong to them. The rayat will not allow us to repur the wells. They say, "the well is onro," I know of several such cases occurring in the famine year. I went to repair them and the people said "no." Our records show that they are Government wells while they say that the wells are theirs.
- 123. Q. They do not require grants from Government?
  -They have had grants in some cases
- 121. Q. In term " registion revenue " you don't include the extra amount of assessment that is levied on land which is under small tanks?—No, that is always excluded from the figures for " irrigation."
- 125. Q On what grounds do you believe that the enhanced accessment (on a count of prigation) is going to be discussioned at the time of the Revision Survey?—I understand that a general subscoil rate is going to be sulstituted.
- 120. Q You ray that the people are charged kirryat rates even when there is no water in the tanks Yes.
  - 127. Q. Have they made to complaint !- No.
- 128. Q. What is the resson of that f-The charge is sa small that they hardly were; it is a very nominal charge of Iwo to six unnes per nere.
- 120. Q. That is for sub-soil water !- No: it is a tank rate; the best small tank in Jamburar irripater 8 a res ?! sunfare; the total assessment was Rs. 71-12-0, out of which Ra 4 3-1 represented the water charge.
- Mr. Muir-Maclenzie.-The newsment on tank irrigation is very triking.
- 190. Q. (Mr. Rojaratna Mille.)-What is the total assessment on that land?-Rs. 5.
- 131. Q That is land accoment F-Yea; it includes the O.S. on account of the tank water.
- 132. Q. If the tanks were entirely dry, the dry assessment would also be remitted?—Suspension of revenue vould be granted.
- 133. Q (Me. Muis-Muclerate) Von any an ordinary velicous lie seri in black outen soil? -1 have taken the experience a known soil well.
- 184. Q. I want to know the c st of a well in black soil? At would be rearly 110, 700,
- 125 Q. Less in their seel than in braun sell b- Yes; tennes the depth would be less
- lid Q. The depth is less in block cotton sold f-Yes, at the feet we are such get copious mater.
  - 157. Q. You are not onto whether it is awest !- No.
- I'm Q Sometir search good and get a copious sopply of learnest water imalies.
- I.A. Q. Was any attempts also within your local-type tale will forther art to beyond epolic policing wase, water after meeting trackles by the first despirit of -Ver, but it is harrent when some a total it is harrent when he can be a time to the contract of the contract with the first section of the contract with the first section of the contract with the contract when the contract with the contract when the contract with the contract with the contract when the contract with fatheriers 1
- \$40. Q. Have je . seen grang of these dealers Affice ti ::

- 142. Q. Not so much to the higher P.—No; some higher villages complain that there is a defect in the channel, which does not carry owey the water quickly enough.
- 143. Q. There is no question about the upper villages liking the channels?—No; although some injury may be caused to individual fields, there is no doubt that the people have seen many of these channels now and believe that they are effectual in clearing water-logged lands. Some of them out branches to them.
- 144. Q. (The President.)—Is there salt in the water-logged villages ?—No.
- 145. Q. Have you ever seen the soil washed away by droios ?-No.
- 146. Q. Are the water coarses in which these drains fall safficiently deep or do they require to be deepened ?—They are sufficiently deep.
- 117. Q. Would you advocate an increase in the number of tanks?-No; io the number of wells; bat small tanks may be made.
- 118. Q You would not build new tanks P—No, not except those I recommended in the ravines of the Mahi. There a new tank may be made with the object of electing additional agricultural land.
  - 149. Q. Irrigating Bhatba land ?-Yes.
- 150. Q. In black soil you don't advocate may new tanks?
- 151. Q. You admit that rice is a safer erop than cotton F-Yes; with small inigating tanks.

- 152. Q. Why would you not advocate the extension of tanks in the black soil country?—The people knew about these, things and they have already made all the tanks possible.
- 153. Q. They have taken up all the available sites? Yes.
- 154. Q. You say, "where the chances of getting sweet water are surer than in other villages and where the population is thick." Do you think that the large population is entirely the effect of irrigation being there?—No, the irrigation is due to the population and to the superior soil.
- 155. Q. What soil is that P-It is brown soil-gorat-and good sandy soil.
  - 156. Q. It adjoins Kaira ?-Yes.
- 157. Q. Could the people not be induced to repair their own tanks !-It is difficult; it depends upon the Patel and Revenue officers and Agewons.
- 158. Q. (Mr. Muir-Mackenzie.)—Do you think the Revenue officers take a personal interest in the matter?

   Yes, as regards the village and water-supply tanks; but it is difficult for the Revenue officers to attend to all these irrigation tanks. There is not one irrigation tank to each willage, but account in each willage. village, but ceveral in each village.
- 159. Q. If they could at tend to it, it could be done?-
- 160. Q. Have you never managed to do it in the ease of a single tank P-I have managed it in one village.
- 161. Q. If you had time you might have got it deae in another village?—Yes.

WITNES No. 89 .- MR. STED SHAMSCODIN KADEL, District Deputy Collector, Sumt. I .- Answers to printed questions.

#### A .- General.

Mr. Kadri. 1. Tno District. 1. The answers refer to the Olpad Division in the Surat

11 Dec. 01.

I am District Depaty Collector in clarge, Olpad Division (consisting of Olpad, liardoli and Mundri talaka-).

2. The average rainfall in the divisian during the years preceding the famlue of 1899 is as under :-

Rant.	
Middle of Angust to middle of October.	Middle of October to end of December.
Inches.	Inches.
11	1:57
	Middle of August to middle of Getober.

3. (1) In Mandyi and Valese, there is a great obstacle to the extension of irrigation arising from the spareity of Kaliparaj population.

Not so in Bardoli and Olgad.

- (2) The Koliparaj have not got strong hullocks for irrigation. Some Ujliparaj have got sufficient eattle suited to the enlitivation of irrigated land.
- (3) The eastern villages of the Olpad talaka have not got sufficient supply of manuro.
- (4) In some parts black cotton coil is unsuitable for irrigation, but not co everywhere.
- (5) Uncertainty of the supply of water is an obstacle.
- (6) Lack of capital for the initial expenditure and of funds for the more expensive caltivation of irrigated crops is no doubt a drawbeck. The leather has and leather rupe for drawing water cost at the outset about Rs 20 and hardly last more than a year. The maintenance of strong bullicks and servants increases the cost of irrigation.
- (7) There is no fear of enhanced teat or revenue metssment as the revision survey rates are guaranteed for 30 3 enrs.
  - (8) There is no uncertainty of tenure.
  - (9) No other reasons.

4. The land irrigated from works constructed by private capital is exempted from enhancement of assessment on account of irrigation until the introduction of the revision curvey. The exemption is secured to practice as nothing

The exemption from enhancement of rent is extended to tenants if the lease be a long one, but generally tenants do nut care to spend much money in improving the land which does not belong to them. No alteration of the existing provisions of law is necessary.

- 5. Leans under the Land Improvement Act are taken by those Ujliparni Khntedars for the extension of irrigation by me ins of pakka wells who have got land suitable for irri-
- (1) The rate of 5 per cent, interest is not high compared with the exorbitant rate of companid interest charged by the money-leader, but a reduction to 3 per cent., if possible, would certually be a great encouragement.
  - (2) Remission of interest is not necessary.
- (3) I am not in favour of the partial remission of the advance.
- (4) Partial remission may be granted in case of failure of the attempt to obtain water, but such cases would be rare. No well is built pakka until the cultivator is sure of a sufficient supply of such t water. He incurs only tha loss of digging a karloha well at first, and the omeant may fairly be remitted in case of a failure.
- (6) The period of repayments is sufficiently liberal under se rules. This is no grievance.
- 6. As the area to be irrigated is generally small and is undertaken only by agriculturists of mems, the extension of irrigation does not injure the other cultivation. In some parts of the Bardeli taluks, people would be glad to have the means of irrigation increased.

#### B .- Canals of continuous flow.

### C .- Canala of intermittent flore.

There are no such canals in this district, and I have no experieurs of such canals.

#### D .- Tanks.

23. (1) The tracks in the Olpad Division are supplied with min water from the outskirts of the village and the area commanding the tank.

- (2) The water is distribated upon the land by means of an ordinary hand-made lift and small drain pessing through the field.
- (3) The sapply depends upon the capacity of the tank and the area to be irrigated. If the tank be full of water, the supply lasts till December, but if the area of the rice land be large, it rans short earlier.
  - (a) In a year of numble rainfall the supply would last till April.
  - (b) In a year of county rainfall the emply would last till September or thereabout.
  - (c) In a year of drought, the supply is insignificant.
- 24. (a) In the year of ample minfell irrigation increases the produce of the land three times by rendering it possible to cultivate two harvests and by increasing the yield.
- (b) In a year of scanty rainfall the yield would be nearly double.
- (c) In a year of drought the yield would be one time.
- 25. (1) By commencing the irrigation too late the crope either wither or do not grow vigorously.
  - (2) By too early cessation of the supply the Jield is poor.
- 26. When the water in the tank runs short, if the agriculturist has a well available, he irrigates the land by means of the woll to save the dying crops. These cases are rare.
- 27. (1) An approximate estimate of the increase in the total annual value of the produce per acro on an average of normal years would be Re. 50.
- (2) In a year of drought the yield would be about balf of the normal year's.
- 28. Omitted
- 29. It costs about Rs. 5 per acre to bring the water to the field and prepare the land for irrigation.

One that cultivates the land, whoever he may be, has to incur the expense. The tenant has no security for recoupment. It is not the quactice.

- 30. The Public Works Department looks after the irrigation tanks. The system of clearing allt and repairing the tanks does not work well, and it is highly desirable to have systematic arrangements made for repairing and excavating irrigation tanks at least in the course of tea years.
  - 31. There are no tanks constructed by private persons.
- 32. If the laud be supplied to people free of charge and exempted from assessment, soveral persone who have got land suitable for irrigation, would combine together and construct at an k by means of a takavi lose given on their joint scenarity.
- 33, inconvenience is experienced by the holders of rice tand in particular when the tank is silted up. This difficulty is keenly felt in the rice tracts of the Olpad taluka, where, for several years, people fuil to get rice for want of holp from the irrigation tanks. If these tanks were properly executated, they would have supplied some water at least even in a year of scanty rainfall, and there would have been some outturn of rice.

#### . E .- Wells.

Mr. Kadri.

34. (1) The average depth of wells in the Mandvi talaka is about 50 feet, it is about 35 feet in Bardeli and 11 Dec. 01.

- (2) The enpply is generally from springs and from percolation only in rare cases. The sapply from springs runs short in a year of drought and that from percolation fails. The water becomes brackish and comotimes too saline if un effort is made to deepen wells in the Olpad taluka.
- (8) The average cost of constructing a pakka well is about Rs. 400.
- (4) The average duration of n well is 40 years if kept in repairs. There are some large old wells of about 100 years standing.
- (5) Water is usually raised from n well by meane of "kos and varet" (leather bag and rope).
- (6) The average area attached to and commenced by n well depends upon the diameter of a well. A well of a maximum diameter is capable of 4 kes being drawn in the foar directions. From 6 acres to 25 acres can be commanded by a well.
- 35 and 36. The answere to these queetions are the same as in the case of quastions Nos 21 and 27, with this difference that the expenses of supplying water from a well are beavier than in the case of a tank.
- 37. (1) The enhanced rate paid per nore by the cultivator to the owner of land with irrigation facilities is nearly three times the assessment of the land.
- (2) The water-rate charged by Government is included in the assessment of the land. It is nearly as much as the rate for soil and ranges between Rs. 4 and Rs. 6 in the Olpad and Bardeli talukas and is paid on the total area,
- 38. (1) Serious difficulties are encountered in the Olpad taluka in the selection of a spot in which a supply of aweet water will be obtained because there is the danger of the water turning out salme.
- (2) In the Mandvi taluka and Valore Mahal, serious difficulties are encountered in the construction of welle, because the subsoil is story and stones have to be blusted. In some parts of the Olpad taluka the soil is "Chopda," and the well does not stand.

It would be an encouragement to the people if they are helped with expert advice and boring machines.

- 39. I am not in favour of constructing Government wells in private land, because the people would not like to pay the water-rate when they don't irrigate the land, and the income would not be worth the expense. At present if agriculturists use the water of a Government well by means of one "kos," they have to pay its, 12 for sweet water in the Olpad and Bardoli talukas and Its. 6 for brackieh water. In Moudvi the rates are Rs. 8 and 4 respectively.
- 40. Temperary wells are used by the Kells of the western coast villeges of the Olpad taluka to grow vegetables.

They afford some protection against drought. In a year of scanty reinfall takavi is freely giron for the construction of kachcha wells, and 162 such wells were constructed by the people with fukavi during the drought of 1800.

### Memorandum by Witness.

II

I am in charge of Olpad, Bardoli, and Mundvi talukas.
Olpad taluka is capable of being divided into three parts-

- 1. The Western Coast villages, the soil of which is mostly loose sandy which requires min in Septembor and till November for mixed erop. Sweet water can be found within a depth of from 10 to 15 feet, and the water-cupply is percolution. If a well be suak deep, the water is brackish. One-third of this taluka is impregnated with ealt.
- The central villages have brackish water underneath. Some of these villages have sweet water wells for drinking purposes.
- The water-logged villages are in the east. They fare well in point of crops when the rain is scanty and daring the famine of 1899 they were well off.

In the Olpad talaku, on the list of the Irrigation Department there are only 40 tunks which irrigate upwards of 20 acres, but in the whole taluka there are about 503 tanks,

١,

ewall and large, which irrigate less than 20 acres each. There are 127 pakka wells for irrigation and 986 wells for other purposes. It is possible to make new tanke in the west which is subject to tidel waters. In 1899, the people of Bhagya, fishermen, raised about Rs. 1,500 privately and unde n new tank. It would be advantageous to make everal such tanks on the coast. They would keep off tidal waters, reclaim sait land and loud to an increase in the ries land. Famine lubour own well be employed on such tanks. In this taluka there are 71,507 acres of unculturable land.

In the water-logged area, now tanks can be made and new rice land increased. Between Kudsad, Kareli, and Shiyan, thie experiment can be tried. For the Olpad taluka, I recommend firstly, the improvement of a large number of tanks already in existence, and secondly, romuke new tanks on the coast and in the water-logged area.

#### The Bardoli Taluka.

This taluka has already 698 wells for irrigation and 1,443 for other purposes. With the exception of the

11 Dec. Q1.

Valoro Mahal, this talnka did not suffer from famiae. Valoro Mahal, this talaka did not antier from famiae. There is a tendency to increase irrigated erops. In 1891 the irrigated erops were in 843 acres, while in 1910 the area rose to 1,286 acres. This taluka has 42 tanks for irrigation and 55 far ether purposes. This taluka is espahlo af irrigation; but the country is flat and a canal is ant possible. If people be helped gratis with expert advice and boring appaintus, there would be an increase in the area under irrigated crops. This taluka has about 20 per cent. of rice cultivation. ceat. of rice cultivation

#### The Mandvi Taluka.

This is mostly a billy tract and the bulk of the population is Kalipraj (aboriginal tribes.) This talnka suffered from famine in 1899, and the Kalipraj did not avail themselves fully of the relief work far from their population. This taluka has oaly nine tasks for irrigation and 23 for other purposes. It has only 24 wells for irrigation and 383 for other parposes. The rice land is utilized by the Kalipraj and the rice beds are more like small poads, from 3 to 6 feet in depth and unlike the ordinary rice heds elsowhere. It is possible ta find new sites for small and large tanks in the taluka. Nallahs can be bunded. This will afford enitable relief to the Kalipraj and increase the number of tanks and thereby lead to some increase in the rice land. Welfs have to be sank very deep and the stony soil below has to be blasted. Kalipraj can also be couployed in removing stones and weeds from their fells as ployed in removing stones and weeds from their fields as famine labourers and in making rice beds and bandharas on their land.

- 1. Q. (The President.)—You are District Deputy Collector of burst?—Yes.
- 2. Q. How long have you held that office ?- About 41
- 3. Q. Do yon know this district ?-I am familiar with the talnkas of Ulpad, Bardoli, and Mandvi.
  - 4. Q. How many talukas are there !- Eight.
- 5. Q. You saw the effects of famine?—Yes; in Maudvi the only talaka that suffered from famine.
- 6. Q. There had not been famino before for a very long time f-No, I believe not.
- 7. Q. What do you think is the best thing to do to make this district strong to resist a future famine?—The olr-cumstances of the different, talukas are different, for incumstances or the different tataks are difficult. As in-stance, Olpad has three parts; one, the western or Sea Coaet part, is very andy; the middle is practically impregnated with salt; and the eastern part is water-logged. In the eastern part I would increase the number of tanks and improve existing tanks.
- 8. Q. Are there a good many villages without tanks?— Yes, in the Olpad taluka I find there are small and large tanks, in all 503; the Irrigation Department has taken notice af oaly 40; there are 31 villages which have got above four tenks each; in some villages there are 22 large and small tanks, those is another village called Maadroi which has 18 tanks.
- 9. Q. The area irrigated is very small?— Most of them irrigate 10 acres and upwards, the Irrigation Department has taken aharge of tanks which irrigate more than 20 acres; tanks irrigating below that are not taken care ef.
- 10. Q. What would you do for the western part?—I would propose the improvement of the existing tanks; there is also a possibility of finding sites for new tanks. A few fishermen in the coast villages constructed a tank for which we simply gave them a small contribution. It cost in all about 18s. 2,000
- 11. Q. How many acres can be irrigated under such a tank?—That depends upon the capacity of the tank; at least double the area of the tank could be irrigated.
- 12. Q. What shout ether parte?—In the central part we find the water brackish; and the deeper you go the more selty it becomes. They have wells near the tasks which have drinkable water, but for irrigation purposes I think it is not suitable. Then in the eastern part there are waterlogged areas which faied best during the famine; during the year 1899 I found that the water-logged villages were the water represents in my talking. the most prosperous in my taluka.
- 13. Q Have you inspected any of the drains?-Yes, I saw one last year; it has been lately constructed; it does not run through mar soil-

Daring the last two years, about two lakes of rapecs have been epent in takari. Of this amount about half wao glven for the improvement of land. About Rs. 50,000 were given for pakka and lachcha wells. More than Rs. 10,000 might have been spent in making rice beds and landharas. With takari 133 pakka wells and 163 kachcha wells in the three tslukas under my charge. The Kalipraj have ordinarily to pay from 12 to 24 per cent. interest to the money-londer. The Ujlipraj pay from 6 to 12 per cent. Smell tanks in a large number of villages are to be preferred to a few large tanks.

Thu Amha Pardi Tank is likely to submerge about 756 acres, some of which is good land under cultivation. It is expected to inigate about 1,500 acres, but this is doubtful while the loss of culturable land under submersion is certain. while the less of culturable lend under sabmersica is certain. The Kalipraj are not very foad of irrigation, and they have their own pends where rice can be grown. The country is irregular with ridges and hillooks hardly fit for esnal irrigation. The people are poor and may not be able to pay extra water-rute. If the Teluka Beards get the irrigatian revenue of small taoks abandoned by the Fublic Works Department, and if they are helped by some further grant, they can more economically and advantageously improve these small tunks. There are 35 villages in the Olpad taluka which contain more than four tanks. Dihea alone contains so many as 22 amail tanks. The small tanks in the taluka which are good many badly require repairs. Their improvement would lead to an increase in the rice land. The terms for fakcei are liberal enough and those that require it take it without any enough and these that require it take it without any difficulty.

- 14. Q. Is it expected to do useful work?—Yos, so far as that village is concerned; but it was badly aligned and some of the lands have been scoured away.
- 15, Q. Is a good deal of rice grown on these lands?—No. These lands are capeble of producing rice, but in order to make rice beds we have to store up water; we have found places where we can store up water, and when we get a storage tank, a lot of the surrounding land can be converted
- 16. Q. Do you advocate an increase in the number of tanks?—Yo., small tanks; if we improved these small tanks which me at present mostly silted up, the people would be ready to increase the area of rice lands. They do not do so now because there are no possibilities of irrigation.
- 17. Q. Don't they prefer cotton to rice?—I don't think so. Rice is always a paying crop because you can grow two crops followed by wheat; hesides cotton is subject to certain diseases.
- 18. Q. What are the general fratures of the Bardol taluka?—The largest area is under rice. In 1891 they irrigated 843 acres, while in 1900 they irrigated 1,286 acres, that shows that people are fond of irrigation and that they would extead it if they land the means.
- 19. Q. This taluka possesses a gaod many wells?—Yos, 698 for irrigation and 1,400 for other purposes.
- 20. Q. As regards Mandvi its hilly tracts are mostly populated by aboriginal tribes?—Xes, they are not very fend of irrigation; the population is very sparse; on the hills irrigation is not practicable.
- hills irrigation is not practicable.

  21. Q. Would it not be practicable to find a site for a reservoir?—Yes; they have found one place at Amba Pardi, I saw it personally, I do not think there is any great chance of that achemo being successful; the greatest objection is that while it would irrigate perhaps 1,700 acres it would certainly submergo 756 acres of the best mable land; it is mostly khari, and the prospects of agriculture are doubtful. For the same cost I could get 200 tanks excavated which, taking an average of 16 acres, would cavily promote rice lands to the extent of 3,000 acres that would help three talking a finite. talukse of mine.
- 22. Q. Generally speaking you recommend tasks?—Vory strongly; small tasks; I would also recommend an increase in the number of wells.
- 23. Q. Is there a large increase going on just now?—No; during the famine year and last year I had about 296 wells added to my charge.
- 24. Q Mr. Ibbetson.)—Were they built pakka?—There were 133 pakka and 163 kacheha.
- 25. Q (The President.)—We have been told that the people do not like to borrow money?—That is a mistake I

noticed during the lost two furnises that they took takavi very rapidly for the improvement of their lands. They have made new rice lands and recently they have also grown grain.

26. Q. You think they availed themselves of takari freely?—Yes.

- 27. Q Dn you think any encouragement is necessary so that they may be induced to make still further improvements?—We have already had the orders of Government to show them leniency in the metter of the remission of ments P-
- 28. Q. De you think it would be a good thing for Government to lend money without interest for a certain time?

  —I do not think it would be a good thing, because when they go to the sewear, the sowear charges them from 12 to 24 per cent interest. I think the interest charged by Government is small enough. In certain cases if Government would grant remission the people would appreciate it.
- 29. Q. (Mr. Muir-Mackenzic.)-Remission during fa-ine f-Yes. mine ?-
- 30. Q. The President.)-You found that the people required no encouragement here?—I don't think so, they appreciate the grant and take advantage of it wherever it is possible. For the information of Mr. Muir-Mackenzie I may be permitted to say that between Kareli and Kudaad there is a tank where a reservoir and a small drain for water-logged areas could be built.
- 31. Q. In cortain places you think it is advantageous to have an extension of tanks?—Yes.
- 32. Q. The increase in the number of welle is going on without Government taking any netion in the matter?— Yes.
- 33. Q. You don't see ony necessity for pressing the people to make new wells?—I think they want special inducement, but I would let them have boring tools and the services of an expert; they are afraid of certain sites, because they are doubtful us to whother sweet water will be found.
- 31. Q. Supposing a man finds good water, would you make him pay naything f-No, I would give assistance free. I think it is better to increase the number of wells by giving them help
- 35. Q. You recommend that more money should be speat than bee been spent lutherto upon the systematic improvement of tanks ?—Yes, I am sorry to say that very little is speat for irrigation proposes. I would propose that in the Mandvi tulukn, where famine was bad and where we have gut a very small number of tanks, Government should let off interest; places can be found where new tanks can be made, and this would leed to an increase of rice lunds. Mandri has got only nice irrigation tonks and 28 other tanks; but there are facilities for increasing their number.
- 36. Q. You say the place should be surveyed and examined P-Yes. I have already found 12 places which, if approved of by the Public Works Department, are likely to be taken up.
- 37. Q. You think that the best work for famine labour is the improvement of these drolunge chemnels P—Yes.
- 38. Q. You would make these tanks beforehand as protective measure; you would not wait for famine to arrive?

  —The scener we could do them the better.
- 39. Q. What sort of work would you put fomine labour on ?-If I had to open famine work in the Mandri tulnka, looking to the choraeteristics of the people, I would cortainly propose village works, because during the last famino there was n central large work opened for thom where the bulk of them would not go stendily and many people suffered. I should prefer to have small village works.
  - 40. Q. In each village?-No, in a group of five villages.
- 41. Q. The repeiring of these tauks could go on?—Apart from the Alaudvi taluke if we construct tanks, they would lead to an increase in the unmber of kari (rice) lauds. Thet would be a very great improvement. Apart from that, I think, we can very well employ the people in classing any lauds. clearing up lands, stones and weeds.
- 42. Q. (Mr. Ibbetson.)—You told us of one village where the people made a tank, cesting Rs. 2,000 with a small grant from Government?—It was a contribution of the fishermon of a village who serve on steamors. They are not agriculturists, but they raised a popular contribu-tion in the village of Rs. 1,500. They are sailors and most of them own land.

- 43. Q. If thet can be done in one village, why should it Mr. Kadri. not be done generally ?—It can be done. If the Irrigation Department chooses to undertake the work, the people would one forward to pay one-tenth share. Recontly in the Olpad taluat two villages did this by contributing Rs. 400.
- 44. Q. These people paid more than one-tenth?—Yes, because this was entirely a new tank, and thry were auxious to do it.
- 45. Q. Why not have more tanks made?—We can, that is my scheme, we have got waste lands, and we have succeeded in making tanks. I think we shall be able to sweeten the soil and increase the area of rics lands.
- 46. Q. Could you get this done in the coast villoges?—Yes; that is the most appropriate place.
- 47. Q. (Mr. Muir-Mackenzie.)—It cannat be done in Mandvi ?—It is ruther hilly, there is want of sites for Mendvi P—It is rather hilly, there is wast of sites for storage, during my 15 days tour I have been able to find 12 mee sites, which I believe the I'ublic Works Department will approve of, they are in a good entehment area.
- 48. Q. (Mr. Ibbetson.)—Could you get the people to make the tanks l—Na, they are the quest.
- 49. Q. Why are you in favour of small tonks? Why do you not advocate big ones?—Because their number would be small and they would not belp many of the people.
- 50. Q. There is also the question of distribution f-Yes.
- 51. Q. Have you any other objection to big tanks ?- I do not know of any other.
- 52. Q. You would rather here ten tanks irrigating 1,000 nores than one tank irrigating 1,000 acres ?—Yes.
- 53. Q. You get a sure supply from the big tanks? In the case of ample rainfall the supply, ia my opinion, would be more in ten tanks than in one single tank.
- 54. Q. You say that the bania charges 12 to 24 per cent. interest to a cultivator who borrows money for building a well ?- I was talking of Kaliparej (kill tribes.) The money is borrowed not only for building a well but for other ordinary purposes.
  - 56. Q. That is in Mondvi ?- Yes.
- 56. Q Outside Mandvi in the other talukus, what is the rate ?-About 12 per cent. would be the rate.
  - 57. Q. To a solvent cultivator ?-It may be less.
- 58. Q. Could be borrow at 6 per cent. P—For him to obtain that rate he must be very solvent and must mortgage his ernaments. When a banio lends Rs. 300 or Rs. 400, he gets some security and charges less interest.
- 59. Q. (Mr. Rajaratna Mdlr)—There are about 450 tonke which trigate less then 50 neres according to your account?—Yes. In Olpad alone.
- 80. Q. Do you mean t of the total assessment ?we gave this concession so that the people would repair the tanks. I think if these tanks were handed over to the Local Beards with a share of the irrigation revenue and some further grant from the Provincial Funds, and that if the people also give some contributions, there was e chance of improving these tenks.
- 61. Q. Could not the Revoaus Department manage to undertake these repairs with a small establishment?—Instead of ereating a separate ugency I would rather strengthen the agency of the Talukn Beard who would be better able to manage it more economically, the Revoaus Officers would take an interest in the matter and supervise the work of the Taluka Boards.
- 62. Q. Whot facilities bute the District Board for supervising ?-They have get their own staff, District efficere,
- 63. Q. They would be in charge of the Revenue officers ?-Yes in their ex-officio espacity.
- 64. Q. What is the general mode of assessment f-It varies in different talukas.
- 65. Q. (Mr. Muir-Mackenzie.)—What, is the average assessment in Meady: ?—From Re. 2 to Re. 4 per core in Mandyi; in Bardeli I found it varied from Rs. 31 to Re. 41, and in Olpad from Rs. 4} to Rs. 7 per acro.
- 66. Q. (Mr. Rajaratna Mdlr.)—Supposing we considerably reduced the rate, would the rayat be encouraged to construct small private 'tanks'?—Waerever proper may get rice lands, they can't spare them for making tanks.
- 67. Q. Are there not culturable waste lauds?—No, not near rice lends.
- 68. Q. They can convert any land into rice land !- They can, if there are facilities for water.

- Mr. Kadri. 69. Q. (Mr. Muir-Mackenzie) Woold they not be able to cultivate in the bed of the took? Yes, if the tank is 11 Dec. 01. not full of water.
  - 70. Q. In the rabi season they oultivate in the beds of tanks?—Doring the famine they were allowed to do so. I do not think that would lead to a great increase.
  - 71. Q. (The President.)—They are not now allowed ?—No; in fomino years they were allowed.
  - 72. Q (Mr. Rajaratna Mdlr.)—What is the uncul-brable area of the three talukas rooghly ?—I have got it ncourately-

. 71,567 acres. -Olpad . 16,137 "

- 73. Q. Is there a very lorge aree which it is physically difficult to irrigate?—Yes, 71,000 acres ore mostly salt land and subject to the overflow of tidel water. We would have to reclaim that.
- 74. Q. If wasto lands were given on favorable terms would the rayat be encouraged to construct small tooks and to convort the land into kiari land P.—They would.
- 75. Q. (Mr. Muir-Mackenzie.)- On what favourable terms?-Rs. 12 kiari ossessment.
- 76 Q. (The President)—If we reclaim waste land?—They would convert them into rice lands.
- 77. Q (Mr. Rajaratna Mdlr.) Does the fear enhonced assessment prevent the rayat from extending the number of wells ?—No; because they know for certain that there is no possibility of the rate being increased which is fixed by the Survey Department.
- 78. Q Would you employ famino labour to dig kachcha wells ?-Yes.
- 70. Q. Would that not only give employment to famino labour but also benefit the people?— Not to a great extent; it would give rehef to some famino labour, because we cannot give employment to many thousands of people unless we nadertake to construct hundreds and thousands
- 80. Q What is the difficulty in digging hundreds of thousands of wolls?—The difficulty is of supervision.
- 81. Q. It is under the supervision of the Public Works Department !- Yes.
- 82. Q. Instead of giving money in the shape of takavi, would you not grant famine labour ?—The rayat will take to famine labour most readily if you do not wish to recover.
- 83. Q. We do not mean to recover?-If you charge the as Q. We do not mean to recover?—It you can't entray to famino labour employed, then they would not uscept it. First because the famine people are weak and they do not de that quantity of work which a strong, ordinary labourer would de. If you give inducements to a lot of people to take advantage of kachcha wells, you may expect to see hundreds of wells being constructed.
- 84. Q. (Mr. Muir-Mackenzie.)—There is a great distinction between the three talukas in your charge, three differ from one another?—Yes, considerably.
- 85. Q. In the Olpod taluka do you consider there are large arese which may be reclaimed from tidal water?—Yes.
- 86. Q. They would be useful to employ famine labour on ?--Yes.
- 87. Q. You think famino labour may be employed on reclamation works?—Yes, in the shape of tanks.
- 88. Q. And reclamation from tidel water ?-Yes, at present I would like to see if the surrounding embankment would be made to serve the double purpove—the reclamation of the land oud the storage of water; if we have a nice reservoir of water, u good deal of kiari land could be
- 89. Q. You soy in regord to giving omployment to famine lobour; "that is always my iden; have you made any

- proposals ?- Yes; that the tanks should be taken in band on the coast villages.
  - 90. Q. New ones?-The existing ones.
- 91. Q. You say, "they should be employed on making bunds and reolsiming lands from the action of tidal water?"—Yes.
- 92. Q. Take Mandri ?-I understand the country is hilly. Yes, and full of ridges.
- 93. Q. You recommend the bunding of the water courses?
- 94. Q. And clearing oway sand?-Yes.
- 95. Q. Would you advocate the terracing of land in Mandvi?—I do not think so.
  - 86. Q. There is no scope ?-No.
- 97. Q. Yoo granted a good deal of takent for making new rico londs?—In all I have given 2 lekbs of rupces, helf of which goes to the improvement of land.
- 99. Q. How much of that half has gone in making new rice lands?—I have not got accurate figures, but I can gire you the figures.
- 99. Q. Could you give me an ideo, 10,000 ?-I should say something more than that.
- 100. Q. Over Rs. 10,000 have been spent on the improvement of land and making new kiaris?—Bandharas and mostly kiari.
- 101. Q. In Olpad what was the form of famine labour ?-Olpad did not suffer last time; this year they are not likely to suffer.
- 102. Q. In Olpad there is a considerable water-logged orca?—Yes; in the east of the faluka.
- 103. Q. Are now tanks being made there?-There are old tanks, but there is room for new ones,
- 104. Q. The old tanks ore being improved?—Yes, this year by the Public Works Department.
- 105. Q. Do the people pay the enstenth contribution?-
- 100. Q. It is a simple exception of the ordinary rule that if people give 10 per cent. contribution, their tanks should be repaired P-Yes.
- 10%. Q. Could new tanks be made in those villages?-Yes; it would be possible.
  - 108. Q. Have people applied ?-They have not.
- 109. Q. Not the people in your charge ?-No. If tanks are made, the people would make rice lands.
- 110. Q. Mr. Woles told us yesterday that the number of acres raised by tanks is about 23,000 and that the outside area of rice in the district is about 60,000?
- 111. Q. Do you think that new tanks could be made with advantage, so os to protect soon part of the 80,000 neres which at present have no tanks?—I should think so.
- 112. Q. De you think improvement of the existing tanks is the first thing ?--Yes.
- 113. Q. Would you like them to come first ?—Yes; after that I should certainly look to more tonks.
- 114. Q. Do you think there are sites and places where they could be made?—Yes.
- 115. Q. Do you think the people would not give up their lands?—Not in Olpad or Mandri.
- 116. Q. Why not in Olpod?—In the water-logged areas there are lands now looked upon as waste which can be converted into rico londs,
- 117. Q. Water-legged oreas moy be converted?—Yes; if we can store up water we can exente rice beds also.

Witness No. 39.—Mr. A. C. LOGAR, I.G.S., Collector of Broach.

Answers to printed questions.

Mr. Loyun. Poragraph 2-Protected by Government Acres. 1,038\* \*Only nominal tanke protection, as these tanks do not 'octually Protected by private tanks Acres. 1,279 3; 11 Dec. 01. Character of the soil.—Three-fourths of the soil is black or cotton soil, three-sixteenths are gorde or wheat soil, and one-sixteenth is bhatha or tobacco soil.

#### By Talukas.

Jambisar.—About equally divided between black or partielly black and light soil. The last soil in the eastern half is well wooded and contains plenty of sweet water.

Wagra.—Eastern half black : western light and largely salt.

Broach.—Almost all tich black, test bhatha, and a little gorat near the Nerbudda.

Ankleshear and Ransot.-Mostly black; but about 14 villages near the old bed of the Neihadda possess gorat.

Amud. -Three-fourths black soil: rest light, and in the west, salt.

Extent to which cultivation depends on irrigation — To a very slight extent. For normal years this has been shown above. In a year of searcity kachcha wells are dug to some extent, and the area irrigated may be grently increased.

Rainfall.

Demand for water in monsoon.—Ordinarily there is Mr. Logan. no demand for water in the monsoon. But there is some demand for tank water for rice and kodra.

11 Dec. 01.

### Irrigated crops and their waterings.

Jambusar.—Pepper and brinjals are sown in July and require water every eighth day from Novomber to February.

Tolacco is sown in August, and watered from November till January. Onions are sown in November and December and watered till April.

Total area thus oultivated is 150 acres. The irrigation is from wells. No special irrigation cess is levied on this land.

Amed.—The above crops and also sugarcane are sown in 31 neres of land irrigated from private wells. A kee cess of £8-12 is levied.

Wagra.—Inigntion is practically roughed to about ten villages in the east of the taluka with 35 wells which irrigate about 15 acres. The above crops are grown and watered every fifth day in winter. In two of those villages a kee rate of HB per well is taken, as the wells appear to be the property of Government.

Broach.—The above-mentioned crops are sown in 149 acres of land irrigated from wells. The crops are watered once a week. A kes rate of R 12 is levied.

Ankleshrar.—An arra of about 803 aeres is ordinarily irrigated from private wells in about 14 villages with light soil.

Hansot.—There was no irrigation from wells before the famine. Now about 18 acres are so irrigated. About 1,112 acres of rice laud are ordinarily arrigated from tanks during the monsoon. The distribution of the water is privately arranged by the kbatedars. There is no separate irrigation revenue.

The general rule about water revenue in force in this district is that R12 to R4 according to quality of water, otc., are levid on well water taken to irrigate any land on which a water-rate has not been sasessed if the wells were built before the Survey Settlement, or if they are Government property; but not if they have been built or repaired since the Survey.

#### Concessions to constructors.

No special concessions are given to the constructors of new wells.

#### Measures to stimulate construction.

The construction of wells was stimulated by liberal grants of takavi in the famino year; and the practical results up to the present or not encuraging. From Jundusar it is reported that the majority of the 11G wells built from takavi bove been left incomplete, become the water turned out bad or, more generally perhaps, because the unfinished well served a temporary purpose and the builder had never contemplated anything more. The Amed Mamlatdar refers to cases where the water proved brackish or insufficient. In Procedus in Jambusar most of the wells were merely kachcha wells used in the famine year only and now abandoned; but I have also a fine pakka well constructed in the famine, which has not been used since; and probably never will be, because even this year when there was six weeks of drought at an important time, the field round it bears a 16 anna crop without irrigation. In Ilanot most of the Tegai was spent on merely kachcha wells.

In may be said with confidence that it is not desirable

In may be said with confidence that it is not desirable to stimulote the construction of wells in the black soil half to stimuloto the construction of wells in the black soil half of this district for two reasons; first that the cotton crop can probably do with less water then almost any other, and secondly, that the water in block soil wells is sure to be brackish or to turn brackish if the well is made deep enough to get a sullicient capply for irrigation. Nor do I believe that owners of cotton sail would reapond to any stimulus except with the motive of handling Government money on easy terms, and getting a remission of the lean when, as calculated on, the well proved a failore.

In light sail villages, at any rate in those tracts where

In light soil villages, at any rate in those tracts where there is known or believed to be a fairly ample sapply at sweet water (e. g., the north of dambuary) it will be enflicient stimolas to offer takavi liberally, bot on the ordinary terms, to khatodars who apply in good faith.

#### Extent to which wells have been affected by drought of 1899-1901.

Jambusar.—There are practically no irrigation wells to refer to, but some of the drinking wells ran short and others became brackish. The effect of deepening such wells was almost invariably to make them brackish. Only one well ont of 51 deepened improved by boring. Distance of water 50 feet.

Amod.—Some small wells dried up, and the larger lost 80—40 per cent. of their water; and in some cases the water turned brackisb. No wells are said to have been deepened; probably because the california rank well what the result because to make 20 the said by the said to be would be. Depth of water 60 feet.

Wogra.—There were no irrigation wells in Wagra before the famine year. Depth of water 30 feet.

Broach.- In no case was any well deepened, as none ran dry. Depth of water about 50 feet.

Ankleshvar .- Only one well fell into disuse, the wells had to be deepened; but this was probably done with castion, as they are not said to bave gone sait. Depth about 40 feet.

Hansot.-Ko woll required to be deepened in the drought. Average depth 30 feet.

All these statistics refer to drinking wells for the most part as there are few irrigation wells to report on, and what is trace of drinking wells will be approximately true of irrigation wells with the provise that the conditions under which irrigotion wells are made, as regards supply of water

and sweetness, will usually be less favourable then those of drinking wells, which are generally dug in carefully selected ploces on the banks or the beds of tanks.

The cost of wells for irrigation is variously estimated as follows :-

				P
Jambusar				800
Amod .				1,000-1,500
Wagra .			•	7001,200
Brooch .	•		•	300
Ankleshvar			•	600
Hansot .		•		500

It may be taken that a good irrigation well will cost about 4800, and that one kee will irrigate about two acres. I have not been supplied with Mr. Crimp's report on artesian wells.

#### Paragraph 8.

### Water-logged tracts.

Jambusar.—The Mamlatdar mentions a need of small channels for the eastern border of his taluka, another in the centre between Vad and Kāvā and others at Siguras and sandārpar to the soulh. It is admitted that "owing to the light minfall of the last half dozen years" there is not a treet outery for these channels; and that the channel made to drain Jintran about 12 years mgo has ruined the cultivation of rice. The average vainfall of the last six years was 28 inches and the talaka is not likely to get better rain than this at any time; accordingly there would seem to be no need in Jambusar to enter on any of these channels experiments. Jambucar.-The Mamintdar mentions a need of small dangerous experiments.

Amod.—The following tracts are reported water-legged "in very mot years."

Tracts :-

- 1. North of Itola,
- 2 West of Chaldad,
- 3. North of Sadi,
- 4 South of Tancha, 5. North-West of Telod,

and small channels are said to be occded to provent damage to the crops. The question may well be deferred till the to the crops The questi

Wagra —Two channels are said to be required "in very wet years" to drain water from the villages of Aidli and Ochvan-Keshvan; and the above remark applies to them

There are four important drainage channels in this talula constructed from ten to five years ago. They are reported to be ruining the lands they drain by washing away the surface roll; and the people are said to be praying that they be allowed to silt up. A foll report on the subject has been seed to Mr. Beale.

Broach.—Two channels already exist at Vagusna and

There is a tract said to be water-logged in years of excessive minfoll between Sitpan and Nand (north of Janor), and the Public Works Department are believed to have a plan of channel ready as a fumine work.

Ankleshear.—There is already one channel in this taluka. The following 23 villages are said to be still water-logged and to need channels:—

<ol> <li>Anklesbyar.</li> </ol>	12. Adádrá.
2 Pánod.	13. Sarthán.
3. Chaprá.	14. Kánvá
4. Umarrádá.	15. Nagal.
5. Alouj.	16. Sajod.
6 Safipurá.	17. Mándrá Mátiad.
7. Kurmali.	18. Divi.
8 Ravidrá.	19. Hajāt,
9. Pilpdrá.	20. Adol.
10. Pordi Idris.	21. Telmo.
11. Sisodrá.	22. Motwan.

23. Mandwa.

Hanot.—Six villages on the tho eastern border between Mangrol and Godadra are soid to be water-logged for a week after heavy rain.

There are no existing channels in this Mahal.

Drainago chonnels are excavated by the Public Works Department with provincial funds allotted for that purpose. Presumably the Public Works Department will give the statistics relating to the retorn from the existing works, as I have not been celled on to taske coy note on this peragraph of the memorandum; but whatever anticipations are raised from a temporary increase in the quantity of wasteland taken up near a channel at first, may be deshed by relinquishments in subsequent years should the chonnel all produce the resolts experienced in Wogra. At any rate the matter is evidently one requiring the greatest caution and ought to be left to the District Officers. Every proposed channel should be dealt with separately and on its own merits, ead none undertaken without careful inquiry on the spot.

The total number of irrigotion wells in the district is -

					Pokla.	Kachela
Jambusar					341	89
Amod					102	15
Wagro		٠.			40	•••
Broach					839	51
Ankleshvan Hun-ot	}			:	247	G
					1,066	114

II.—Note on the suggestion that rice cultivation should be encouraged in Broach district at the expense of cotton by digging tanks for irrigation.

I would most strongly deprecate any oction by Government to encourage a substitution of rice for cotton in Reach. The notural tendency of the people, who know something of their own interests, is all the other way; if a man has a water-logged field which can grow rice he begs Government to make a drain that he may grow cotton. Possibly in a very wet year there may be a little more to be made out of rice than out of cotton: though not so much as is supposed; for the best cutton fields are said to yield as much as its. So per acre, and no Broach rice field would be likely to yield that. But the instinct which prefers cotton to rice is quite sound. For a district with light rainfall and tanks which will not hald water much longer than it is falling into them, cotton is undoubtedly the best and rice the worst crop to encourage. The following facts

cstablish this, as it seems to me, boyond question. In the r. Logan. M famino year when all crops nearly failed rico failed uttorly in every taluke except Ankloshvar; whereos the cotton 11 Dec. 01. entirely failed in only two talukos, and in Ankleshvar it was as good as the rice. Last year with a rainfall of 31 inches the following was the valoation of the two crops in the various talukes:—

•		Tal	ukes.	NAME OF OROFS.				
		14.	APPS.				Cotton.	Rice.
Jambosar	•	,	•	•	•	•	8	1
Amod							10	1
Wogio	•					•	6	1
Brooch		٠				•	10	3
Ankloshro	r	٠	•		•	٠	10	6

This year results are even more instructive. The highest rainfall was 21 inches in Jambusar; and the average for the district was 20. The rice crop has been a general follars: it may have been as much as 4 anans in Ankleshvar but nothing elsewhere. On the other hand, the coltan estimates (spart from the rats) given to me by my District Agricoltural Iospector are—

Innabnerr		•	•	•	•	•	20 a	nnas
Amod				•			20	,,
Wagm	•		•	٠			12	,,
Broach	•			•			20	,,
Anklesh	var						16	

Thus while in three years of poor rainfall (the fell of 1900 censed too seen, which is the worst fault rain can comult in Bronch) cotton has varied from fallure to abnormal richness, rice has remained at one dead level of feilure. This crop with tanks and all behind it can often not produce a grain where cettra is producing 100 bells to the tree. It is manifestly therefore the most unsuitable crop that coold be suggested for encouragement as a stand-by in time of druught.

Nor it is possible to orgue that rice might be sewn first and cotton subsequently, should the rain or tank water prove insufficient for the former. It would not be possible to foresce the failure of the rice till about the end of August, and it would thou be too lote to sew cottou.

- 3. Q. (The President.)—You are Collector of Broach ? -- Yes.
- 2. Q. What general measures do you consider to be the best to enable Broach to resist famine P—I do not think there is any measure of irrigation which would do any pool, because there is no scope for irrigation. We could not possibly got water.
- 3. Q. There are wells, I suppose ?—Yes, but the water-supply is limited, and they would be of very little use.
- 4. Q. The depth is bayond 30 feet?—Below thirty feet the water is salt; you can get a limited supply af sweet water but directly you increase the supply you spoil the water.
- 5. Q. Is that invariably so?—Almost invariably. Perhaps there may be small tracts where you get sweet water at a considerable depth, but I should say it is true for its of the district.
- 6. Q. Daring the last femine when did the wells give out?—I was not in Breach during the last famine. Practically there is little irrigation from wells in Breach. All the wells give out about the beginning of the dry weather.
- 7. Q. The last famine was very intense and very long; nas there any difficulty about drinking water f—As far as I could learn there was no practical difficulty about drinking water during the whole of the famine. There is always a slight converty of drinking water in the dry season, but I doubt if it was very much worse during the famine year.

- S. Q. We have had evidence that there was a stimulus for the time being given to well irrigation by the construction of kachcha wells?—It made no really meterial difference. There were many hundreds of kachcha wells, but these were dug only for temporary use.
- 9. Q. Did they nat lighten the stress ?-They made no motorial difference. I doubt if 1,000 wells wore dug and that would only mean about 1,000 acres.
- 10. Q. You dan't see any prospect of improving the means of irrigation?—Of all the districts in the Presidency, Brooch is the one which least requires ortificial Irrigation, because, with 17 inches of rain, good crops can be raised.
- 11. Q. You have had only one femine since you can remember ?—Yes, only one within the memory of men; in 1809 we had only 12 inches of rain and the mensoan ceased. During the last twa year, there may have been famine in other parts of Guranat, but there has been no distress in Brown which would be thought anything of, if there had not been a famine the year before. This year with 22 inches of rain we should have had a 16 anna erop in a greater part of the district but for damage done by rats.
- 12. Q. Famine has occurred once and so it may occur again P—Looking up at the statistics of rainfall there seems to be no ground for the popular idea that the rainfall has diminished. The figures show that the present rainfall is better than before.
  - 18. Q. Three years ago you had famine ?-Yes.

Mr. Logan.

- Mr. Logan.

  14. Q. It may come again?—Yes, it may of course, but looking at the averages, there seems to he no reason to 11 Dec. 01. fear that famine will occur for nucther 50 years.
  - 15. Q. Have you any water-logged parts in your district and are they increasing?—No, I should not think that they are increasing. Certain areas were water-logged, but we have dmined them There is a water-logged area still in Ankleshvar, but I have no reason to believe that it is materially increasing.
  - 16. Q. Is there any questi m of remitting revenua on account of it, or of reducing the amount?—There is a letter from the Government on the subject.
  - 17. Q. Do you know of any good done by drainage?— The people were pleased with the drains for the first two or three years, as they could grow cotton instead of wheat. They are now complaining that they wash away the surface soil
  - 18. Q. Have you had occasion to go into these complaints ? -Ne, I have not had time to look at the lands myself. I have only just joined the district since this question cropped np.
  - 19. Q. The Mamlatdar made personal inquiry and his report has been sent to Mr. Honlo?—Yes, that refers to the complaints mode by the people that the channels had done great injury.
  - 20. Q. Has the report gone to the Public Works Department for consideration !—Yes.
  - 21. Q. (Mr. Ibbetson.)-Is it included in Mr. Beale's report.
  - 22. Q. (Mr. Muir-Maskenzie)—Yes; (to the witness)
    —Do you consider that the report can be relied on ?—Yes,
    I think so. I reported that in Wogra people said that the
    land had been spoiled, but that elsewhere there was not the same comploint.
  - 23. Q. (The President.)—I suppose that water-legged tracts bure done best during the last 2 or 3 years?—There is no doubt of that.
  - 21. Q. (Mr. Higham.)—Could you tell me how many wells were constructed in Jambusar?—One hundred and sixteen.
    - 25. Q. Are they kachcha wells ?- Yes.
  - 26. Q. The majority of these 116 wells were left incomplete?—Yes.
  - 27. Q. How are they dug ?-The people excavate a short ay down, and when they get sufficient water they leave the well in that State.
  - 28. Q. The Mainlaton who came here just now said in reply to a question that they were nil pakka wells?—I suppose he called them pakka because they cost Rs. 300. He may have called them pakka but they were very poor pakka wells, they have no steining or very little.
  - 29. Q. Were advances given for them?-Yes, takari was given.
  - 30. Q. (The President)—I see Rs. 38,730 was given f.-Yes, that was the takari advanced for the 116 wells.
  - 31. Q. That is Rs. 334 npiece ?- Yes.
  - 32. Q. (Mr. Higham.) They irrigated 2,000 ncres? They did.
  - 33. Q. Whether they were pakks or kackcha?—Yesonly in that year; they were need only in the famine; no one had made any use of them since.
  - 34. Q. Will they not he used in another famine?—They will all be filled by then. This year our minfall was fifteen inches below the average, and still they did not use thess wells.
  - 35. Q Could you not insist on their completing them having given them fakasi for the purpose f—It is generally found that the man has spent all the money he was given and he would again apply for more money; we cannot so control the expenses as to be cortain that he has spent all the money on the well.
  - 36. Q. He usnolly spends it on something cle?-Yes, very lorgely.
  - 37. Q. Do yon know any of these reclamation works made in Hansot?—No; but elsewhere private reclamation works were undertaken, but none of them succeeded.
  - 38. Q. I suppose it is only a matter of time?—We gave the people 20 years to reclaim the land; but the land is not reclaimed except partiolly, not enough to pay the cost, now they say it is not reclaimable.

- 39. Q. You are speaking of the reclamation scheme of some years ago ?—I am speaking of the reclamation of salt
- 40. Q. I was referring to the works made during the famine ?—I have not got any personal acquaintance with these works.
- 41. Q. You don't know how they worked?-No; but my impression is that you cannot reclaim salt land in under
- 42. Q. It is a waste of money trying to reclaim theso lands?—Yes; in the Wagra talula reclamations v ero attempted and enormous same of money spont on them and yet the reclamations have not paid. In some cases the people have been absolutely ruined to my howledge.
- 43. Q. It may not pay profit from a speculative point of view, but is it worth omploying relief labour on ?—No, I should not think so.
- 44. Q. Would you employ fumine labour on tanks?-No.
- 45. Q. (Mr. Ibbetson.)—You doubt whether the work will be profitable?—Yes. Nobody is satisfied with any of the tanks dug in my district by famins labour. The lorge tonk which you saw is of little good for irrigation and is not required for the supply of the city, which was already sopuled with mater. plied with water.
- 45 Q. Four or five very lorge tanks would be of ne value? -I could not say until I had seen them.
- 47. Q. (Mr. Higham.)—What else would you suggest for your famine labour?—Employment on good reads, which are the great want of the district.
- 48. Q. Where will you get your metal from ?-The metal would have to be brought from ontside, as we have not got metal in the district.
- 49. Q. Would you use famine labour lo make the banks?—Yes,
- 50. Q. Must the roods be metalled?-Tes, if they are intended to last any length of time.
- 51. Q. Work of that sort like railways employs very little labour in proportian to its cost ?-Yos, but we should have something to show for our money.
- 52. Q. (Mr. Ibbetson.)—Do you think you would be able to keep up these metal roads, supposing you made them in the famine?—Yes, the Local Board could do it.
- 53. Q. They would have to import metal?-Yes. We hove made unany reads and keep them is repair; the cost of making a new road is about Rs. 10,000 n mile. The Board now does n few miles every year hesides repairs. If Government provided the capital cost, the Board could spend on repairs the meacy which it new spends on new work
- 54. Q. Do you expect Government to pay for the famine labour and to give you the metal free?—It would be just us good as spending money or necless tanks.
- 55. Q. Not in nseless tanks but on feeding a starving people You propose to employ the labour on the earthwork of roads and to spend twice as much in importing road metal?

  There must be some increased expenditure involved to Government. The Government would have to bear all the expenses, the Local Loards could not, especially in a famine # year.
- 58. Q. I find in your note no expression of opinion obout tank irrigation; you have strong reasons against trusting to well irrigation. Would you do anything to extend tank irrigation?—I do not think tank irrigation is irrigation at all, looking on irrigation as protection against finding; for the or the strong trust tanks of the tanks. when the rains fail the tanks fail.
- 57. Q. Put does not the increased yield put the enliva-tor into a better position to resist famine, and thus there is less likelihood of his coming on relief?—That is so.
- 58. Q. I sappose tank irrigation is profitable to the people?-Yes, for rice.
- 59. Q. Do you think relief labour could be usefully employed is cleaning out the tanks?—I would bave said that tanks are a useful form of relief until 3 or 4 months ago, but I now see cause to doubt it. Wherever I go peopletell ms that tanks are none the hotter for being cleaned.
- '60. Q. Do they give any reason for that?-The old hottom is disturbed.
- 61. Q. Do they ever nek for new tanks?—They ask for ne excavation of village tonks which are used for irrigntion and for cattle.

- ·02. Q. Would you deepen the village tanks?—I doubt the useful effect of opending memory in deepening village tanks; the soil has cracks, so that the more we deepen the tanks the more the water disappears.
- 68. Q. Do you think it is worthwhile doing anything to extend irrigation in Breach?—I think Breach district does not require any extensive scheme. The people are exceedingly shrewd, and good collivators would dig wells no doubt; if they thought wells of any use they would dig them and they can get taken if or the purpose. My experience is that they won't dig wells oven if you gave them the money free; if they did dig they would not use them as it does not pay to draw the water.
  - 61. Q. The unirrigated erop is so good ?-Yes.
- 05. Q. The unirigated crop is so good rates.

  05. Q. Suppose you had another famine next year and relief labourors to be employed somehow, do you think you could do any good to the district by employing them on irrigation works of any cort?—Ro, I should employ them, in the first instance, in digging out village tanks—the area for irrigation tanks is very restricted; it would be simply throwing away money to dig irrigation tanks in black cotton voil, where people are quite satisfied with getting their cotton. They don't want irrigation there.
- 66. Q. They would not substitute rice for cotton ?—I think on the whole that they would not.
  - 67. Q. Thoy prefer cotton ?-Yos.
- 69. Q. Apart from the question of assessment ?—Yes, it is a very hardy crop and a profitable ouc.
- 69. Q. (The President.)—Has the question of employing famine labour to make navigation canals in Breach been considered?—Never to my knowledge.
  - 70. Q. (Mr. & Rajaraina Mdlr.).—There are several tanks in the district?—Yes.
  - 71. Q. Do you think it would be possible to increase their capacity by raising the bunds; you object to disgling and disturbing the soil?—I could not give a professional opinion on that subject, as I am not on Engineer.
  - 72. Q. Is it not generally known that their capacity deteriorates owing to neglect to repair them. Could not famine labour be usefully employed in that way !— Yes, if the Engineers certify that the raised bunds would increase the capacity of the tanks,
  - 73. Q. (Mr. Muir-Mackenzie.) In some parts of your district there are considerable areas of waste water-logged lands? No, not a very large area.
- > 74. Q. An appreciable urea f-Yes, but except in Ankleshwar they are mostly all drained.
  - 75. Q. Do you think that drainings is the best remedy for them?—I do not know any other remedy. It is rather a dangerone thing to do noters it is done very carefully. You may take away more water than you ought to. I saw the draining eachemo that was first started in 1885, it was founded on the basis of draining off 6 luches of rainfull per day.
  - 70. Q. It is only one inch here in Olpad F-I am referring to the report of Mr. Day; he says he found that the heaviest rainfall on any one day was 11 holes, so he prepared a channel to earry off minfall in 2 days.
  - 77. Q. Would it he may use running drains into tanks in water-logged areas with a view to oreate vice cultivation?—I think it is the best thing to drain into tanks below the drains.
  - 78. Q. If you put regulators in the drains you might, to some extent, obvince the danger of taking off too much water f—That is a question for the Engineers to answer.
  - 79. Q. Was famine labour employed on these reclamations you spoke of P.-No, it was private enterprise.
  - 60. Q. (Mr. Ibbetson.)—You say reclamations might take 30 years; but will they succeed in the end?—Of two mon who undertook extensive reclamations one is stone broke. The other has large means and get a good deal of fertile land in conjunction with his reclamation. He won't ted me he has succeeded, for next year the Government assessment falls due, but I think he will stick to his reclamation.
  - 81. Q. (Mr. Muir-Mackenzie.) Do you think the term of granting taken ure sufficiently liberal f-Yes, I don't

- think the rayats ought to be given money at a lower rate of Mr. Loganinterest than we have to pay.
- 82. Q. Could any further simplicity be introduced in the procedure of granting advances ?—I believe that during the last two or three years taken has been given with remarkable simplicity.
- 83. Q. But in ordinary years f—Inquries must be mado; first of all you must know the man's position, whether he is solvent. We ask the Mamlatdars to make inquiries.
- 84. Q. Do you think they are n bit clow?—Yes, in ordinary times, they are; but they have not been slow during the last three years.
- 85. Q. Do you believe that there is misapprehension and unfounded fear on the part of the people that if they make wells either out of their own resources or out of takeri advances they will be charged enhanced assessment contrary to the law P—Yes, they fear enhanced assessment if the well is made in their own land.
- 88. Q. They would be afraid of something more than if they left the land dry?—Yes; it is reasonable, as nobody knows to the centrary.
- 87. Q. It is in the law (reads from the Code, Section 107)?—At any rate the general feeling is that Government is luclined to assess improvements at overy new revision. This morning I travelled along with a wealthy Parseo gentleman who said his assessment had been enhanced 1,200 times in the Revision Survey owing to his baving improved his land.
- 83. Q. No you believe him?—I don't believe him so far as the 1,200 times are concerned.
- 80. Q. You don't think the provisions of the Code are understood by the people?—No, I don't; but I may add that I think that when it pays they will make wells regardless of enhancement.
- 10. Q. Do you think, given took irrigation, rice crops would be more profitable than cotton t—I do not think so, the people would never change cotton for rice. The people are very lary. If an enterprising oultivator uses a good deal of manne with irrigation, I think that a rice crop might be more profitable than a cotton crop, but I am doubtful. There is so little rice in the district that I have never made a comparison of the profits. Cotton gives from Rs. 30 to Rs 46 per acre.
- 91. Q. Mr. Mollison said it might give Rs. 100?—I doubt that except in very exceptional land. The people like growing cotton, because it gives them very little trouble.
- 02. Q. My point is this, if famine relief labour is employed upon digging rico lands it might help the people to grow a mare profitable crop?—I am not sure how far it is a more profitable crop. I have not studied the question. I am very doubtful whether, if rice tanks were made all ever the place, the people would change their cultivation in black roll.
- 63. Q. Aro you aware that rice Is grown with cotton. The notion is intermixed with rice?—Yes,
- 94. Q. I understand from Mr. Mollison that in the year of excessive rainfall the cotton may fail and rice would succeed f-Yes.
- 95. Q. Under these circumstances would it not be possible to grow rice and make it a safer crop f—They have adopted rice in certain areas where there is a heavier rainfall or when they get surface drainage collected.
- 93. Q. You don't agree that the Nerbudda and Tapti would offer splendid opportunities for irrigating large areas of very valuable crops in the Breach district?—No.
- 97. Q. It is said that during the last 30 years there has seldem been a year of good rains. The rainfall teturns contradict it. In former times the people need to say that Breach could not have a familie, because they could set a cotton crop with 17 inches?—I don't ogree.
- OS. Q. We were told by an Assistant Engineer that the population in Breach was without occupation for seven months in the year?—They are fully occupied from June to March or for 10 months in the year; our difficulty generally is the deficiency of labourers.
- (The President).-We were rather astonished at what fell from that gentleman.

Mr. Jivanji.

WITNESS No. 40.—MR. JIVANJI LIMIIBHAI, Lond-owner.

Memo. by this witness not printed.

- 11 Dec. 01. 1. Q. (The President.)—Of what place are you a resident ?—Of Ileo in Broach.
  - 2. Q. Yon say in your Momorandum "during the last thirty years I have seldom seen one year of satisfactory and well-timed rain, and then the orops above mentioned require one or two waterings by artificial means." Has there never heen too much rain?—Sometimes there has been and sometimes scanty rain; it has not been equally distributed.
  - 3. Q. There have not been many years in which there has been a 16-anna crop? No, never.
  - 4. Q. Yoo say "people having black soil lands are anxious for tanks." In the Broach District, I understand, they prefer cotton to rico. Does cotton not pay better?—No, rice pays better.
  - 5. Q. You say "the Tapti and the Nerbadda and the Kesm rivers afford oplendid opportunities for irrigating large areas of very valuable and highly productive lands in the Surat and Broach districts." Are not most of these lands black cotton soil?—Yes.
    - 6. Q. Can they be irrigated by a canal ?-Yes.
  - 7. Q. We have had a great deal of evidence to the effect that they do not want water 2—The rain is not equally distributed so they require one or two waterings for the cotton crop.
  - 8. Q. Does the cotion crop not require water ?-- No, it does not.
  - 9. Q. Do you think people living near the Tapti-Norbudda and Keem would be glad to have canals running through thore ?—Yes.
  - 10. Q. Would the water not go into the oracks in the land and be lost F-It would not go far.
  - 11. Q. Yon say "far from any encouragement heing given to well construction by means of concessions or grants, such construction is positively disconraged by an excess assessment bring chapped on on account of the water-supply from the wells." Is that the case?—Yes, everywhere they charge a water tax.
  - 12. Q. Do they charge a man who makes a well more than if he did not make it?—Yes, the rayats have to pay more.
  - 13. Q. Do you mean if a man digs a well in his own land he would have an extra osces-ment put on in consequence?—Yes, two or three years ago this practically cased.
  - 14. Q. Then it is no use talking about it now. You are no advocate of having drains in talukas like Ankleshar and Oplad. I have heard that people complained that the drains do harm ?—It is a mistake on their part to say so.
  - 15. Q. Several witnesses have told us so i-Dralos are especially required in water-logged villages.
  - 16 Q. (Mr. Muir-Mackensie.)—Is there much waterlogged land in Ilao ?—Not in Ilao, but about three miles away there are water-logged villeges.
  - 17. Q. Is this within your personal knowledge !- Yes.
  - 18. Q. (The President.)—You say "hulding wells should be encouraged and advances should be freely granted and no interest charged on the same," do not people make wells for their own private use?—They have no means.
  - 19. Q. (Mr. Higham.)—Have yoo any land of you own?—Yes, about 400 acres in the Broach District.
  - 20. Q. Have you any wells !-Yes, one well which irrigates five to six acres
    - 21. Q. Where is that well ?- In liao.
    - 22. Q. Do you work it ?-Yes.
  - 23. Q. Why have you no other wells?—Because it does not pay; the cost is so great.
  - 24. Q. Do you recommend that Government should boild wells for you and for others?—That would be very good, the people would like it.
  - 25. Q. It would not pay Government any more than it would pay you ?—In times of drooght and scan; y rain it would pay.
  - 26 Q. Do you propose that Government should pay the whole cost ?—No, advance the money without interest.
  - 27. Q. Aud in what time should it be recovered ?-In 10 to 15 annual instalments.

- 28. Q. If you sunk a well for yourself, do I understand you to say, that your assessment would he increased !— No, that practically ceased two to three years ago.
- 29. Q. In future there would be no charge?—Then the people would sink wells by taking takavi.
- 30. Q. If you could get advances, would you sink them?

  —One or two wells.
- 31. Q. What is your remedy for the Breach District ?— Cacale from the Nerhadda and Tapti would be best.
- 32. Q. In ordinary years you got more water than you maet?—Yes.
- 39. Q. A canal from the Nerbudda would only be for dry years?—In dry years the water would do good.
- 31. Q. In the intermediate years you would not like to pay for it?—The rayats would pay something for the
- 35. Q. Supposing they did not want the water P-Even then they would pay something extra.
- 36. Q. Then they will want to take it ?- Yes.
- 37. Q. They will in that case put too much water on the land ?-No.
- 39. Q. What would they pay if they did not want it?—Re. I extra per nero whether they nanted it or not.
- 39. Q. What reason have you for saying that?—They want it for a crop every year and would willingly give Re. 1 per acre, if they water the crop they will get a 12-sanna crop instead of a 6-anna one.
- 40. Q Wes there great loss of cattle in your district ?-
  - 41. Q. Doe to what ?- Want of fodder.
- 42 Q. Have you any recommendation to moke for meeting that difficulty in the inture ?-Government should keep it to rendiness.
- 49. Q. Why cannot you keep it yourself ?-Government have receive forests.
- 41. Q. What becomes of it now; is it cropped every year?—It is destroyed by fire now,
- 45. Q. Is it cut for the merket every year f-No, it is simply wasted.
- 46. Q. Do you know if private contractors ever offered to cut it !—It would not pay in ordioary years.
  - 47. Q. Therefore Government should do it ?-Yrs.
- 48. Q. It wen't pay Goronment either !- No, it would not.
- 49. Q. In a famine year what should Government do ?— Bell it to the people and they would willingly purchase it.
- 50. Q. But they would have no money then ?-They would take takavi and purchase it.
- 51. Q. Supposing private contractors on waste lands were allowed to cut the fodder on low terms !—There is no great demand io ordinary years and so it would not pay.
- 52. Q.i(Mr. Muir-Mackenzie.)-Somo of the land la gorat and some black soil !-- Yes-
- 53. Q. Which requires most water for Irrigation?— Goraf requires more water than black soil. In sommer time black soil requires a lot of water on account of the cracks.
- 53. Q. Does not black coil run togethor and get sticky? -- Not very sticky.
- 35. Q. In what soil are these wells of yours !-- Partly to black soil and in beser soil.
- 56. Q. There are fewer wells in Broach that in the Kaira District ?- Yes, there are more wells in Kaira.
- 57. Q. Thet seems to look as if wells pay hetter in sandy than in black soil. Does tobacco grow in hiack soil?—Tes, if properly manured.
- 69. Q. Why have people not made wells in black soil as they do in gorat ?—They have no means.
- 59. Q. The soil does not make any difference to their means?—Some people have made wells in black soil also, but they are very few; the expenses ore greater.
- 60. Q. You are a member of the District Local Board !--
- 61. Q. I have understood that you have a great deal of influence with the people ?- Some people think so.

- 62. Q. I remember you induced them to do n good many useful things, don't you think a man of your influence could induce the people to repair their tunks ?—I could induce them if they had moons.
  - 63. Q. Have you tried P-Yes.
- 64. Q. Have you succeeded F. I succeeded in getting some portion of the toluku to give u subscriptice.
- 05. Q. Why could not you make the people do it them-selves ?—They ere very peer.
- 06. Q. They govo money for the contribution?-The contribution is a small portion.
- 67. Q. Still in tanks where there is not much to do, could not they do it themselves ?-Yes.
- 69. Q. They never do !--People cannot afferd it, when a thousand or 500 are required, they could advance Rs. 10 ar lo but not more.
- 69. Q. No person of influence could induce the recopic to repair their tanks?—They are Government tanks and Government charges a water-tax, it is the duty of Government to repair them the people contribute ene-tenth.
- 70. Q. Supposing Government remitted the tox, would the people repair the tanks ?-Yes.
- 71. Q. A mambatdar said in evidence that out of Rs. 6 assessment about six names was tank assessment?—Ho was wrong; as far as I know the assessment is Rs. 4 to R. 6 per agre, and rice Rs. 10 to Rs. 16; that is the water-tox.
- 72. Q. Even if rice is under n tank it would never pay according to the mamintdar?—That would be a sub-soil nuter-tex, not a took tax I think.
- 73. Q. If Government remitted that tank tax and nothing else, would that be a sufficient inducement to repair their tenks?—Rs. 6 per sero is a great deal.
- 74. Q. I understood you to say that It was the sab-soil that made up the big tax?—The sub-soil is from Re. 0-6 to Re. 0-12.
- 75. Q. Would you like Government to edronee money free of interest ?—Yes.
  - 70. Q. And the capital to be repaid !- Yes.
- 77. Q. Supposing Government did not osk for repayment of capital, but charged an assersment on wells f-Somo people would like that.
- 78. Q. Would you supposing Government gave yon the amount you required for the well and then asked you for some tax per acre on the laud irrigated by that well P-Yea.
- 79. Q. How much would you be prepared to pay ?- Rs. 4 per sere.
- 80. Q. You think there is a lot of water-logged land in your neighbourhood ?-Yes.

- 81. Q. Whot is the best thing to make that fit to be Mr. Jivanji. taken up for cultivation again t.—Droinage.
- 82. Q. Some reduction of assessment would not be sufficient P-The assessmeet should be reduced besides boring draios.
- 83. Q. Do you think mny moderate reduction of assess\* ment without dreins would make the people take up these lands P-No.
- 84. Q. If a lorge conal were made through Ankloshvar taluka in the part of it which borders on the Keem river and the Nerbudda that that would be on excellent thing for the employment of labour ; a great number of people would be omployed ? - Yes.
- 85. Q. Do a great number of people require employment ?—Not is ordinary years.
- 86. Q. Have you difficulty in getting labour in ordinary years ?—Yos, often.
- 87. Q. Do you get people lo harvest your orops from a distance ?— From six to ten miles.
  - 88. Q. Not further ?-No.
- 80. Q. In the Deccon people travel from 50 to 100 miles f-That is not the case here.
- 90. Q. Which would you rather see n canal or more roads ?—A cacal.
- 91. Q. Does not the District require roads very much? -A eart track would be better.
  - 02. Q. Sometimes people den't like roads ?-No.
- 93. Q. You have told us that there ere mony bad seasons and that some are due to excessive roln ?-
- D.L. Q. And that increases the water-logging P-Yes, only one year in thirty have I seen excessive rain; that was in 1879, there was then more than 110 inches of raie.
- 95. Q. I see that ie the statement of rainfall from 1887 to 1901, ottached to your paper, you show 57 inches in 1803, is it more important that the roin chould be well distributed than that it should be of any particular quantity?—Yes. If min is sufficiently well distributed, 50 inches will be enough for cotton and wheat.
- 93. Q. Did you erer before 1900 have a severe fedder scarcity?—No.
- 07. Q. A good many wells were dug in the famine year? -Yes, kacheka wells.
- 08. Q. Were they of any use ?-I dng six or seven wells, but they did not pay.
  - 09. Q. Was the fedder grown under them valuable?-Yes.
- .100. Q. They kept alive your cattle !- Yes, but we could not get sufficient water of the time.

## TWENTY-FIRST DAY.

### Dhulia, 14th December 1901.

WITNESS No. 41 .- Mr. A. H. A. Sincon, I.O.S., First Assistant Collector, Satara.

Answers to printed questions.

Point 6.—This is the only point on which I wish to express a decided opinion. Having lived for avo years among the patasthal irrigators in the north-east part of Nanik district. I am firmly convinced of the advantages of the pot-bandhara system and of its applicability to other parts. The bandharas were for the most part constructed in old times. There must have been 40 or 50 in my charge irrigating various areas from 600 acres to 16 or 20. All Government do to the part of the part works and see that the 14 to keep up the handharas and head works and see that the puts are sound. The villagers have to clean the pats and distribute the water. The Executive Engineer, Infigation, distribute the water. The Executive Engineer, Irrigation, Khandesh, can doubtless give the figures of expenditure, as well as those of water-rates, which vary greatly, and of total income. The rates are fixed, and ne remissions are given for failure of water as a rule. I tried to get exceptions made in some very hard cases. The new bandhara at Kanasi, Taloka Kalwan, and the new bandhara at Morana Sandas, Taloka Baglan, were built during British rute. Divisions of pats have been made at several places, e.g., Valvada, Taluka Malegaon, Jnykheda, Thluka Baglan, Nikvel, Taluka Baglan. These divisions are usually to avoid creation by nallahs, etc. They were not done as famine works. There

are no District Board baudianes. There is an Inamdar's Mr. Simcox. bandhara at Arni, Taluka liaglan. It is not well kept up and is very old. I want the Buglan system to be tried in Satara district. I should like an experiment to be made on the Krishna just below Wni. If that succeeded, more might be done. I spoke to Mr. Beale about this matter when he was in Satara. He said he hoped to take it up nfter scoing the system at work near Malegaon. Baudharas are no use to increase the water-supply for drinking. They are no use to increase the water-sapply for drinking. They should only be unde on living streams and if there be a living stream there is ample drinking water. I think the streams might, in some cases, be increased in volume by the construction of storage reservoirs near the Ghâts, particularly in the case of the Girna River at Chandkopur (this is an Imperial work already commenced in the fomine), and in the case of the Alexan River above Mulher (this project is not occupieto).

There are a great many improvements to existing bandlarns and pats in Baglan and near it which might be made very cheap. I sent in a list of these to the Collector of Nasik when I left charge last December, and another list dering the rains when the Commission was first announced.

Mr. Simcox. These are matters of detail affecting but a few acres each.

Still they ought to be done.

14 Dec. 01.

Still they ought to be done.

Point 7.—I have seen o great mony wells and advaced a great deal of money for them in the Molegaon charge. But I have no figures hy me. I may he able to couvey some information orally in o general way os to wells. It is my opinion that they are not so useful as bandharas where the lotter ore available. Well-irrigation is not suitable to the Maratha character. It takes too much time and labour. If he can get on with a dry crop he generally will not troable to work the mot. But with a good pat he has only got to watch the water ran. Hundreds of wells are deserted as soon as o fomine is over. deserted us soon us o formine is over.

Point 8.—1 only know of ooe cass at Patna, Taloka Malegnon. The water-logging is artificial. This is oue of the small improvements I spoke of at the end of point 6.

the small improvements I spoke of ut the end of point 6.

Point 9.—The ooly remarke I could offer which weald not better he made by Public Works Deportment Officers are as to village tanks and small road works in the Malegaoo chorge I had 14 village tanks deepened in May and Jane 1900, and two smell works to moke roade good eneagh for country cauts over passes where only foot traffic had previously existed. All these small works were successful in their objects. The tsuks were helding water well, and were much appreciated by the villagers when 1 left. The pass roads were also u great souvenience. These small works can be started in one form or another in most districts. The difficulty of supervision is that most felt. If a lorge establishment is appointed, it swallows up the grant for the work or a disproportionate part of it. I found that near Malegaon local gentlougon undertook the supervision a lorge establishment is appointed, it swallows up the grant for the work or a disproportionate part of it. I found that near Malegaou local gentlouou undertook the supervision of such works were such as would benofit them and their neighbours, oud there was a spirit of good fellowship which mode mattere easy. This could not, I fear, be expected in ull districts. I should like to see the Chandkapur Tank and the Girna Left Bank Canal project completed. It has been banging ou for 25 or 30 years. I believe it would pay better thou most similar projects. On too other points I do not anticipate that any remarks of mino would be of mach value.

#### II. -General.

1. The Malegaon Division of Nacik district. I was there five years and was impressed with the excellence of the pat-bandhara system and want to see it extended to other parts, my present charge (Satara) being one ench

#### B .- Canals of Continuous Flow.

B.—Concile of Continuous Proc.

Preliminary.—I take it that what is meant by the shove heading is what I should describe as "large canals," i.e., such as irrigate lauds in many villages cod whose coarse extends over many miles. The canols of which I am on advocote are such as only irrigote the louds of one village each as a rule. They originate io rivers near their sources which are dammed with masonry dams, and the canols are sopplied with elementary head works which can be managed by the villagere themselves. The system is only applicable in the Decean to the country within 50 or 60 mits of the Ghâts. Boyond this the rivers grow too wide and deep as a role to admit of the economical construction of each dams. The typical river to exemplify the system is the Mosam which rises in Salher Fort and joins the

Girna uear Malegaon—a coarse of ubout 52 miles. For over 40 miles of that distonce it has a bandhoro practically every 1½ to 2 miles, sometimes closer. Out of the river at each houdhara flows a small canol or påt obout 1 or 1½ miles loag, which irrigates village lands in varyiog quantitiee—rauging, so far as I remember, from 20 to 600 ucres. The bandharas were in every case hot one hoilt in praBritish times. All that we have done is to improve the head works and to divert the obaonels in places where erosion was taking place. The cultivation in that port of the conotry has grown to he a fice ort, and the crops produced are magoificent oe a rale. But the system seems to he n purely local growth. Trao, one finds kachcha handharas in most ports of ihs becam, but enything like the pakka bandharas of Masik and Khaudesh are very raro. The special points of the system uppear to me to be (1) cheapness and (2) essiness of working. Once the dam ond head works are put up, there are no expenses and no establishment required nulses, of coarse, the dam be woshed away or some such calamity happen. The irrigators are responsible for cleaning the pats and distributing the wnter. The dams themselves are not expensive, as they are erected only where the river hed sapplies a good rock foundation. Such sites are available at frequent intervals.

7 and 8. The irrigation being ancient, there is no means of calculation the invesses in visid on value of the load.

7 and 8. The irrigation being ancient, there is no means of calculating the increase in yield or value of the land under yats. Drought does not affect them if the rivers and sites are well obesen. Alalegaon has not had anywhere near its normal rainfall since 1896, but when I left lost year the patesthal land was still doing well. The flow of the rivers was much reduced, it is true, but we cannot expect to have a recurrence of four or firs years' drought.

9. (3) The pots all belong to Government. The rates varied from shout Rs, 5 to Rs, 15 per acrs. The last rate was that of a few villoges near Malegson. Dry land la them was assessed at Re. 1 to Rs. 2-3 per acre.

10. The system is that each irrigating village has one or more "patkoris" or "hovildars," who are village serrants responsible for distribution the water in accordance with the terms fixed by the village panel. These men receive remuncration, as other village servants do, as watendors in the shape of main land or cash allowonees coupled with haks. For the annual silt-clearing and on other emergencies the Patil calls out all the principles of the province of

11. There was no case of too profuse or extensive irriga-tion that I remember. The channels merer wont far from the river, and the irrigated lands generally drained thom-selves into the river to which there was a natoral slope of the land. I only remember one cose of water-logged loud at Patna, Tolnka Malegaon, of any extent. When I left I was trying to get the Executive Engiseer for Irrigotion, Kbandesh, to remedy this by making a cut to the river.

I hars put my remarks under B, because a properly placed bandhara ebould ensure a cootinaous flow. No doubt many of the pats in my former charge bave been decidedly intermittent since 1898, especially these on the smaller tribotaries of the Giran. But then the drought in that particular charge has been extraordinary. I may instance one village (not irrigated but within two miles of the rivor) where corn two feet high has not been grown, eince 1895. In such circumstances small streams must run dry. On the other band, the pats on the Giran itself and most of those on the Mesam were working as usual. most of those on the Mosam were working as usual.

- 1. Q. (The President)—You have bad some experience of the Nosik district?—Yes. I was nearly five years in the Malegaco charge which adjoins this district.
- 2. Q. The country is similar to this district?—Very similar to Pimpalner taluku.
- Q. Were you there right through the famines of 1896-97 and 1899?—Yes.
- 4. Q. Was the former the worse of the two famino years? No, the latter wosfar worse. The number on relief in the latter famine was five times as large as that in the former.
- 5. Q. You are intimately acquainted with the bandbard system ?-Yes.
- 6. Q. The system is pecoliar to these parts ?—I have never met it in such profusion elsewhere. I have never seen pakka bandharos elsewhers mode by the people of old on their own account. There are pakka bandharas in other parts made by Government.
- 7. Q. Do you know the haodhara close hero f-No. I understand it has a tank to feed it. The old bondhares . had no tunks,
- 8. Q. Never ?-No.
- 9. Q. The one referred to is a better sort of haudbara?—Possibly. The old bandhora; were made simply by diverting the living stream. The Mossm River runs through the Malegson charge for 50 or 60 miles, and ot almost every mile there is a bandhora. Usually the only masoury work connected with each is the cluice at the head. Each bandhara as a rulo supplies one villags only.
- 10. Q. Does this river flow oll the year round ?-Yes.
- 11. Q. You say the bandhara sopply only one village ach ?—As a rule, sometimes one bandhara supplies two villages.
- 12. Q. Mr. Gahagau said that soms eerved more villsges ?—He may have heen referring to the Paujhru River which ruus throagh Pimpaluer ond Dhulia talukas.

The Pimpalner and Baglan talnkas are not supplied by the same stream.

- 13. Q. Mr. Gahagan said there were disputes about the stranms in various villages P—Yes, owing to short supply of water. For instance, I have known cases where the people of one village have unfairly heightsned their bandhara by making mud dams on the top of the masonry. This gives them more than their fair share of water.
- 14. Q. The people on the lower course of the stream are jealons?—Yss. These quarrels are only sommon when the streams run low, and it should be remembered that since 1897 we have averaged only 11 or 12 inches of rain in the year instead of some 25.
- 15. Q. (Mr. Ibbetson.)—Was there plenty of water in 1896 r—Yss. At the end of July 1896 10 inches of rain fell in one day at Malsgaon. This heavy fall filled all the
- 10. Q. The streams went on running although there was no rain after July ?—Yes.
- 17. Q. (The President.)—We saw a lot of streams in Gajamt which do not flow all the year?—I do not know Gujarat. The rivers hereabouts have large catchingua. The simplified the applicate of the water-peoply in 1896 I may say that there is a small ditch which runs into the Messay Usually it is dry, but in 1896 it flowed all the year round and irrigated 200 acres. The people say that it flows only once in 12 years, in Sinhast year.
- 18. Q. Each bandhara bas a caual leading down from it?—Yes. The channels are managed entirely by the villagers, except on rare occasion, e.g., whou a channel is washed away by a flood. Thou Government repair it-Ordinary repairs, such as sitt clearing, are done by the
- 19. Q. De you know how they manage the distribution of water? Have they any fixed plane?—They know their irrigated land thoroughly. The rotation is all cut and dry, and is known to the whole village. They have no occasion to roter to the Public Works Department in these matters.
- 20. Q. You say in your written evidence "The new bandling at Kanasi, Talaka Kalvan, and the new bandling at Morana Sanda, Talaka Baglan, were built during British rule f"—At Morana the Public Works Department built o new bandhara to raise the level of the canal. At Kanasi the old bandhara was ruined and was entirely robuilt. The irrigating class had all left Kanasi, and now irrigators were brought in in my time and irrigation was recommenced.
- 21. Q. Did the new caltivators' ancestors live there P-21. Q. Did the new collivators' ancestors live there?—No, they cause from different parts of the country. I advertised the laud to be given for urrigation through the talaka officers. Alr. Stowart really started the idea which was carried out in my time. The old villagers had ell fallen into the lauds of the sevkars, who are Telis by caste, that is, cilsellers. The savkars got possession of the land, but did not take the treatle to irrigate. The old villagers all left the village. In 1898-09 we offsred the land free of occupancy price. A let of people were collected from various parts of the district, but none belonged to the old remaintien. old population.
- 22. Q. The old bandhara was entirely rained ?—Yes. The new bandhara is a maguificient one.
- 23. Q. The people usually resent new bandbaras ?-Yes. Thore is generally much irrigation on each stream that there is little room for more. There is plenty of irrigable land, but the water in the stream will only irrigate a critain quantity. When a man bays up a piece of hand adjoining the present irrigation, he often asks to be allowed to irrigate it. This can seldom be permitted, for the people generally know the limits of possible irrigation, and have already carried it as far as possible.
- 21. Q. Do you know whether at the tail end of the river all the water is used up P—The Commission is about to see the Janada Canal, which is fed by the Girna River below all the bandharas.
- 25. Q. (Mr. Robetson.)—You say all the bandharas take off above the Jamda Canal ?—Yes. The Girna is a very strong-flowing stream. The great rivers such as the Bhima and Krishna dry up, but the Girna never.
- 20. Q. (Mr. Muir-Mackensie.) Does the Krishna dry up F-Last year there was no stream running. I have seen the Godanari also dry, but the Girea always runs.
- 27. Q. The Girna runs through the Malegnon charge ?-
- 28. Q. You say you want the Bagian system to be tried in Satarn?—Yes, very much.

- 29. Q. Is there anything to account for the comparative Mr. Simcox. failurs of kackéke bandbaras?—I have seen some such bandbaras laboriously built of brushwood, stones and earth. 14 Dec. 01. In a few moments during a thunderstorm the stream may wash all this away and destroying all the work and rendering the avanaged and ing the exponditure useless. A fresh start is uceded, and one season may ontail great trouble and expense. ing the expenditors usaless.
- 80. Q. You say "I think the streams might in some cases be increased in volume by the construction of storage tanks near the Ghâts." Is there any such project in exist-occe?—Yss, the Chandkapur Tank.
- 31. Q. Is it in execution now ?-I do not know. It is. a vary large project.
- 32. Q. If you iccreased the supply to the bandharas, would that increase cultivation?—Cortainly.
- 33. Q. (Mr. Ibbetson.)—Government would not got any return?—Certainly they would, Irrigated land near Malegaon is paying as mach as Rs. 15 or 16 per nore.
- 34. Q. The water belongs to the land-owners in the villages and they dispose of it ?—They have an immemorial right, subject to the payment of water-rate.
- 35. Q, How is the irrigation carried out?—If a village's lauds measure 500 acres, perhaps 200 of that could be irrigated. The ideal farmer has a plece of anirrigated land, and a piece in each of the 3 divisions of the tal' or irrigated area. These 3 divisions are coropped in rotation with rice appearance and wheat or gram or other grain. with rice, sugarcane, and wheat or gram or other grain. With rice, sugarance, and wheat or gram or other grain. The villagers manege very well among themselves so as to equalize the profits, for of course very few have land in all the divisions. Anyhow in three years all works out level; if a man has only one field he gets rice one year, sigarcans the next, and grain or pulse the third.
- · 36. Q. Did the people raise any objection to the Chand-kapur Tank?—No, but it was not carried out.
- 37. Q. (Mr. Mair Mackenzie.) Was there any difficulty S7. Q. (Mr. Main Mackenzie.)—Was there any difficulty in carrying on the work during the famine?—Yes, owing to superstition. The people have a tals of a geblin having been killed in the riesr, which is anyposed to make the water bad and the ellmate foverish. The people are very superstitions and when choices broke out were convinced that the geblin was the cause. So they ran away. All the same, if these two reservoirs were constructed, they would an immarsa amount of good. do an immerse amount of good.
- 38. Q. You mean the Chandkapor and Mulher reservoirs P.—Yes, for both are on running streams.
- 39. Q. Are there such perennial streams in Satara district?—Yes. There are many streams near Satara with beautiful sites for bandbaras, where there is rock founda-
- 40. Q. (Mr. Ibbelson.)—l'eronnial streams ?—Yes, e.g., the Krishna in Val taluka, which is perennial except in years of great drought, I could name others, but have not experience of all the streams in the district.
- 41. Q. The water in the channels is very seanty in May and June?—Yes, in most, but some are full all the year round. In others no sagercano is grown as the supply is not certain in the hot weather.
- 42. Q Do you know of any other places where tanks could be made besides Chandkapur and Mulber ?—I know of some sites which seem good. Whother they would really be profitable is a matter for an engineering officer to decide. Mr. Ali Akbar wout through the above two projects with
- 43. Q. You say "I have seen a great many wells and advanced a great deal of money for thom in the Malegnon charge." Can you give figures?—I am afmid not. I had been transferred to Satara when I wrote that.
- 44. Q. You say "Well irrigation is not suitable to the Maratha character" That is what I have found as a general rule. Hundreds of wells were dug in the 1896-97 famine. In 1898 there was a good dry bajri crop. Hence the cultivators, having got caungh to live on without troubling to irrigate, let their wells suit up.
- 45. Q. (Mr. Higham.)-Thoso wore kachcha wells?-Yes.
- 40. Q. Were these wells efficient P-Yes. In 1896-97 there was ample sub-soil water.
- 47. Q. Were they ofterwards abandoned? -Not all, but very many.
- 49. Q. (Mr. Ibbetson.)—Would you expect kachcha wells to be used for long ?—Yes, with care. But as a rule, if there is a good season well irrigation is noglected.

14 Dec. 01.

- Mr. Simcox. 49. Q. Without making them pakks they would not last?

  No, they would fill up in time.
  - 50. Q. (Mr. Muir-Mackensie.)—The expense of making a well pakka is not a smell matter in times of famine?
    —Just so, it is not.
  - 51. Q. What do you think is the cost of a pakka well?

    A small well snoh as they make heresbonts might sverage Rs. 150.
  - 52. Q. In Gujarat it costs from Rs. 750 to Rs. 1,000 P Here they make very small wells, generally for one or two mots only. As n rule they do not use chunam massury axeept for the parapet. In Dahbedi village alone 80 welle were dug during the last famine.
    - 53. Q. In 1899 ?-Yac.
  - 53. Q. In 1899 F—Yac.

    54. Q. (The President.)—What area will each such well irrigate?—As a role from 1 to 2½ acres. But in 1899 the rainfull was very ecanty and the sub-soil water very low. Also so many wells were dug that in parts there was practically a well in every field. The consequence was that the wells failed to Irrigate more than ½ to ½ acre. The complaint was that the soil was so dry that it drank up a greatdeal of water and the whole capacity of a well was needed to keep a very smell area moist.
  - 55. Q. What is the soil of the Malegaon charge? Is it generally black cotton soil?—In the vellsys there is some black cotton soil, but as a rule the soil is shallow and mixed with muram.
  - 56. Q. (Mr. Muir-Mackenzie.)—The irrigation under bendharss is not on black cotton soil ?—As u rule, no. The soil is often very poor stuff. It is very henvily manured Thera ure places where thera is deep black soil, c.g., Kanssi.
  - 57. Q. (The President.)—What about tanks in these talukas?—There are a good many in the Malegaon taluka. They are village tanks
  - 58. Q. (Mr. Ibbelson.)—Not irrigation tanks ?—Nn, not one of them.
  - 59. Q. (The President.)-Thay are small and for drinking purposes only ?-Yes.
  - 60. Q. Are there no irrigation tanks in the charge?—One, a Public Works Department tank.
  - 61. Q. Is it far from eny river !- No, it is on the conrse of one.
  - 62. Q. In Satara district there are a good meny small rivers P—Yes, and they bare rocky beds in places suitable for making bandhatas. I'bo Krisbna is practically a perennial stream, and so are several of its tributaries, on which bandharas might he built.
  - 63. Q. There is no rule, I understand, inforce the people to keep the irrigation in order ?—None, but their own interest.
  - 64. Q. The Irrigation Department bas a clause which compele the villagers to do ordinary repairs?—Tes, but the villagers are not eapable of anything but just keeping the channels in working order. In cases where, as at Saogachangers are not expanse of anything but just keeping the chennels in working order. In cases where, as at Ssogn meshvar in Malegaou taluka, the channel runs along the rive hank, it sometimes gets washed away by floods. The villagers estude to expected to rebuild it. The vil-
  - 65. Q. In avery patasthal village yon have Inamdars connected with irrigation ?—Yes, they are called Patkeris or Havildars and are responsible for the distribution of the
  - 66. Q. Inside their own village limits?—Yes, they are under the orders of the Patil.
  - 67. Q. (Mr. Rajaratna Malr.)—It is entirely a village distribution?—Yes. It involves constant work night and day, for as soon as one field is watered the channel has to be deverted into the next.
  - 68. Q. (Mr. Muir-Mackenzie.)—Ha plaints about unfair distribution ?—No. -Have you had any com-
  - 69. Q. That is, un formal complaints ?-No.
  - 70. Q. Yon have had petitime ?—Yes. The cause of complaint is easily removed. If one Patkari will not work we turn him out and put in nuother.
  - 71. Q. Have yon ever done that ?—Yes. They are subject to the Watan Act. If they do not perform the eservice of their Watan, they are liable to be turned ont.
  - 72. Q. (Mr. Higham.)—You are speaking mainly of bandharas in the north-east pert of Nasik District !—Yes.
  - 73. Q. You say they do not require any storage reservoir?—As a rule they work very well without, but the reservoir would make the anpply more even.

- 74. Q. Dislant villages would get but little benefit from them P-I do not say that.
- 75. Q. The main object of the Chaodkapur Tank would not be to encore the present irrigation P—No, the main object is to fill the Girna Left Bank Canal which would irrigate a dozon new villages, including a little patch of country which has bad no minfall for six years.
- 76. Q. (The President.)—No rain for six years ?—They have not had enough rain to bring bajri to ripeness since 1898.
- 77. Q. (Mr. Higham.)—The Girnacventually flows down to the Jamda Canal ?—Yes.
  - 78. Q. Is the Chandkapur project a big scheme ?-Yes.
- 79. Q. It involves the construction of bandharas at frequent intervals down the river?— Yes, but there is nnly the isitial expense. There is but little recovered expense for establishment.
- 80. Q. (The President.) -The sites eod remsine of some of the old haudharas exist and would be used?—Yee.
  81. Q. (Mr. Higham.)—There are baudharas already working in some parts?—Yes.
- 82. Q. Soppose yon baild a handhara and take water along a shannel, coold you not irrigate more than one village?
  —Yee. I auppose it could be done.
- 83. Q. Could you give un instance of soch a system already working?—No. I do not know of a case.
- 84. Q. If you wanted to take the water further out into the country, your works woold have to be larger ?-Yes.
- 85 Q. (The President.)—What prevests the water going further P-The levels.
- 86. Q. (Mr. Higham.)—I approse the same system abtains on the Mosam ?—Yes.
- 87. Q. What is the length of the channels?-From 1 to
- 88. Q. (Mr. Ibbetson.)—Are there aquedocte in and cases?—Ooly where the Pablic Works Department have huilt them to improve the shannels, e.g., at Kansei and Kalman
- SU. Q. When you speak of 20 or 30 bandharas in 40 miles, how do you distribute the supply ?—Is it enough fur all ?—Yes, as a rule during the last few years the minfall has been extremely scanty and difficulty is being felt.
- 90. Q. Rach bandhara takes as much water os it likes Yes.
- 91. Q. At the bottom of the irrigotion the averflow get back to the river again ?—Yes.
- 92. Q. If there were storage tanks you would get a greater flow ?—Yes, that was Mr. Ali Akbar's idea. He eaid that if the Malber Tank were built the Mosam would be quite safe from failore.
- 93. Q. The echeme was not passed ?—It had not been fully prepared. Mr. Gabagan can tell you whether it has yot been sanctioned or no.
- 94 Q. (Mr. Higham.)—If the tank slways provided water you would be hetter off than at present?—Yes. Among other things the drinking supply of Malegeon town woold be assured.
- 95. Q. If a storge tank existed, would more bandbaras be hull? Not on the Mosam.
- 96. Q. When the supply ran short, how did you settle the dispotss ?—The people generally estiled them among themselves. In one or two cross [there were querrels, but this was the exception.
- 97. Q. I was not rofer ing to distribution within a village, was epeaking of the distribution between your 40 handams. The bandbaras down the stream would get no water in a bad year ?-But they did get it.
- 98. Q. Did they get water in the last had year ?—Yes certain amount. The hest handharas of all is at Nampur about half way down. The river there always runs.
- 99. Q. Do you pot any restrictions on the appar band-haras, or allow them to take what they can get?—They take what they can get
- 100. Q They are not allowed to 'enlarge their cluices?— The elsices are pakka and made end repaired by the Irrigation Department. I do not know what was deep before that Department came into existence. I suppose there was some kackeha arrangement.
  - 101. Q. Thoy take as much water as they can get ?- Yes.

- 102. Q. The Chundkupur Tauk in your opinion should be wurked on an identical system ?—I believe so.
- 103. Q. Under that system the bandhurus down the stream would get an unfailing supply of water ?—Yes, not only so but the Girnu Left Bonk Cunel would be filled.
- only so but the Girnu Left Bonk Cunol would be filled.

  104. Q. Why did Mr. Ali Akbur propose this canul instead of a succession of more bundhares?—Bandharas to pay chunld be capable of being built cheeply. There are tew suitable sites un the Girna, which is a broad stream with steep banks and soudy bettom. Bondharas can only be built cheaply where there is a rock foundation. But Mr. Ali Akbur proposed not unly to make the caual, but to extend arrigotion under each of the existing bundharas. As to the Mulher scheme, that is to encure the flow of the Musam, which is not so safe as the Girna. While it does not run quito dry, still the supply is often too little for sugarcans crops, and the assessment is based un u rotation including sogarcane.
- 105. Q. Yuu would intercept the streem by hendharas nt every village and still have enough water?—I speak of Mr. Ali Akbar's schome us I found it.
- 106. Q. (The President.)—You think it a good one?—Yes.
- 107. Q. (Mr. Higham.)—You think small canuls are preferable to lurge?—I think they are worked cheaper. Without going intu details, I believe that in the Decean the working expenses of a lurge canal generally cat up ull the profits.
- 108. Q. Wuuld not those people make bandharas themselves ?—It is a matter of probibitive expense to them. A small bandhura is estimuted to cost at least Re. 5,000.
- 109. Q. If you get this Girna canal, I suppose you will have to introduce a water-rate ?- Cortainly.
- 110. Q. On the present baudhoras you have wet assessment P-Yes.
- 111. Q. It depends on the area irrigated P-No. it is a permanent acreage assessment on the area irrigated which does not vary.
- 112. Q. You caleglate that u bandhara will irrigate so many acres P—No, the area has already been fixed by oustom. The lend is assessed at a dry rate to which is added a wet-rate according to the crops to be grown, and the two lumped together are the assessment.
- 113. Q. It does not fluotunlo?—Not in the permanent irrigation. In the cose of smell streams of uncertain flow, where water is only occasionally taken, there is a fluotuating rate called pankasar.
  - 114. Q. This ussessment is paid nunually ?-Yes.
- 115. Q. Whatover the area irrigated f-Yes, but in practice the full area is always irrigated.
- 116. Q. If they take more water than they want, what happens ?—It flows back to the rivor.
- 117. Q. Do they never use the aversum to surreptitleusly irrigate extra land?—Sometimes, but the people below seen find it out by the short flow, and stop it.
- 118. Q. As a motter of fact, little extra irrigation takes place? Very little.
- 119. Q. If the Chandkapur scheme is carried aut and you increase the irrigation, how will the land he assessed P—Presumably un the old lines. There will be a little friction at first. I have talked the metter over with villagers, whu protested that there would never be enough water to go round.
- .120. Q. Are people easer to get irrigated land?—They take it greedily. I used continually to be bethered with applications from cultivators below the existing irrigation asking for permission to irrigate. I used to refuse, for the people on the next bradhard below would be certain to raise quarrels, and even if there were enough water, would make out that they were being defrauded.
- 121. Q. If you had a storage reservoir?—Then I would give permission freely, and objections would seen ocase.
- 123. Q. Wuuld the people consent tu wet assessment?—Why not? It is the system they know.
- 123. Q. You have a system of village distribution?—
- 124. Q. Of which the village headmon is the controlling power !- Yes, the Patil.
- 125. Q. Supposing the Palit tries to get more than his shure?—He has his fixed chare, he can get no more.
- 120. Q. He cunnet get more than his share of irrigation, but could be not get more than his share of water?—1 should think perhaps sometimes.

- 127. Q. Have you had complaints of that sort?—Never Mr. Simeox.
- 128. Q. How is the distribution dens?—By the Huvil- 14 Dec. 01. dar ur Patkari.
- 129. Q. Does he attend the field to give enough water und then shut it uff?—Yss.
- 130. Q. Is there a regular time fixed f -No. When one field is irrigated he goes on to the next. He is not allowed to irrigate half a field and then go on.
- 131. Q. They trust his discretion as to when the water is to be terned uff P—The cultivator is generally present, ued it is done by experience. I think the system is a very fair one.
- 182. Q. Is there any royalty cherge fur water ?—Yes, for uccasional irrigation, according to the amount of land irrigated. The Mamlatdar sends out u man to assess it.
- 138. Q. Under what nutherity ?-The Land Revenue Code.
- 131 Q. Under the Land Revenue Code one you charge a rayalty ?—Yes; all running water is the property of Government. All heds of streams are also the property of Government.
- 136. Q. If a man takes water you charge him royalty?
  —Yos. It is called pankasar or water-rute.
- 136. Q. It is not a charge for water but fur increesed produce!—No. It is not for increesed produce, but for rrigation per acre.
- 197. Q. The water is the property of Government?-
- 138. Q. (The President.)—The mun is charged by the number of acres he irrigates?—Yes, at so much per acre.
- 139. Q. The assessment is for the udvantage of getting the weter?—Yes.
- 140. Q. (Mr. Higham.)—Is there a fixed scale of rates?—Yes.
  - 141. Q. It is not uniform P-No.
- 142. Q. [Mr. Jbbetson.]—Does it vary according to the locality or erop?—According to both.
- 143. Q. (Mr. Higham.)—Has the Irrigation Officer the right to close part of the irrigation under a bandhara P—No.
- 144. Q. Supposing the people quarrol, or take more than their shere?—There ere cases where urders are issued that u certain channel shall be closed for a number of deys in a week for the benefit of the next obannel below. These orders are based on old onstom, e.g., the Yuduer bandhara is allowed to take water for five days in the week, and for twu days it has to let the water run down to the Khaknudi bandhara.
- 165. Q. Are such orders disregarded in uny case ? -- Frequently, but I have generally been able to patch up the disputes, but few went to the Collector.
- 146. Q. Supposing they disoboyed your urders, could you shut uff the water ?—I don't know whether I chould have logel authority to do so.
  - 147. Q. You have never done so !-No.
- 148. Q. (Mr. Ibbetson.)—Have you outhority under the Land Revenue Code to settle disputes ubout the distribution of water between the different chunnels?—I don't know, we always managed it by friendly arrangement.
- 149. Q. You really settled such disputes by your influouce P-Yes.
- 150. Q. Huve you may legal authority to settle such disputes f—None that I know of.
- 151. Q. You were not able to settle them because you had certain powers, but because you had influence ever the people?—Yes.
- 152. Q. You suy the people are reasonable and therefore the system works well here abouts ?—Yes.
  - 153. Q. You propose to extend it to Sutara P-Yes.
- 154. Q. De you think the people of Satara will take tu it P-I coold not ear.
- 155. Q. (Mr. Muir-Mackenzie.)—I think there is some hope. The people in Javh taluku and down the Youa River are irrigating in this way?—Yee, on a very small scale.
- 15C. Q. (Mr. Ibbetson.)—In fugerat we were told that it is hopeless altogether to get the people to combine to clear unt small tonks. Is that the case in Setura?—I should think probably it would be the case if un attempt were made.

- Mr. Simcox. 167. Q. Do you think that there should be legislation in order to give the Collector or other Revenue officer authority 14 Dec 01. to settlo disputes and onforce the responsibility of silt olearance, etc.?—It might have to be done if the irrigation is much extended. It is not now necessary in this part of the country. I do not know how things would work in States.
  - 158. Q. Wers those bandharas made by the people themselves?—No body knows who made thom, they are very old.
  - 159. Q. In extending the system to Saturn, do you propose that the people themselves should make them?—I do not think so.
    - 160. Q. Will Government have to make them ?-Yes.
  - 161. Q. Looking at it purely as a commercial matter, do you think it would pay Government?—I believe it would.
  - 162. Q. The area irrigated would more than pay the interest on the cost?—Yes.
  - 163. Q. Would there be no working expecses?—Hardly uny. I do not think the district would need a separate irrigation establishment, the Executive Engineer would probably be able to work the system.
  - 164. Q. You say that in 1896 irrigation from bandharas was reduced Do you know in what proportion?—In 1896 I should say it was rather increased than decreased. In 1898 it may have been diminished by 25 per cent., so that only 3 of the normal area would be irrigated.
  - 165. Q. Not more ?-1 have no figures, but I should not think so.
  - 166. Q. (Mr. Muir-Mackenzie.)—Do the people in a famino year not change the choracter of their cultivation and grow fodder crops?—They do grow fodder in the hot weather, mostly konde a kind of juari. The hot weather orop is usually sugarcano, but that needs a grent deal of water more than is available in bad years.
  - 167. Q. Do they also grow rice, wheat, and gram?—Yes, in and after the rains
  - 168. Q. Do the Satara people appear to take any interest in the bandhure system ?— I was speaking only a day or two ago to an influential resident of Satara, who is now a candidats for the Legislative Conacil. He enggested that bandharas should be huilt on a co-operative system, and wondered whether, if private persons subscribed part of the capital, Government would produce the rest.
  - 169. Q. (The President.)—Is he a man of means ?—Yes, he is the leader of the local Bar, and it was evident to ms that he only spoke after discussing the subject with others.
  - 170. Q. (Mr. Ibbetson.)—In that case Government would only take a royalty on the water ?—No, system has been elaborated. I only mention the matter to shew that intelligent untives are taking an interest in the matter which apparently emounts even to a readiness to invest their money.
  - 171. Q. You say you have small tunks in the Malegaon charge for drinking, why should there not he larger tanks ?—There is one lorge Public Works Department tank on the Puscul River in the charge. It ran dry when it was most wanted in 1899, and no irrigation from it was possible,
  - 172. Q. If you have plenty of drinking tanks, why should you not have plenty of irrigation tanks?—There are one sites good enough.
  - 173. Q. There are sites for the one and not for the other?—Yes. The villoge tanks are made by damming up insignificant nollahs, and soon run dry.
  - 174. Q. Could rice be grown under them in the cold weather !-I think not.
  - 175. Q. It has never been tried?—No. In the case of the Dapurn Tank near the Khondesh frontier, which Mr. Ali Akbar and I saw, he agreed that ofter extonsive repairs and improvements it might be possible to irrigate a few sorces.
  - 176. Q. Is there any system of causes by which such tanks might be made assful?—No.
  - 177. Q. Were one possible, it would have been brought into use?—Probably.
  - 178. Q. You never suggested such a thing?—No. The country is all rocky moreloud or upland with very scauty rainfull. The village tanks are neefal for drinking and for getting a little head of water for wells below.

- 170. Q. There are wells then ?- Yes.
- 180. Q. What hoppened in the famins year?—Most of them dried up. There was not enough rain to fill the tanks, which dried earlier then usual. There were cases where whose villages emigrated on account of want of drinking water.
- 181. Q. (Mr. Rajaratna Mdlr.).-Cnu you tell us the urea these baudharas irrigute in each district or taluko ?—It varies much according to the soil, flow of water, and level of the land.
- 182. Q. What is your present area of irrigation? -I have no figures.
- 183. Q. When you were in charge, whot was the area irrigated ?- I would not say off-hand.
- 184. Q. Are the baudharas now irrigating n larger area than of old P—I think not. The whole as stem is very old and seems to have been worked to the full capacity of the mater from old times. The people have an instinctive sease of the possibilities of irrigation. I do not think they could irrigate more than they do. The instinct has become boreditary through many generations. They are elever oulties tors and their load is well farmed.
- 185. Q. If asw haadharas were built elsewhere, do you think the people would not combine and co-operate to keep them in repair?—If the system were to he tried in a new part of the country where it is not nadorstood, I should prefer that one or two bandhoms be made first as experiments, to see if the system would work.
- 186. Q. Would you substitute a small coss in lieu of a contribution for labour for potty repairs?—I could not say. A free hand as to details ought to be given in trying the system, or it ought not to be tried at all.
- 187. Q. Beferring to the Chandkapur scheme, would its construction interfere with existing bandharas?—Quite the reverse.
- 183. Q. The higher the water level, the further exten-
- 189. Q. (Mr. Muir-Maekenzie.)—I think Mr. Rajnratan asked you whether it would be preferable to substitute a small cess for a contribution for labour. Do you approve of such ucess in the existing bandhuras?—Nu, the present system is working well.
- 190. Q. (Mr. Rajaratna Mdlr.)—You cannot give the figures of revenue from existing bandlmas?—Not now. I could find them out, or Mr. Gabngau could give them.
- 191. Q. (Alr. Muir-Mackenzie.)—Do you consider that the present system of assessment by consolidated rate works on the whole satisfactorily ?—Yee.
- on the whole satisfactority r—1ee.

  192. Q. You would not like to eeo a orop-rate substituted?—No. The present system is good for people who pull together as these do. For instance, one man's land will be under sugarcane, which pays the best, a second's under rice, which pays moderately, and a third's under grum or wheat, which pays the least, necording to the rotation. Yet their circumstances seem all nike, and no doubt they have some system of pooling profits.
- 193. Q. (The President.)—Do they take equal shares.— They come to some friendly armngement.
- 194. Q. (Muir-Mackenzie.)—Do they lump all the oultivation together?—I should not go as for as that. These arrangements are never made public.
- 195. Q. (Mr. Higham.)—What is the proportion of dry land cultivated to irrigation !—Ten bighes of dry land to one of irrigation is supposed to be the ideal proportion—not often attained.
- 193. Q. (Mr. Muir-Mackenzic.)—Does rice pay as well as sugareane?—Not so well, but it is a paying crop.
- 197. Q. Do you know how the relative valoes are calculoted of the two for the purpose of assessing the rate. Is it half rate for rise, whole rate for sugarcane?—I do not know the exact proportion.
- 198. Q. Would it be 16 to 6?—I should think 16 to 10. Bagian rice is of very good quelity, I always used to get it sent to Satarn.
- 199. Q. What happons to the surplus water from bandhuras?—Down the nearest unliah to the river again. The people of Bagder, for instance, who live near such a nallah below the irrigation of Bej in Kolvan tsluka wish to dam this nallah and thereby establish a channel of their own.
- 200. Q. Is there subterraneous percolation below the limits of the irrigation ?- I believe usually.

- 201. Q. Were any wolls dag in such laud daring the famino?—Yes, several.
- 202. Q. Were they successful?—I helieve so. I know onto were so near the Satara irrigation.
- 203. Q. Do you think such sites for wells were chosen purposely P-No doubt.
- 204. Q. The multiplication of bandharas would then not only be useful for irrigation, but to keep up the level of the subsoil water ?—Yes.
- 205. Q. You were saying that some of the land irrigated is black soil?—The deepest black soil is at Kacasi.
- 200. Q. Coald you tell us how deep the soil actually is nd when muram is resched f—It is at least 6 feet deep, robably more. I have never seen it dug up doeper than 6 foot.
- 207. Q. Is it absolutely pitch black?—Yes, it is a rich soil. The minfall there is too heavy for cetton to be grown, but I imagine the soil is like the black cotton soil of Guiarat.
- 203. Q. Does black cotton soil require a great deal of water ?—I have not heard of its needing more than any other.
- 299. Q. What is the land at Satara ?—Black soil nearly 6 feet deep with muram at the bottom.
- 210. Q. We have been told that black cotton soil is unsuited for i.rigation P.-Such is not my experience.
- 211. Q. Do not people complain of the "sickness" of black cotton soil?—No. In Kaussi whore the soil is deepest, there has been no real trial. I montioued above that the village was only just being repopulated.
- 212. Q. You distributed a large amount of takavi in 1899-1900 ?—Yes.
- 213. Q. A groat deal of the distribution was done with your own hands f-1t was all done by my obeques.
- 214. Q. Were you impressed with the efficiency of the arrangement by which Assistant Collectors distributed taken personally?—Do you think it made the people mero ready to take advances?—I do not know. My reason for personal distribution was that one Mamlatdar works quicker than another. The quickest man, if left to himself, would get an unfall proportion of the grant for his taluka.
- 215 Q. Do you think that Assistant Collectors would have time for personal distribution in ordinary, times ?—Certainly, because then the demand is not large. In famine times it is right hard work. For instance, on one day at Malegaon I had between 1,000 and 1,200 persons present taken prititions to me.
- 216. Q. What is the cost of digging a well in the Malegaon charge?—For a well dug and built complete, I should say about Rs. 250 on an average.
- 217. Q. (Mr. Ibbetson)—Allowing for what depth of water in the well?—Ahout 8 feet.
- 218. Q. And the total depth of the well?-Ahout 30 or 40 feet.
- 219. Q. You include the building of the well?—Certainly-
- , 220. Q. (Mr. Muir-Mackenzie)—Did the building of wells during the famine lead to a larger area being irrigated ?—In 1896, yes—in 1899, ao, as the water was so low.
- 221. Q. Why so?—In 1896, though the rainfall was not timely, we had maore than the average.
- 222. Q. What is usually grown?-Wheat, gram, vegetables and fodder crops.

- 223. Q. Are the people keen about takavi ?—There is little Mr. Simeox. demand in Satara district, Lately, in the cold weather, I have been having a petition about once a week. This being the lit Dec. 01. well digging season, if there were any resl demand there would be hundreds of petitions.
- 224 Q. Do you think any alteration of the system will bring about any improvement !- No.
- 225. Q. It is no use lowering the interest? People do not mind the interest, they only object to the rigidity of the collection of instalments.
- 228. Q. Would it stimulate extension of takavi in ordinary times if the collection of instalments were made more clastic?—I don't think so.
- 227. Q. You do not think that would make them dig more wells?—No. If they want to dig wells in ordinary times they go to the Savkar.
- 228. Q. Doyou mean to say that if Government increase the facilities for getting mansy, the people cannot be induced to dig more wolls?—There is no harm in trying but I think not.
- 229. Q. (Mr. Ibbetson)—Is terracing done in your charge?—In Satara there are a great many terraces.
- k 230. Q. Do you think famine labour could be profitably employed on terracing ?—I had not thought of it, I should say famine labour might be so employed in hilly country.
- 231. Q. (The President)—You say that near Malegaon each village has its own bandhara?—Yes.
- 232. Q. Is there any village with two bandharas?— Very few. For iastance, at Arai there are two, one worked by Government and one by an landar. The water suffices for both.
- 233. Q. Is my bandhara the joint property of two villages ?-Very few.
- 234. Q. If a dispute open in a village, to whom do the disputants apply ?—I know of no rule. In one case they telegraphed to the Co.lector of Nasik.
- 235. Q. Does any appeal lie to the High Court ?-I could not say.
- 236. Q. (Mr. Ibbetson)—Could you tell us anything about the liability of the Satara district to famine and searoity?—About 60 miles from the Glats the land is very rocky and subject to drought. The taluka of Man is very subject to famine. But in the Glate near Mahabaleshwar there is always ample rainfall. The central part of the district is only partially subject to famine, if at all
- 237. Q. When you say the eastern part is subject to famine, you refer to the country hordering on Shelapar and Bijapur?—Yes.
- 238. Q. Doss that cover a considerable area ?-Yes, quite one-third of the district.
- 289. Q. The other two-thirds is secure?—Yes. A large portion user the Ghats ie taken up with forest.
- 240. Q. For bandhara irrigation you prefer a consolidated to n crop-rate P-Yes.
- 241. Q. You consider the former more advantageous ?—Yes.
- 242. Q. Why?—It is what the people are accustomed to, and they are always ready to pay it.
- 243. Q. If we made new bandharas, would there be some disappointment if we introduced a water assessment?—Yes. The people are thoroughly conservative, and would certainly raise quarrels over any new system for the first few years.

WITNESS NO. 42.-MR. E. G. GARAGAN, Executive Engineor, Khandesh Irrigation.

Answers to printed questions.

#### A .- GENEBAL.

- 1. The roplies refor to the Khandesh Irrigation District, of which district the writer has been in charge rather less than twelve mouths, during which time he has seen little of a large district, as he has had a very short tenring time, and his opportunities have unfortunitely not been such as to make him thereaghly acquainted with it in a short time.
  - 2. See Appendix I.
- 3. (1) Yes, in places, e.g., in the Upper Panjhra Subdivision the population by the last consus is about 50,000 and the area of culturable ground near £00,000 acres.
- (2) No.
- (8) No.
- (4) No. There is black cotton soil in a great many places, but on the whole the soil is very good.
- (5) No. Just lately the unfavourable mensores have had some effect, but ordinarily there is no reason why the quantity of water should be considered to be insufficient and tell against extension of irrigation.
- (6) No. The people are keen on irrigation and can generally find the capital necessary.
- (7) I have not very much knowledge of this, which is a question for the Revenuo Department, but from what I

Mr. Guhagan.

14 Dec. 01.

Mr. Gahagan. 14 Dsc. 01. can gather in sovoral parts given a certain sapply of water, the people (generally speaking) would not mind even a slight enhancement of assessment.

- (9) Thore is a chance if irrigation were increased that the price of labour would rise, this though is hardly a reason against extension of irrigation although it would increase the expenditure of the agriculturists.
- 5. Loans are not, as for as I am aware, taken for extension of irrigation from canals, but are freely taken (if the applicant een give the required security) for the perpess of well digging or deepening so as to extend cultivation under this form of irrigation.
- (4) If 1 thore is a failure to get water, there should be, I think, a total romission of the advance, but I would suggest Government using drilling or boring machinery to n far greater extent than at present to try and make sure of whother water is obtainable or not before actual well digging is attompted.
- 6. I should think not, md have never heard of such having happened. In this district there is a very strong desire, and a very general desire for extension of irrigation. The people are naturally agriculturists, and are very anxious for an increase.

#### B .- Canals of continuous flore.

- 7. (1) The system of irrigation in this district is the "Thal" system, that is, the whole "Thal" or "rallage land under cultivation" is divided into four "Phadis," each of which is cultivated in rotation with a different crop, e.g., one Phad has sugareane one yeer, the next has rice, the third wheat and the fourth, say, bajri, till and other crops. Next year the one that had sugareane will have rice, the rice plet will have wheat, and so on. Each of the sugarcane, wheat and rice crops can only give one harvest n year, but the fourth "Phad" gives two harvests yearly. So one-fourth the leud always gives two harvests.
- (2) The increase in the value of the crops is very considerable, as the value of crops grown is very much greater than it would be otherwise. If the more valuable crops, e.g., segarcane, wheat and rice were not grown, two harve-ts could be had in each Phad every year. This, however, would not pay so well.
- (3) (a) In a year of good rainfall rice and sugarcano would not give the same yield without causal water, as with, in fact, it is doubtful whether they would come to anything at all. Wheat and the other crops would probably be as well off in a good year without the canal as with it.
- (b) In a year of scanty rainfall the yield is considerably inorcased,
  - (c) The same, only more so.
- 8. A statement showing the comperison of net profit from the crops grown in an unirrigated field and nu irrigated field of one acre in area is attached. The yield of the former is given for one year only; and the yield of the latter for four years is taken into account, and an average for a year is struck. This shows that an irrigated field prodoces crops of the average value of Rs. 65, at an expense of Rs. 28, leaving the net profit of Rs. 65, at an expense of Rs. 28, leaving a net profit of Rs. 14 only. In ordinary years, therefore, an irrigated field of one acre pays three times the income of an universated field of one acre pays three times the income of an irrigated plot would give no yield whatever, whereas the cultivation of an irrigated plot would profit the owner at least Rs. 22, if not more. There is, how-

over, no reason why the value should not be more owing to the high prices of grain which then provail.

#### D .- Tanks.

23 to 33. It is prosumed from the questions under this head that small tanks, such as village tanks, otc., are meent. None of these exists io this district, so I can say nothing on these questions.

#### E .- Wells.

34. See Appendix II.

- 35. (1) Wells allow of two harvests being grown instead of one, one by moneoon and one by irrigation from the wells. This, of course, is provided, none of the high valued crops are grown, e.g., sugarcane and rice.
- (2) In this district higher rated orops are not grown under wells.
- (8) (a) In n year of ample rainfall wells are hardly if ever used.
- (b) In a year of scanty rainfall wells me very useful for supplementing irrigation from canals when canal water is short, and for sopplementing monsoon water by helping to water Jirayat crops.
- (c) In a year of drought if they have water (which they generally have, as they do not run dry till the next year), they are very usoful.
- 38. (1) Serious difficulty in selecting n spot for a well is not as a rule encountered in this district. The people consult their neighbours, and take into account the general nature of the surroundings, and are generally successful. They rarely if ever now call in the assistance of "water divinors," though I have known cases in which the aid of the latter was called in with very poor results for the man who paid.
- (2) In the actual construction of the well there is no difficulty.
- As far as I know no assistance has been offered by Government or Lecal Bodies in the shape of advice or use of boring tools, etc., in this district, although it has in others and I have myself tried them. I would strongly recommend the further use of boring tools which should be supervised by experienced men, and a small charge made when a spot with water was found.
- 30, I do not think Government should build wolls in private property. The people are just as well able to do it for themselves, and as they would not have the heavy establishment charges to incur which in Government work so udds to the cost, they would get it done cheaper. Their work would not have the finish that Government moght to advance the money, after finding a spot by boring, mid then let the owner work the rest in his own way. In addition, if Government built the wells, they would want some return either in a lump sum or as a yearly rental, and the cultivators would not care to be bound down to anything like this, as they could never be certain of a supply of water, nor of the means of lifting it as they are never very vertain of what their couldition will be in future years, nor whether they would even require the water, if the resinful should be exceptionally good.
- 40. Temporary wells are very rarely used in this district, nor does it appear necessary to one our ago their construction. I have little knowledge of them myself, but from information gathered from many sources this is what I learn.

- 1. Q. (The President)—You are Executive Engineer of the Khandesh Division P.—Yes.
- 2. Q. You are in charge of the district of Khandesh ?— Yes, of Khandesh, and Bagha Division of the Nasik district. There are four taluks in my charge.
- 3. Q. I suppose your chief irrigotion works are ban-dharas ?-Yes.
- 4. Q. How long hove you been in this Division?-Not quite 12 menths.
- 5. Q. Where were you before !- I was in the Secretariat in Bombay; before that I was in Satara.
- 6. Q. (Mr. Mnir-Mackenzic)—Were you not in Nasik?
  —Yes; I was there five years age. I was in Satara for o couple of years before I come hero.
- 7. Q. (The President)—How long were you in Nasik?—About two years, but I did not see much of the district; I was on the Godavery Bridge.
- 8. Q. Do you know of any sites for tanks in the Khaudesh district?—Yes, I reported on a site and recommended that a tank ought to be built as seen as possible.
- P. Q. How far is the Public Works Department responsible for the repair of bandharas?—Only when they get into a very bad state, and become practically useless, we then prepare the estimates and do what is necessary.
- 10. Q. What is done in the case of petty repairs ?- The villagers look after that. They generally let them get pretty bad before repairing them.
- 11. Q. You have no separate establishment to supervise the work?—No, our establishment has a tremendens lot to do and cannot see to everything, and when our attention is called to the want of repairs we attend to them at once.
- 12. Q. Do you visit the bandharas periodically?—I have not visited all, but in the short time I have been here, I have inspected a large number.
- 13. Q. I suppose if you notice anything wrong you call upon the people to make the accessary repairs?—Yes; if anything wants putting right or needs clearing I call upon them to do it.
- 14. Q. They are responsible for such repairs, but do they generally carry them out f-Ves; they have done so up to the present.
- 15. Q. Here you never heard of them refusing to do it?—I have heard they neglect to do so semetimes, but that is not my experience.
- 16. Q. Generally speaking, as far as your experience goes, do you think that the system works very well?—Yes, very well indeed.
- 17. Q. As to the distribution of water, how does your system work?—In a bad year it does not work well; the rillagers economize water in their own villages.
- 18. Q. In ordinory years, about whot proportion of the whole land is irrigated? Is half irrigated?—I should think so.
- 10. Q. In a bad year when weter is scarce, presumably prices are high?—Yes.
- 20. Q. Would the villagers in such times not cultivate more extensively by ploughing up the fallow hands?—I have never seen them do it.
- 21. Q. With the inducement of obtaining higher prices for their predoce would they not extend Irrigation?—No; because they are not sure that there will be sufficient water to extend their irrigation. If they were perfectly certain that there wend be a good supply of water, they would extend it.
- 22. Q. They would not risk it !-- No; they are very keen but cautious.
- 23. Q. The wasto water goes back into the river ?—Yes. The overflow goes back to the river and is taken up further down by another bandhara.
- 24. Q. What do you think ought to be done to stop the people from wasting water?—I sheald propose that the Land Rovenae Dopartment should have legal authority to control the water-supply. For instance, in a year of drought, we cannot stop the water when we like. If people choose to toke water we cannot prevent them.
- 25. Q. (Mr. Mair-Mackensie)—I suppose you do prevent them?—There is no law to support us in doing so. If the people in a village are obstroperous we cannot cut off the river supply. The Irrigation Act and the Canal Act do not apply to the second class irrigation works.

- 26. Q. What are second class irrigation works?—These that pay consolidated revenue.
- 27. Q. (The President) —Suppose you say to the villagers "you will get water for se many acres; you shall not have any mero," would they question your legal power?—No; they would agree.
- 23. Q. You told us this merning about eight of your bandharas. Is there ony water left in them ofter the monsoons?—Yes; in ordinary times when the river flows.
- 20. Q. The Makti tank reservoir is new dry?—Yes entirely; the river supply has failed practically; we have no water-supply in the river.
- 30. Q. You have practically only tank irrigotion new? Yes, the Panjhra fails, but the Girna goes on always.
  - 31. Q. Does the tank take canol water only ?-Yes.
  - 32. Q. And the Panjhra? -No.
- 33. Q. How long has the tonk been in existence?—For the last 20 years I think, but I den't knew exactly how long.
- 34. Q. Is the Mukti a large tank?-No, it is rather a small tank.
- 35. Q. How long does the water last?-With a little economy the water lasts till the next mensoon.
- 36. Q. (Mr. Muir-Mackenzie)—Was it not etated in correspondence that the Executive Engiager had power to control the water supply?—No; we cannot stop the river water supply.
- 37. Q. (The President)—Have you seen these eight bandharas?—No; I have seen only three of them.
- SS. Q. De you know the country well enough to say whether if a tank twice or four times the size of the Mukti were huilt it would be possible to extend irrigation ?—Yes, I have been told it would be. We have positions to extend it.
- SO. Q. Do you know anything of the tank projects in the Ghats f-One or two only. There is the Punpara which is about half finished.
- 40. Q. Could your bandhara system he extended to irrigote a greater area t han at present untored?—Yes, if there was a storage reservoir.
- 41. Q. Do you think you would then require a more claberate system of supervision and distribution?—I do not think so; I think the people could manage it fairly well themselves; they manage it now perfectly. There must, however, be some authority which could interfere if they marked the water; etherwise I would suggest that it be jeft to them.
- 42. Q. De yeu think the channels should be enlarged? No; I do not think any villege could extend its irrigation sufficiently to require an enlargement of the channel for the present.
- 43. Q. Bat beyond the vilinges ?—At present we have fon cuble feet of water; I don't think irrigation can be extended two or three times more than it is at present. All the capels really run ulong the village bonk.
- 41. Q. Whot is the area irrigated on this district?—About 12,000 acres and in Nasik about 25,000 acres; that is, under the bandharas. If they are extended I do not know if the present channel would be big enough; but the bandharas would bring more villages ander cultivation.
- 45. Q. The present bandharas and the present channels could be enlarged to enable the water to pass to another village?—I think squabbles would take place if one channel had to serve two villages. It is better to allow o channel for each village.
- 40. Q. It would be mere expensive?—Yes; we should make new consis and carry thom through more than one village.
- 47. Q. You have told us about the Chandkapur tank?—Yes; it is in the aerth-west part of Malegaon.
- 49. Q. You say "the irrigable area is 10,445 acres "?-Yes.
- 49. Q. There is to be a big banthara on the left bank?
  -Yes.
- 50. Q. Has that not been bailt up yot?—No; it is a part of the Chandkapur project.
- 51. Q. I believe that the earthwork of the left bank is finished?—Yes; the canal and the bandhara are finished; but none of the mesonry work has been done.
- 62. Q. Do you know at what stage the project is just now?—It is either before the Government of Bembay or the Government of India. It left my hands long age.

Mr. Gohagon.

14 Dec. 01.

Mr. Gahagan. 14 Dec. 01.

- 58. Q. You say some work was done on it during tho fumine P—Yes; it was storted some thing like 25 years ugo; Rs. 70,000 or Rs. 80,000 were spent on it. The masonry dam could not be done by famine labour.
  - 54. Q. There is to be a masonry dam ?-Yes.
- 55. Q. How high?—About 85 feet; some objections were raised to the height.
- [Mr. Highm explained that the objection raised by the Government of India was as to whother the estimate of revenue likely to accrue was not based on over senguine
- 56. Q. It is an old project?—Yes a very old project which is blocking the way of others. If the tank wore completed we could construct more bandharas.
- 57. Q. Was it on the mean or the minimum minfall that Mr. Tate calculated the project?-On the mean rainfull over several years.
- 58. Q. There is a good Ghat catchment where there is pleuty of water and so there will be no doubt about the tank filling?—No; it will fill.
- 59. Q. What is the most important project in year Division just now?—The Purmapada tank; there are also same athers. The Purmapada is nearly half finished. There is the Munad and also two others which we have condemued because the foundations are too deep.
- 60. Q. Where is the Purmapada tank?-It is about 15 miles from here; it is on the road to Malegaon.
- 61. Q. Are there any baudharas down there f-No. The water will have to be taken 37 miles down river before it starts irrigating. The point is whether the water will go down to that distunce.
- 62. Q. Has the project game to Government for same-on?-It is half finished. The dam is bullt, excepling tion ?the closing gates.
- 63. Q. Why was the work stopped?—It was a famine work which stopped with the famine.
- Gi. Q. It is not being carried on as an ordinary work? -No.
- 65. Q. The estimate is Rs. 2,60,000?-Yes.
- 66. Q. The whole estimate is Rs. 4, 10,600 P-Yes.
- 67. Q. It is an expensive work ?-Yes.
- 63. Q. (Mr. Higham)—The two lakks of famine work done does not represent the value of the whole work done f —No, not by one-third.
- 69. Q. (The President)—Do you consider that the work is one which ought to be completed f—Yes, Government may think it can walt for another famine, but it would take 3 or 4 famines to finish it.
- 70. Q. (Mr. Higham)—When was the work stopped?—No work has been done since last December. The work was stopped last Christmas; there are u let of works like that in this district. The famine stopped and the works slopped.
- 71. Q. The other works I suppose are of no particular since?-No, they were morely taken up to give the people employment.
- 72. Q. Are there any other tanks !- There is the Manad 72. Q. Are there any other trains:—There is the Manau which was designed to supply the Jambeda cannl; that is an important tank; the objection to it is its creat depth; they have gone about 50 feet and they canaat get foundations. This tank is very important as the Jamda canal does not do what it was intended to do. It was constructed to supply water for sugarcanc. The tank is bully wanted and the site selected is the only one possible.
- 73. Q. What about the Dudhala tank?—Nothing has been done to it except that it has been looked at.
- 74. Q. Have you u list of works for which the estimates have been completed ?-I have not get one; perhaps Mr. Beale has.
  - (Mr. Beale)-The list is given in my report.
- 75. Q. (The President)-With this list to fall tack on yen would have no difficulty about a programme of velicit works. You could turn the people out on them at once?—Yea, in my port of the district; I have plenty of projects ready.
- 70. Q. (Mr. Higham) What are the limits of your large? Tho wholo of Khandesh and the Molegnon Division of Nasik.
- 77. Q. You have many bandharas in your district. What is the total uren they irrigate?—About 20,000 acres.
- 78. Q. I don't think the Jamboda canal is included ?-It is not included in the bandhara system; it is a separate

- 79. Q. How many bandharas have you got ?-We have 182 bandharas in both districts.
- 80. Q. How much land does the Jumdu canel irrigate? -It irrigates about 5,000 neres.
  - 81. Q. Have you any other cannis !- No.
- 82. Q. The total irrigation in your Division is about under 50,000 acres ?—About 120,000 acres in all; 37,000 from bandharas; 5,000 from the Jamda canal; and the rest from the large Government tanks.
- 83. Q. They don't feed the bandharas ?- No, they irrigate direct.
- 81. Q. (The President)—The Jamea canal has a band-hara ?—Yes,
- 85. Q. When are you going to finish the tanks?-I don't know.
- 86. Q. Would you keep the Cuenkapur back?—It has not been sauctioned yet.
- 87. Q. Do you know at what slage the project is ?-The project came here nine or ten months ago and was sent back, and we have heard no more about it.
- · 83. Q. Was anything done to it during the last fumine f
  —Very little I believe; I was not here. I think very little
  indeed has been done to it since the 1897 famice.
- SO. Q. What about the Purmupeda?—It was stopped when the famine was over.
- 90. Q. Have you any estimates for repairs?—Yes, they are ready, but have not been sanctioned.
- 91. Q. What about the Raipur?—Practically nothing has been done to it. I have received a petition ugoinst it.
- 92. Q Have you gone into the points of the petilion? No, I only got it yesterday.
- 93. Q. (Mr. Hiokam)—Are there any schemes for building additional bandharas?—There are several. Two are now being made.
- 91. Q. Will you take them up as a second class work?—No. I think they should be taken up as first class works.
- 95. Q. Would you keep a capital account for them?
  -No. They only cost about Rs. 5,000 each.
- 96. Q. Would you charge consolidated ratef-No; but if people ask for it, it will probably be granted.
- 97. Q. Could you make them uithout a storage reservoir?—Yes. We could make them on ulmost every river exe pt the Tuptl, but they would all be the better for storage reservoirs. Those we are now working are on perennial streams and don't want reservoirs. There is room for more of these on the Glana and Mosam.
- PS. Q. You say it would be a great advantage to make borings for wells; is anything like that done?—Not here; I did some in Situra.
- 93. Q. Who did it; the Public Works Department? -Yeu,
- 10). Q. Here you a set of bering tools?-Yes, we have three sets; we lend the machiners to the Manlatdara; they
- 101. Q. How did they work ?- I don't know; I left the district about that time.
- 102. Q. Did you find a good water tsupply?-Yes, in
- one place; that is all the experience I have.

  103. Q. Do the people make applications for the loan of these tools?—I had three or four.
  - 101 Q You charge a nominal rate?-Yes, Rs. 5.
- 105. Q. Did you make any boring for the people and charge them?—No, never; we have not done that for any-
  - 105. Q. In this district it has never been done?-No.
  - 107. Q. Would it be useful?-Yes; it might be useful.
- 108. Q. (Mr. Ibbetson)-You say that 87,000 acres are irrigated; what would be the cost of o-tablishment per acre irrigated; what would be the cost of o-tablishment per acre irrigated from a bandhorn?—I could not say.
- 109. Q. What is the cost of total establishment?-I could not tell: I can get the figures to-morrow.
- 110. Q. You have no new Landharas made which are new worked by Government !- No. . Wo are building two."
- 111. Q. Do you think they will pay?-Certainly.
- 112. Q. There is no doubt about that ?-No."
- 113. Q. On perennial streams !- Yes, or any stream with a reservoir.
- 114. Q. In order to centrel the distribution of water do" you think that legislation is necessary to give you proper

Mr.

power to the Public Works Department or the Revenue Department.

115. Q. Did you have any trouble in getting the psoplo to do their own share of the work?—No.

116. Q. Do you think that legislation is necessary in regard to repairs also ?—I do not think so because I think the present Act covers it.

117. Q. You have power already ?-Yes. .

118. Q. Sapposo you have not?—Then it might be accessary. I think we could make them do that.

119. Q. You say first closs works pay water rates and the second class a consolidated rate?—They are called second class works simply for purposes of accounts.

120. Q. (The President)—Tho new tanks would be first class works?—Yes.

121. Q. The bering tools you have in Satara are for trul borings?-Yes, they are about 3 inches in diameter.

122. Q. You say any tank would be popular?-Yes.

123. Q. There is no irrigation tank in this district P-I am speaking of village tanks.

124. Q. Would they be popular !- There are some which are disused.

125. Q. Do you think there are sites on which small tanks could be constructed?—Yes, last week while out in camp in three days I found two good sites.

128. Q. Do you think there are plouty of sites?—Yes; as a matter of fact 50 sites are listed now; they could be surveyed.

127. Q. No general examination has been made !- No, and it is a very big list.

128. Q. You had to omploy famine labour during the last two years; why was nothing done towards making these

Paragraph II-

small tanks. Do you think that people would use these tanks ?—I think that they would.

Gahagan. 129. Q. For what crops?—Generally for sugaroane, be- 14 Dec. 01. cause it pays best. They got something like Rs. 100 noro of prefit on sugarcane.

130. Q. You say small irrigating onnals would not give sufficient supply P.—No; you could not irrigate sugaroan from them.

131. Q. Is there rice irrigotion in this district?—Yes, in the Nosik Division. It is about the best rice grown. I am sorry to say that there was very little this year.

182. Q. Tanks would be valuable for that ?- Yes.

133. Q. None exist at present?-I do not know whather small tanks would be useful unless they had wells under

134. Q. Would not they halp the rice if the rain failed?
-Yos. In some parts for the last mouth or se people have been using small tanks.

135. Q. Do you know any reason why tanks should not be successful?—I believe the only reason is want of water There is no other objection to tanks.

136. Q You say that in this district dry red crops don't grow under wells !—The people generally grow bajri; they don't grow sugarcane or rice.

137. Q. What aren is irrigated per kos ?-Between 4 and 5 acres with double bullocks.

138. Q. You say in a your of drought if they get water it would be very useful?—Yos.

189. Q Do you know what happened to the wells during the last four or five bod years?—I was told they generally failed.

140. Q. Did they fail in 1898 ?- No.

141. Q. In what stats are they now?—They are all dry, not a single well has a foot of water in it.

### WITNESS No. 43.-"Mr. MAHADEO CHINTAMAN KELKAB, Mamlatdar of Pimpolper.

The soil in this talaka is generally of poor quality, whitish in color and recombles the Mal land of the Decean, There are some small tracts of rich soil of blackish colour in the western parts of the taluka. It differs from the very rich black soil of Eastern Decean in being much less sticky. However, it appears to be most fitted for the irrigation purposes of 280,000 acres shown under (b) being cloud 10,000 acres and dependent as a tifficial from above, about 10,000 acres are dependent on artificial friga-tion. The dry crops of bajri, cotton and kulthi are no

way dependent on artificial irrigation. But the remaining Mr. Kelkar principal crops of the taluku, viz., sugarcano, rice and wheat, are solely dependent on it. 14 Doc. 01.

Rainfall.—It is not equally distributed all over the taluka. On the eastern plains it comes to about 15 to 25 inches, while on the western hillsides and the Ghats it goes up to even 50 inches. The average rainfall at Sakri during the last 10 years was 20 inches and 60 cents. In this taluka even during the south-west measons there is ordinarily a detained on the interesting rates. is ordinatily a demand on the irrigation waters so far as the crops of sugarcane and rice are concerned. During the breaks in those mouseens these crops regults watering.

I give below the irrigated crops of the Italaka and the number of waterings they genorally require for giving a normal vield :-

Crop.	Number of waterings required for complete growth.	The time of the year during which watering is required.					
Sugarcano	25 to 30	The whole year.					
Rico*	25 to 15	6 months, June to Octo-					
Chillies	12 to 15	8 months, June to Janu-					
Wheat	3 to 4	4 months, Novomber to February.					
Gmm	2	Do. do.					
Pea, etc	2 3	8 months, November to					
Sweet potatoes	10 to 12	4 months, at any time.					
Ground-nut .	8 to 10	6 months, January to November.					

\* The best thing for rice would be to have water always flowing to tholand for the first 4 moulds.

Sugareans and rice are grown only in Thal lands, irrisgated by water from unevery bandharas, i.e., weirs constructed for the purpose of raising the level of the flowing water seroes the three rivers of Panjra, Kan and Burai and not in fields irrigated by well-water. The next four crops are also grown chiefly in the Thal lands as above, but they are also grown on well-irrigation, chiefly in villages having

Mr. Kelkar, got no river bandharas. In the Thal lande the distribu-

got no fiver banakaras. In the Thai inner the distribu-tion of irrigating woter is controlled by dividing the whole Thal area ioto four suitable parts called Phad, one of which is given to sugarcace, one to rice and two are left for the rest. The crops are token by rotation over the whole area as 1 rice, 2 sagarcone, 3 wheat, 4 gram, etc., ogain, 1 rice, 2 etc. In the case of well-irrigation the distribution deneds on the will of the owner. distribution depends on the will of the owner.

In this talnka irrigation rovenno is not realized as a separate water-rate or tax on the orop raised as in the case of first class irrigation, but as an amalgamented Knyam Bagayt-rate fixed by Survey Officers at the time of cettlement, taking into concideration the quality of the seil and the strength of the water apply in the bandhara to raise particular crops. It ranges from Rs. 3 to Rs. 15 per acre.

Paragraph III.—In this tolukn cotton is not generally sown in rich block soil but in poor soil. No tanks for irrigation purposes have been constructed in black soil in the taluka. Even in the black soil Thals there is domand for water in sessons of average rainfall and much more so in times of prolonged drought. The crops raised in such soil require to he watered oven in years of average rainfalls. In this taluka the irrigated area is fixed once for all at the time of the survey settlement and assessed at Kayam Bagant rates, and honce there is no scope for a falling off or time of the survey settlement and assessed at Kayam Bagayt ratee, and honce there is no scope for a falling oil or an increece in the irrigated area as in the case of first class irrigation. People in this talink are for a long time accustomed to irrigation and the advantages thereof, and so have been always anxious to increase the irrigation if it he possible. They know that the richer the soil the greater the profit, and so the villagers having each suitable soil in the three river valleys of the talinks are desirous of getting an opportunity for securing new or extending old irrigation. Consequently the construction of storage tanks on the three rivers to increase their pricating water supply is predicted. rivers to increase their arrigating water supply is mwaited with great lenging. There is no scope in this taluka for construction of small tanks for such or other soil either by private or hy Governmoot onterprize.

Paragraphs IV and VI.—There are no Government irrigation works as such so far os I understand the term. Irrigation works constructed and maintained at Government cost, from which water is given to intending irrigatornof londs within the reach of the obnancis on payment of fixed water-rates for particular crops by the Irrigation Department, can only be termed Government irrigation works. This irrigation, I think, is called first class irrigation. As

I have once meetioned above, irrigation works in this taluka consist of masonry bankharas or weirs obout 4 to 6 feet in height, constructed ocross the rivers of the Panjara, Kanheight, constructed ocross the rivers of the Panjara, Kanheight, to raise the level of water therein and snitable chaonels and sub-channels emanating therefrom ranging in length from I to 6 miles for irrigoting lond in one or two adjacent villages. These works have been constructed more than a century before by the villages concerned at their own cost. The work of further repairs and mointenence of these works appear to have been handed over or taken up by Government, perhaps at the time of settlement, in consideration of the large amount of revenue collected thereon, and the system is termed second class irrigation. The original enstoms and rights of the irrigators are, however, and the system is termed second class irrigation. The original enstoms and rights of the irrigators are, however, kept up intact and are very rarely interfered with. The control over the water generally is supposed to be in the hands of the village Patil, assisted by some menial servante of the village irrigators, called the Patkari and Hawaldar. The work of making petty repairs to and the cleaning of channels is generolly done by the irrigators tagether. So in fact it can be said that the distribution is really controlled by the irrigators in general, and this always gives room for high-hondedness of the Patils or big lond-holders and petty complaints to the Revonao authorities who are supposed to have general control over them. If we leave aside the factor of Government taking op the repairs and maintonaace of works, these irrigation works can be oppropriately termed village works referred to in paragraph VI. But from the above description it can be said that the irrigation works of the toloka are partly Government and partly village works. the toloka are partly Government and partly village works. In addition to these principal works there are a few villages in which some people pat up every year small kacheho are katmati temporary bandharas on nallahs or tribotaries of the rivers at their own expense, and raise minor irrigated crops of wheat, gram and pea. Hence I am going to answer both the points together.

The Irrigation in the talukn is chiefly dependent on the water supply in the three rivers mentioned above. These rivers ore small rivers toking their source in the western hills in the taluka, the northernmost branches of the Sahjadri Mountoin. Their water has been arrosted and utilized wherever possible by almost every village from the source to the mouth of each river. Consequently the irrigation in every village is solely dependent on the strength of the flow of the river water during whole of the year round. The statistice shawing the irrigating capacity and range of variation of these irrigation works are given below:—

No.	Name of River.		Name of River.		Name of Rive		Name of River.		Name of River.		Name of River.		Name of River.		Name of River.		Name of River.		Name of River.		Name of River.		Name of River. These bandharas being simple weirs to raise the level of These bandharas being simple weirs to rules the level of water have an holding capacity, and so enanot be depended on in years of drought. About six bandharas on the Panjaro and only two on the Eurai could be depended on during the last two years which were of dro-ght. On the Panjara there is comparatively a larger area of catchment and on both of them there are good perennial springs in a few places; consequently it is becoming essentially necessary to have atomore tanks on these three rivers, which, if conto have storage tanks on these three rivers, which, if constructed, will highly increase the protective volue of these works. As for the kachehu temporary bandharas (B) I may say that they cannot be depended on in a year of drought. Besides these thore are no other possible sources of irrigation. I do not know whether there has been any law passed or executive order promplested at the source wettlement. or executive order promulgated at the survey sattlement in

which the responsibilities of Government in connection with the maintenance and repairs of these bandharas have been fixed. But as for a appears from the Government records, I think the irrigated land under these bandharas has been generally assessed at increased Kayam Bagayt rates ranging from Re. 3 to 15 per acre at the time of original survey settlement, and in consideration of the large increase in the Land Revenue thereby effected Government have undertaken the naintenance and repairs to the bandharas and the main channels leading water to the village lands. For this purpose these works have been put in charge of the Irrigation Department and they construct necessary new works and execute repairs to these according to the requirements of the irrigators and the funds made available for the purpose. In this taluks about Ré. 48,000 are realised every which the responsibilities of Government in connection with

year by Government as Land Revenue from the Kayam Bagait, and on an average Rs. 9,000 are annually spent through the Irrigation Department, from whose records of these places I have gut this figure. Last year only a special famine grant of Rs. 1,070 was expended on the silt clearance of the channels on the Kan River. In the case of the kacheba bandharas no responsibility whotever rests on Government, and only a temporary water-rate on the area actually irrigated is essessed and levied by the Revenne Department as royalty on the water. This water-rate is extra for the year only and ranges from Re. 1 to Rs. 4 according to the strength of water-supply and the probable expenses incurred by the irrigators on the work.

This Kayam Bagait assessement on the irrigated lands forms part of the Land Revenue and is collected at the respective Land Revenue instalments. Its collection is not idensedent on the raising of particular crops or the less or

This Kayam Bagait assessment on the irrigated lands forms part of the Land Revenue and is collected at the respective Land Revenue instalments. Its collection is not dependent on the raising of particular crops or the less or greater supply of water from the bandharas; consequently no general remissions whatever are granted to these irrigators even if the water-supply fails portially or completely. As a consequence of this system during the last two years all the Knyam Bagait assessment was to be recovered from the well-to-do or better class peaple, oven if they could not get any or full value irrigated crops in their land. Only in the case of poorer agriculturists special famice remissions have either been granted or praposed along with other cultivaters having no irrigated lands with them. This has worked very hard upon the irrigators (specially on the Kan River) who had to pay in the midst of famine difficulties Kayam Bagait essessment at Rs. 3 to 15 for water and orops, for which, instly speaking, they should have paid much less.

Those bandharas are generally strongly built, and consequently there is very little chance of those works going out of order altogether. However, on such occasion arising, when owing to some great and accidental damage done to the bandhara or to the main channel irrigotion of the lands concerned becomes impossible, Government do not become altercilessly exacting, but on proper inquiry give general remission of the irrigation share in the Kayam Bagnit rates and recover only Jirait rates on the lands concerned. There are precedents for this statement in the case of Bhadone and Daterti bandharas. New works resembling these pakka bandharas do not appear to bare been constructed anywhore in the taluka by the people at their cost or by Government during the last 25 years or so.

bandhards do not appear to bayo been constructed anywhoro in the taluka by the people at their cost or by Government during the last 25 years or so.

I think the protective value of these works can be increased by devoting more money and great attention to their up-keep and improvement, and by constructing of hig storage tanks on the three rivers. I may illustrate this with the following observations:—

- (a) The main irrigation channels leading water from the bandharas to the lands generally got silted and at times to a very large extent, thereby annsing much obstruction to the flow of water. Consequently clearance becomes often necessary.
- (b) The bandharas also get silted if the scouring sluices are not timely opened at the time of floods. The irrigators are expected to do these works. However, in practice, unless there is a laudable unmimity about these things emeng the irrigators, which is rarely the case, these works are often neglected, being the husiness of ull or nobody. This work, if done by Government Irrigation Department at regular intervals, will not cost much to Government, but will bring much good to the irrigators and so enhance the protective value of the works. There is very little scope for encouraging lond-owners by suitable loans, etc., to construct any more new works in the talaka. In my opinion the protective value of the present works can only be increased and to a very large extent by the construction of storage tanks on the three rivers of the talaka. I would particularly arge out the necessity of taking up of the storage tank on the Kan River, as the irrigators thereon have already suffered much during the late years and particularly in the famine; and until that work is executed I would recommend general remissions being granted to these irrigators at certain fixed percentage, teking into consideration the particular circumstances of each bandhara concerned. If the three storage tanks are constructed, there will be scope for increasing the irrigation over an additional area of about 1,000 acres. The present irrigation works in this taluka do not serve any purpose concerning village water-sapply for men and cattle.

Paragraph V .- I have nothing to say with regard to Mr. Kelkar this point.

ŀ	Paragraph VII.—	1-44	14 Dec. 01
	Approximate area irrigated by wells in ordinary years	1,200	-
	Approximate area irrigated   1899-1900 by wells in years of	1,800	
	drought 1900-1901	1,600	

I am nuable to say how many now wells were coastructed annually during the last ten years. However, from what statistics I have collected I can give the following information:—

Total number	of a	grienlt	nral	wells	in	tho	
taluka	•	•		•			800
(i) Numbe							250
(2) Numbe	r of w	ells in	not un	1 150			550
(3) of (2) 'or rep	The no	mber o	of wel	lls cons	truc Tı	ted	
loons			,			.6	00

Under the present rules of Tagai advances no concessions are allowed to canstructors of new wells. I think it is possible and also desirable to stimulate the construction of new wells by more liberal advances or other inducements. In this cannettion I may point out that the existence of wells and irrigation thereon form a great protection to the enlitirators in times of famine. If there is one good well in a village in famine times, it heames a reody means for four or more families to join together and maintain themselves. This has been noticed by me during the famines of 1896-97 and 1899-1900. In this tainkn too the same was the case. From the figures that I have given above it can be seen that during the last two years obout half as much more area was irrigated on wells than in a normal year. This tainka has got only 42 villages that are protected by river irrigation works.

There are 34 that ore partially protected by well irrigation. The remaining 90 villages have got no irrigation protection at all. In the case of the last two batches of villages there is still much scope for increasing well-irrigation, and from what I have seen of the people during the last two years-and-a-half I can confidently say that the people have an aplitade for well-irrigation end can with advantage he indaced to take to it. But under the present system of Tegai advances it becomes rather difficult to push on the system, as the cultivators in these villages are generally poorer classes and bave not sufficient security to offer or are not in a position to hear the inevitable results of a failure in the work. Under the circumstances I believe that a more liberal cystem of Tagai advances, in which remission of interest and partial or total remission of the advance in case of failure of attempt to obtain water would he passible, will stimulate the construction of new wells and increased well-irrigation.

Though there has been so increase in the irrigated area or welle during the lest two years, still I think that the supply of water in wells is affected to some extent by the drongbt during the period, and during the current year the affection has been very mash as a result of the previous scarcity of rain. Some of the wells that had become dry were deepened with good results. No statistics as to how many failed entirely or were abandoned is available; still from my observation I may say that such instances were rare. In this taluka one has generally to go down about 20 to 30 feet from the surface of the earth before he can top water, and the construction of an average well ready for irrigation costs about Rs. 150 to Rs. 200. Such a well serves an average area of 4 acres.

Paragraph VIII.—In this talaka instances of lands or crops being injured by water-logging or excess of water even in very wet years are not known. I have noticed as droinage works here, and I do not think any are required on any grounds.

Paragraph IX.—During the last famine no relief labour was employed in this taluka, which was seriously affected, on only irrigation works. It was chiefly employed on metal-brenking for Local Fund and Provincial roads and construction of new roads. The Ghorda-Chinchpada Road was taken up and left nnfinished. Some small works in Government forests were also andertaken as far as I know. I am onablo to say how much measey was spent on the first two works. Last year about Rs. 800 were spent on the first two works. Last year about Rs. 800 were spent on clearing of silt from two village tanks useful for mon

Mr. Kelkur. and cattle only, and as n consequence they have become more neeful. I think it is desirable to complete the construction of the Ghorda-Chinchpada Road, as it forms part of the Prorincial Trunk-road from Dhulia to Sarat and also will be neeful as a road facilitating communication from Pimpalner, the most important commercial town of the taluka, to the Chinchpada Station on the Tapti Valley Railway.

> Paragraphs XII and XIII .- The etatistics and tho Information referred to in these paragraphs relate to first olses irrigation, and so are not available here.

Paragraph XIV.—As for the protective value of the cxisting second class irrigation works in the taluka, I have made some observations in numbering soms of the previous paragraphs. I have, however, to say something on the points referred to in this paragraph. From my inquiry in the taluka I learn that the protective value of those works was best exemplified during the famine of 1896-97. During the early period of the mensoons of 1896 nn abnormally high rainfall was experienced in this taloka, and that had the result of keeping up a good supply of water in the bandharas to n maximum strength. This gave the irrigatous an excellent rabi harvest and afforded a very large field for agricultural labour to the irrigated mill mon-irrigated villages in their vicinity as well. Generally overy normal year the harvest of sugarcane-pressing and wheat-reaping affords much labour. Under the circumstances, though all the non-irrigated kharif villages had to face a scarcity of grain and labour that year, still the irrigated villages heing much botter off inforded a great protection to these villages also. While during the last famine the irrigated villages having suffered for want of water in the rivers excepted. irrigated villages having suffered for want of water in the rivers concerned, the scales were turned and the talnka as a rivere concerned, the scales were turned and the talinka & a whole had to undergo a very serious distress. Relief works, poor-houses, kitchons, and extensive dole lists had to be opened, and very largo amounts from tagai and Indian Charitable Funds had to be advanced for infording relief to the people during the year 1899-1900, while very little in the sort had to be done during 1896-97. I am, however, not in a position to say to what extent the cost of famine relief would have been increased if these works had not hear in contration. been in operation.

#### A .- GENERAL.

- 1. These answers refer to the Pimpalner taluka of Khunde-h district. I have been working at this taluka as a Mamiatdar since July 1899, and the following nuswers are based on what I have observed personally of the people and the crops and on anthentic information collected by
- 2. The average minfall in each month for the last 10 Acare is Giaon pejou :-

Month	Inche	. Cculs.	Month.	Inches. Ceuts.		
January February March April May Juno	. 0	5 3 1 6 6 5 40	July . Angust . September October . November December	•	5 3 4 1 0	6 18 1 55 41 2

- 3. I do not think there is any observed to the extension of irrigation within certain limits in this talnes. Supposing rhat storage tanks are constructed on the three : of the taluka and a steady and sufficient water-snpply is kept up in the bandbaras, I think that shout 1,000 neres can be easily ndded to the total irrigated area of the taluke, which is about 6,000 acres. There may be more scope for further extension if water is available, but then'I think some obstacles will have to be faced, chiefly arising from-
  - (1) sparsity of population;
  - (2) lack of capital for the initial experditure for grawing the more expensive irrigated crops; and
  - (3) want of labourers.

The taluka is thinly populated and has get a very large culturable area (280,000 acres). Consequence is that more thin 20 per cent. of it is lying as unoccupied assessed land and as much lies fallow every year from the ozenpied land. However, there is a very extensive grazing land available

and so the people have greatly advantageous opportunity of keeping and breeding a large stock of agricultural cattle, chiefly cows and bullocks, and they make use of it to their ndrautage. Before the late famine this taluka was very rich in this respect ned now, though it has lost about 50 per coot. or more of these, still I think they will regain their strength in this respect if a few good seasons follow continuously. The bollocks that are bred in this taluka are of superior quality and quite suited to the cultivation of irrigated lands. The nhundance of cattle supplies good and abundant manure. The soil is, I think, snited for the bandhara irrigation, as it is not like the rich black cotton soil. Excepting the last faw years, the measons are known and so the people have greatly advantageous opportunity of had abundant manure. The soil is, I think, shifted for the bandhara irrigation, as it is not like the rich black cotton soil. Excepting the last faw years, the measons are known to be sufficiently regular in the commencement and cessation and hence no uncartainty of the supply of water is over known to have affected the crops. I think there is sufficient capital in the taluka and the banias have been found to be generally willing to invest capital in the irrigated land. The people appear to be generally satisfied with the existing revenue assessment and will not neglect irrigation for fear of cahanced rates. The number of cultivators of land being small as compared to the extent of agricoltoral land, they get lands, even irrigated, at very moderate rent med so have no fear on that account. I have not heard of any complaint about necertainty of tenure or the tenancy law, nor do I think there is any scope for such complaint nader the present Land Revenue Code. In the present state of the taluka, in a year of good kharif and rabi harvest there is n want felt of sufficient number of field lubourers, and nages go much higher than what they are at present. But I think, if more irrigation is possible the grains will naturally a tract sufficient numbers from the surrounding villages and taluks. bers from the surrounding villages and talukss.

- 4. No new irrigation works have been constructed in the 4. No new irrigation works have been constructed in the talaka for a long time by private capital and no instances of exemptions of enhanced assessments are known. I do not think there is much scope now in the taluka for any nore permanent irrigation works being constructed by private capital. But if any were possible, I would certainly recommend some liberal measures, such os granting of exemption of the bagalt assessment on the land irrigated for a certain number of years, say, 30, according to the expenses incurred and the water-supply minimationed.
- 5. There are no instances of tagai loans being taken for construction of irrigation work such as bandharas, etc. 5. There are no instances of tagai loans being taken for construction of irrigation work such as Landharas, etc. However, people have taken to well-irrigation in villages having no river irrigation since the last famine and are now gradually taking a liking for tagai loans. During the last two years about Rs. 8,000 were given for construction of new and repairs of old wells. There is, however, much scope for a large extension of this kind of irrigation in the taluka. Under the present system, however, it becomes rather difficult for the people to necept and for us to give any very large advances for the purpose. The people who are chiefly in need of well-irrigation belong to poorer classes and have got no sufficient security to give for the loans. As jimit land is comparatively very cheap in the talaka, we do not advance generally more than five times the amount of assessment on the land offered as security. Consequently one who reks for a loan of Rs. 100 has to offer security of hand assessed at Rs. 20 or thereabout, which is not always practicable. For such loans personal security cannot generally be depended on and solvent cultivators do not generally offer to stand security for such people. Consequently for this taluka at least I would strongly recommend any or all of the liberal measures given below:—
  - (1) Reduction of the rate of interest.
  - (2) Remission of the interest.
    (3) Partial remission of the advance.
  - (4) Total remission of the advance in case of failure of the attempt to obtain water.

As the present rules stand. I think no extension of period of repayment is necessary. The well tagai loans never exceed Rs. 300 in each case, and I think a period of 12 to 15 years is quite sufficient for the convenient repayment of the loan with interest.

6. I do not think the extension of irrigation tends to 6. I do not think the extension of irrigation tends to injure the remaining cultivation by attracting its cultivators to the irrigated tracts. No instances of this sort are heard of in this taluka. People of this taluka are accustomed to irrigation and know the becefits thereof and so have evinced a strong desire to have means of irrigation increased.

#### B.—Canals of Continuous Flow.

My remarks under this head are based on the results of second class irrigation, under which systom thore is always a fixed area irrigated under each bandhura and this whole area is assessed at Kaynm Bagnit rates (permanent amalgamated Land Revonue and water-rate) independent of the kind of crop produced or water netually supplied. I have had no experience of first class irrigation.

Irrigation increases the value of the produce of the land to the following extent:-

- (1) By rendering it pessible to cultivate two harvests instead of one.
- (2) By leading to the substitution of more for 4 to 5 do. do. less valuable crops.
- (3) By increasing the yield-

(a) in a year of ample nainfall.

(b) in a year of scanty rminfall.

(c) in a year of drought.

Sneh cases are very rare. I have not seen of lands irrigated simply with the object of increasing the usual Jirait yield.

In a year of sennty minfell or a drought the Jirait or first crops in the irrigated area is at times watered by the channel water, as there is then no hope of securing the Yagait crop. This way the ouners of land succeed in gedding n good and more valuable (on necount of searcity) limit crop. But I do not consider this to be any substantial increase in the value of the produce; on the other hand, it has to be remembered that the owner has to pay the full Kayam Bagait assessment under the present system of Land Revenue cellections.

- 8. (1) As for the approximate ortimate of the increase in the tetal annual value of the produce per acre due to irrigation. I have got no special statistics collected; still from a clese inquiry with some of the experienced cultivaters in the taluka I have got the following data and have prepared an estimate for a village which has got 300 nores of irrigated land on the Kan River and where the irrigators have to pay Rs. 8 per sore as Kajam Bagait assessment. When four successive normal years follow the irrigations got a full rotation of props and so can be said to have enjoyed the full advantage of irrigation. I give lin Appendix A, attached hereto, my estimate of the not value of produce per acre of Thal land (i.e., ordinary good level land enlivated) irrigated, as compared with the same when unirrigated. From the figures it will be seen that in the tirst case the increase is approximately three times as much.
- (2) In a year of drought, if the water could be kept up to its full strength, there would be further gain on account of the high prices of the anturn. But if the supply would foil, the irrigator will even find it very difficult to have a khanif crop.
- 9. (1) There are no cases of cultivators or owners of lands paying annual water-rate to the owner of the canal.
- (2) If a tenant caltivates irrigated land as a tenant of the owner, he pays from Rs. 5 to 10 per sere in addition to the Kayam Bagait assessment.
- .(3) The owners of irrigated land pay to Gevernment an amalgamated Kayam Bagait rute from Rs. 3 to 15 per nore, instead of the jirait rate from munus 8 to Re. 1.

In the two cases above cited the tenant pays the rent on the irrigated area longed out to him under the agreement and in the third case the owner has to pay on the whole irrigable land he helds in the irrigated Thal area, irrespective of the crop raised or water supplied.

10. The irrigator has very little expendilure to incur to bring the water to the field from the nain channel. He has, however, to prepare the land to be irrigated much more enrefully and diligently than in the case of jirait land. He has to put in it mannre worth about Rs. 5 on an average per acre per year and to till and turn it over and over from 4 to 10 times even. When such land is leased to a teamnt, the landlord either shares the oxtra expenditure or the tenant gets a lease for lengthened period of about 10 to 20 years as a guarantee.

11. The irrigators whe do not manure their lands preparly certainly suffer in not getting a full and valuable
erep. I have, however, not heard of any land deteriorated
for being arrigated without manure, or from the prefuse or
too extensive or too frequent irrigation, from water-legging,
salt efflersscence or otherwise. In this taluka I have
housh that inthe irrigated hands in some villages there is a
regular arrangement of draining away excess water of
irrigation, and thus certainly riundness to the welfare of the
crep.

### C .- CANALS OF INTERMITTENT FLOW.

Mr., Kelkar.

14 Dec. 01:

Such canals are very few in this taluka and the area irrigated by them annually is quite ineignificant. Consequently I have very few occasions to nequire detailed intermediate in ennection with them. They are simple temporary earthen dams put across a flewing unlighted direct water therefrom for irrigating a few adjacent survey numbers. They are generally erected at a cost ranging between Re. 5 to Re. 25 and irrigate only a few acros. Ou their water the crops of wheat, gram or pea are only taken, and their flow lade for about two to four months in an average rainfall season. The owners of the irrigated lands themselves do all the work in connection with them and onjoy the beaefit thereon by paying an extra water-rate of Re. 1 to Re. 4 per acro. I think it is advisable to stimulate this kind of irrigation by means of suitable tagai advances. However, people in this taluka have not shown any very ardent desire to extend such irrigation. I also think that there is not much scope for extension of this irrigation. I am not in a position to answer in more detail the questions New 12 to 22, and so leave them with these remarks.

#### D .-- TANKS.

There is no irrigation carried on the water from tanks in this taloka ; consequently I have nothing to say with regard to questions Nos. 23 to 33.

#### E .- WELLS

34. In this taluka wells are generally dug in the castern plains, where there is no scope for river-irrigation. These wells are generally of very small size. They are rectangular in form and of fellowing dimensions:—

#### 6' x8' or 8' x 10'

Consequently they have very small helding capacity as compared with the big wells of the Eastern Decean. The depth of water is generally from 4 to 10 feet. The quantity is only sufficient for the requirements of a day or two, but it is renewed from percelation or side springs within the breaks in the irrigation work.

- (1) The average depth of permanent wells is from 20 to 30 feet.
- (2) The supply of water on this side is from percolation from the sides and not from springs from the bettem. They are not seen to become any way saline anywhere, but the supply is liable to fail in years of drought. But experience shows that the supply is chiefly affected during the year fullewing the year of drought, if that year rainfall is again seamty. In ordinary years they do not full appreciably.
- (3) Average cost of construction is Rs. 150 to Rs. 200.
- (4) A properly constructed well built on four sides is said to last even for 100 years.
- (5) Water is movally lifted by means of leather water lifts or mote generally drawn by two bullecks.
- (6) The average men attached to and commanded by a well is about 16 to 20 acres.
- (7) The average area irrigated in one year is about 3 or 4 acres. This is due to the very small holding capacity of the wells.

35 and 36. In the case of well-irrigation I have not been able to obtain authennic information pertaining to the points noted in those questions, still from my general information I make the following few remarks. Well-irrigation requires much more labour from man and bullacke than bandharairrigation. It supplies the cultivator with ready means of subsistence in times of famino. Sweet potatees, chilli, vegetable, wheat and other minor crops are grown on well water, and consequently no accurate estimate chuld be francel ensily as to the extent of increase in the value of the produce of land or in its total annual value per acre. On the whole it can be said that the cultivator gets about 3 or 4 times the value of the jirait crop on the same land.

37. There are rure instances here of land-owners of well-irrighted fields lensing them out to tonants, so i cannot say as to what do the tenants pay to them for these lands. On referring to the Government records of villages having wells constructed before the time of the original Survey Settlement, I find that he special bagait assessment or motosthal rate has been assessed on these lands. Consequently, Yimve're say into an additional revenue for the well-mater has been paid by the owners of fields to Government. In other districts I have known that on such lands an additional rate called motostkal rate is levied.

Mr. Kelkar.

Mr. Kelkar.

38. I do not think any serious difficulties are over encountered by the people in selecting a copt for proposed wello or in their actual construction. They generally celect a place of themcolves from the surroundings and at times a few people are seen to be inclined to call in the aid of an expect of a Publisher (i.e. one who is supposed to a now people are seen to be instituted to can in the are of an expert or a Panbhakya (i.e., ons who is supposed to forotell the existence of water in particular place or otherwise) at their own cost; as for construction there is ample supply of suitable otime and other materials required in supply of suitable etme and other materials required in the taluka. As yet there have been no fastances in which assistance was offered by Government or by local bodies in the shape of expert ndvice, trial berings, etc. I think that euch assistance can with advantage be given by making, if pussible, the genlogical survey of the portions of the taluka in question and chiefly by free grant or grant at a very moderate rental of the use of beriag tools in the wells in which water is despaired of by ordinary means available to the owner of the land. Trial borings also may prove of some value. As far as my experience goes I have found the people to dig their own wells without asking for any leass for the purpose, but when they make cure that there is water available and the work is being worth constructed they come up for a loan. they come up for a loan.

- 39. I nm not in favour of the construction by Government of wells in land which is private property, as I think the scheme will not be liked or agreed to by most of the people.
  - (1) Construction of wells by private agency is far more casy and much less expensive than by Government agency. I think that a well which agriculturisto construct for its 200, will cost Government at least Rs. 300, if not more.
  - (2) Government wilt not be prepared to invest fends in such works if they are not used by the people concerned and if they will not get any retorn therefor in the form of additional water-rate at least on the land likely to be irrigated from them. This would necessitate the passing of certain agreement by the parties concerned, from which they can never recede afterwards. Cultivators will not be ready to accept the responsibility so

- 40. If by temporary wells are meant bludkis or other similar kaoheha wells, then I say that snob wells are very rarely constructed in this taluka. There are some wells in the taluka which consist of only holes dug deep with water in them, and without any mesonry work, on which some land is sometimes irrigated by means of temperary arrangement on a wanden structure for raising water by a lenther mot or water-lift. These are not properly speaking temperary wells but knohela wells. I do not think any particular measures are necessary to encaurage the construction of such wells in a year of seasty rainfall.

P.S.-With reference to question No. 5, I have to add a few remarks and I hope they may be take for what they are worth. Against the present tagai system always two objections are chiefly raised: (1) that the recipients of the leans do not get those promptly as they get them from the sowkars; and (2) that they have to catisfy the demands of blockmailing by subordionto Revenue Officers.

As regards tha first objection, I think that the objects for which tagni loans are asked for under the Land Improvement Loans Act, 1883, are not emergent and innoinent necessities like the demands under the Agriculturists' Loans Act, 1884. Consequently, the grauting of these can brook the delay without much injury to anybody, that is, at times inevitable on a second of delailed in quiry that is to be made through the already bard-worked Rerenue Officers. I do not think the people are any way discouraged by this delay from coming up tendily for Land Improvement Loans. Improvement Loans.

As for the other objection, every officer who had to do something with these advances will have to admit that under the present system the evil is to some extent inevitable, as the very low-paid village officers cannot but be taken into confidence by the inquiring officer, how-sever he may try to be independent of them. The evil is only minimised if the Revenue Officer has the experience enough to see through their tactics and has a will to undergo a little more trouble presents to make present inquiries at the villages. tronble neces-ary to make personal inquiries at the villages

Statement showing the estimate of the increase in value of the produce in an acre of irrigated That land over that in unirrigated one.

- 1. Q. (The President).—You are Mamlatdar of Pimpaluer?—Yes.
- 2. Q. How long have you held that office !- For 23
- S. Q. Were you there during famine? Yes.
- 4. Q. You I nve sent in a very interesting paper containing a great deal of detailed information. You say the culturable area is 220,000 neres? Yes.
- 5. Q. Of these 165,000 are protected by bandharas and wells?—The largest area is under bandharas. The whole area is not, lowever, uctually irrigated.
- 6. Q. About how much of the nrea is irrigated?—About 6,000 acres under bandharas and 3,000 neres under wells.

- 7. Q. Out of 95,000?-6,000 only.
- 8. Q. That is very little?—Yos.
  9. Q. There are wells in 31 vallages?—Yis.
- 10. Q. The area under them is 70,000?—The total area in 34 villages under wells is 2,000 oat of the total culturable area of 70,000.
- 11. Q. About how much does each well irrigate?—About 3 or 4 neres.
- 12. Q. You only in your reply to printed questions "people in this talaka are for a long time accustomed to irrigation." Is there any domand for an increase in the number of band haras!—No; I do not think there is any scope for more bandharas, but if there was a better water-supply a larger area could be brigated.

- '13. Q. You say only about 8,000 acres are actually 'irrigated every year?—Yes.
- 14. Q. Are the people very anxious to irrigate more?— Yes, there have been several petitions for a storage tank on the Kan river; that implies that if the present supply of water is increased a greater area will be trigated.
- 15. Q. Tanks are better than wells ?—Yes; and inquiries have been made about constructing storage tanks; last year a project was frained to make a tank on the Kan river, but I think it was rejected.
- 16. Q. Are there any disputes among the villagers about the distribution of water from these bandharas?—If there is only one village under the bandhara, then there is no dispute; but if the water goes down to two or more villages from the same bandhara then generally there are disputes; but people manage to take the water by turns. If the Irrigation Department distributes water by means of distribution pipes to two villages at the same time, then that gives cause for complaint; but if there are turns fixed, then there are no comploints.
- 17. Q. To whom do they complain?—To the Irrigation Department and also to the Collector.
- 18. Q. Are there any sites in your talnka in which storage reservoirs might be made?—Tes; there are. There is one on the Panjara river; one on the Kan, and one on the Burai.
- 19. Q. Have they been examined?—Yes, the Panjara project was considered some years ago. The project on the Kan was submitted but was rejected. There was some correspondence about the Burai river project and it was surveyed last year.
- 20. Q. You say, "I would particularly urgo on the necessity of taking up the storage tank on the Kan river." That is the one you have just mentioned?—Yes.
- 21. Q. What was the name of the proposed tank?—The Malangam tank at Dahiwel.
  - 22. Q. Was Dahiwel tank begun as a famine work?-No.
- 23. Q. Do you think it is very important for your taluka?—Yes; for I think bandharas on the Pavjara are better placed than on the Kan.
- 24. Q. Is there any demand for an increase of well-irrigation?—Yes, there has been since the last famine.
- 25. Q. Are taken indvances in demand?—Yes, during the last two years I have given about Rs. 8,000 for wells.
- 26. Q. Do the people often come to you for takavi ?— First they make petitions to me and in the course of time. I submit them to the Prant who sanctions the grants.
- 27. Q. Do they make any complaints about the rate of interest or about the time allowed for repayment?—No, because the time allowed is quite sufficient.
- 28. Q. How long does it teke a man to got his advance?—Generally he gots it within 2 or 3 months.
  - 29. Q. Do they pay 5 per cent. P-Yes.
  - 30. Q. De they complain about it ?-I de not think so.
  - 31. Q. (Mr. Ibbeton).—How long have you known this district ?—I have been in this district for 25 years.
    - 32. Q. Where were you before that P-In Satara.
    - 33. Q. Is there much wheat grown there?-Yos.
    - 34. Q. A very large area?-Yes.
    - 35. Q. Is the area more than that under rice?-Yes.
- 36. Q. You say there is no scope in this taluka for the construction of smell tanks?—Yes; I mean tanks for irrigation.
  - 37. Q. Why?—Because there are very few sites at present in my taluka suitable for that purpose.
    - 38. Q. There are no sites !-- Vory few.
  - 59. Q. If there were eites !- Then I think more could be done.
    - 40. Q. Would you recommend many tanks ?-Yes.
  - 41. Q. Do you think the people would use the water P-Yes, after they get used to that sort of irrigation.
  - 42. Q. If they use water from the canals, bandharas, and wells, is there any reason why they should not use water from tanks?—Nothing in particular.
    - 43. Q. Would it be useful for rice ?-Yes.
  - 44. Q. Could they grow wheat here if they got water for irrigation only up to the end of December or must they have

- the water later on ?—They must have the water till the end Mr. Kelkur. of February.
- 45. Q. The wheat crop would fail if the water failed 14 Dec. (1. before that P-Yes.
- 46. Q. You say that kachcha bandharas do a great deal of good in ordinary years although they are not much used in years of drought?—Yes, because in a year of drought there is not sufficient water for the bandharas to irrigate groups.
- 47. Q. If there is not enough water on the kacheha bandharas then there are the pakka bandharas that can be used ? —Yes, the pakka bandharas are on a personnial stream.
  - 48. Q. Are they useful in ordinary years ?-Yes.
- 49. Q. (Mr. Muir-Mackenzie).—The population is very backward P—Yes; the cultivated area is very large as compared with the population, and consequently the people enunction toultivate a larger area.
- 50. Q. Inigation increases the value of the crop a good deal?—Yes, about three or four times.
- Q. Do you think the rate of interest prevents the people from taking takavi?—No.
- 52. Q. Sopposing you said to a man, "you can use the water free of charge," do you think that he would make a kachcha bandhara?—Yes; he would be induced to do it.
- 63. Q. Would you make many more pakka bandharas?—No, because there are no percunial streams other than the three rivers mentioned above.
- 54. Q. Were any of the takavi wells made in the famine of 1896 or 1899?—In 1899 famine.
- 55. Q. Are they pakka?—Yes, some of them; and some of their are kacheha.
- 56. Q. Do you think they will be used P-Yes; because generally I find that in villages where there is no bandhara irrigation people take to well irrigation, but where there is bandhara irrigation people do not like wells.
- 57. Q. Why are half of the number of wells marked as out of neo?—Because they are not used for one reason or another.
- 58. Q. How is the area irrigeted by wells increased by 50 per cent. in the year of drought?—Because then there is no dry crop. In my talnka there are large dry crop areas, and the people don't care to have well irrigation.
- 59. Q. At what rate of interest could a cultivator borrow money from a banis ?—At about 12 per cent.
- 60. Q. Then they don't complain of the Re. 5 rate charged by Government P—No.
  - 01. Q. You don't think it is heavy P-No.
  - 62. Q. Will you recommend it being reduced .- Yes.
- 63. Q. Why?—To induos people to come forward and make wells where there are no wells. It would be a real inducement, while it would not make any serious difference to Government.
- 64. Q. Would it make any difference in the case of an eutire remission?—There would be a difference.
- 65. Q. (Mr. Ibbetson).—What remission?—Remission of a takavi advance in the event of no water boing found.
- 66. Q. What would you remit?—I should remit all the money spent for the purpose of sinking the well if water is not found.
- 67. Q. How are you to know how much has been spont?—That can be ascertained.
- 68. Q. Do you think there would be no difficulty about that P—No.
- 69. Q. Supposing a man borrows Es. 500 for a well and spends some portion of it on a wedding, how would you know how much he had spent on the well?—By a panchnama. Besides I would not give him the whole advance unless he finds water.
- 70. Q. Would you work with the trial shaft first? -Yos, Rs. 25 should be given to begin the work with the shaft.
- 71. Q. You would never give an advance unless there is water?—Yes; I have never done so.
- 72. Q. Do the people know that they will be assessed on wells which they make?—They think that at the time of the Revision Settlement they will be assessed. That is my supposition.
  - 73. Q. Don't they know what the law is ?-No.
  - 74. Q. Do you think they are assessed more?—Yes.
- 75, Q What scenrity do you take?—We generally take the land as security.

Mr. Kelkar. 76. Q. What olse ?-Nothing.

77. Q. Is the land sufficient accurity ?-It would be 14 Dec. 01. after the well is constructed.

- 78. Q. There are I suppose cases in which a man's whole laud is not a sufficient accurity?—Yes, there have been soch instences.
- 79. Q. How mony years do you generally allow for recovering the loan?—Up to eight years, with instalments of from Rs. 15 to Rs. 25.
  - 80. Q. The lew allows up to 20?-Yes.
- 81. Q. Do you think eight years are enough ?—I think they are with shout Rs. 15 to Rs. 20 as annual instalments. It would depend an the amount odvanced.
- 82. Q. Would you recommend from 12 to 15 years P— That should be the maximum time ellowed for a losn of Ils. 300.
- 83. Q. Do you ever give more than 8 years ?—If a man gets Rs. 250 or Rs. 800 we give more than ten years.
- gets ks. 250 or ks. 300 we give more than ten years.

  84. Q. You say "oven in the black soil thals there is demand for water in seasons of average rainfall and much more so in timee of prolonged drought." Have you ever seen black eoil irrigated here?—I hove described it in my paper; the black soil in my taluka is not black cotton soil; it appears black in coloor, but I do not think it is the some es the block cotton soil of Gojarat in quality.
  - 85. Q. Is it irrigated ?-Yes, it gives a very good crop.
- 86. Q. (Mr. Rajaratna Mdlr'.-The present rale is that
- 87. Q. In the case of a poor rayat, would you not extend the period supposing he tokes Rs. 100?—That would depend upon the produce that he would get on the outlay. He should get out of debt as soon as possible and so I won't recommend a longer period.

88. Q. If he chooses to do so, he can pay within the period?—Yes.

- 69. Q. Would it be an inducement to extoud the period to 30 years?—Yes, in the case of large loans. Under additionary circums ances the people glodly poy Rs. 10 or Rs. 12 n year.
- 90. Q. You say that the rayats are not aware that their improvements will not be taxed of the next revision of settlement. Are they under the impression that there will be an enhancement?—Yes. There will be enhancement ou account of higher prices; but the people won't believe that it is on account of the increased prices; they will only think that it is an increased assessment.
- 91. Q. The increase on had in which a well is constructed will not be higher than the increase upon lond which

hos no woll?—Undor the Land Revenue Gode I don't be think it should be higher.

- 92. Q. Should there he a guarantee to the rayat that improvements are not to be taxed ?-Yes.
- 98. Q. Do you think the matter should be explained to them P-Yes; that would indoce them to take loans.
- 94. Q. If the fucts ure properly explained to them, would they take more taken if -Yes, it would stimulate them to do
- 95. Q. Do you think the rayats know the value of irriga-tion f—They don't like well irrigation in my taluka. They prefer bandhara irrigation because it is very easy to Well irrigation takes more time, money, and labour.
- 96. Q. Are there possibilities of extending bandhara irrigation?-How many acres more would you irrigate ?-About 1,000.
- 97. Q. On the existing or new bandharas? Under the existing bandharas; there could be no new bandharas. If you make a new bandhara between two bandharas, the people would object to it.
- 98. Q. The new bandharas would effect the supply of lower bandharas?—Yes, consequently there would be objection to the making of new bandharas. If there is a storage tonk that would increase the emply of water and that would give them the opportunity of extending irrigation.
  - 99. Q. You would rother have u storage tank ?-Yes.
- 100. Q. Do you think the people would be willing to construct these tanks if they were exempted from puying water rate?—No; because they would not have sufficient fands.
- 101. Q. You refer to the necessity for granting remissions on certain bandharas if storage reservoirs are not con-structed?—Yes, I refer to the Kan river.
- 102. Q. Are the lands not irrigated from bandharus?— Yee, they ore. But they don't give very valuable crops. Where they esed to get sugarcane erop before, new it is not possible for them to get it.
- 103. Q. What is that due to !-On account of the diminished supply of water in the river.
- 104. Q. What assessment do they pay?—Full assessment. The consolidated assessment has been based on the rotation of crops.
- 105. Q. For how long has cultivation of sogarcane disappeared?—I think for about twenty years in some villages.
- 106. Q. In this case you would recommend the reduction of ossessment?—Yes, but I would not recommend reduction on all areas. In the case of villages where there are tion on all areas. ne complaints I would not recommend any reduction.

WITNESS No. 44-ME. R. B. STEWART, COLLECTOR OF KHANDESH.

- Mr. Stewart. 1. Q. (Mr. Muir-Mackenzie).—Wore you in the Pauch Mahels doring the famine?—Yes.
- 14 Dec. 01. 2. Q. Were many kachcha wolls dried up?-Yca; B good many.
  - 3. Q. Were they spread over a large area ? Yes; they were used for irrigating grain and fodder crops.
  - 4. Q. How many cores did each well irrigate ?- I de not remember.
  - 5. Q. About 2 or 3?-I eboold think about 4; I om not certuio.
  - 6. Q. Did cook well cost moch?—No, very little. Wo only advanced R30 to R60 as takavi. They dug the wells themselves, what they wanted money for ohiefly was water bege, ropes, etc.
  - 7. Q. I suppose at the end of September you stopped odvancing takavi for wells?—No; we gove a good deal after September; I went there in the middle of September; wo made considerable odvances efter that. I um pretty sure that we mude odvances even in January.
    - 8. Q. For welle ?- Yes.
  - 9. Q. Is a large amount of takovi given out in the Panch Mahals ofter September in ordinary years?-No.
  - 10 Q. Do you think that it would be a good thing if in case of the failure of raine before September measures were taken to distribute a large amount of takavi to

- enable the people to construct kacheha wells?—Yes. "
  provided the people will utilize the wells. In one case a
  Patel told me that he had four oxen, of which three hed died owing to drought, and he had a well the whole time.
- 11. Q. He made no attempt whatever to irrigate o crop?—No.
- 12. Q. If money was available he could have got some? -Yes, but he did not want it in that particular instance.
- 13. Q. The system should be to give takayi advances by the end of September if rain fails, for kachcha wells?—
- 14. Q. On whot was famine labour particular employed in the Panch Mehala?—On roude principally. particularly
- 15. Q. And on what else?—On tanks so far as we could get sites. We could not get very many.
- 16. Q. Do you prefer tenks to roads ?—Yes; I prefer lerge tanks. I have not had much experience of smell village tunks; we have tried them end I thinkthoy are very difficult to mnoago.
- 17. Q. Difficult to supervise P—Yes; we had vory great difficulty in getting establishment. We had to employ Telatis for these works. It is difficult, to make them understand what is wented of them and as a consequence in mony instances they moddled matters.
- 18. Q. You think either large or small tanks should be made by famine laboor?—Yes.

- 19. Q. If tanks ore mode do you think the water will be used in ordinary years?—No; the people would not use the tanks in ordinary years.
- 20. Q. But they got a superior crop by irrigation ?-I doubt if the majority would appreciate is. The Kolis are in the majority, and I doubt very much whether they would take advantage of the water on account of the extra labour involved.
- 21. Q. Would the water not be taken up by the Bhils even for rice?—No; the Bhils as a chies ere not very good or industrious cultivators.
- 22. Q. Are there not a sufficiently intelligent number among them who would build kachcha wells?—Kachcha wells are built more in the west than in the east. The district is divided into two parts. There are not many kachcha wells in the Bbil region.
- 23. Q. I presume that the introduction of taker would not induce such people to dig many wells?—I do not think it would. There are places where they could dig wells in the Panch Mahals but they do not care to do se.
  - 21 Q. In 1896-97 you wore in Nasik P-Yes.
  - 25. Q. You know all this area very well?-Yes.
- 26. Q. Do you think that the river supply without any big storage tank will generally give a sufficient water-supply for these bandharas?—It will generally suffice for the existing area, but it is not safe without e reservoir.
- 27. Q. Would you prefer a series of storage tanks ?-Yes, cortainly; as they coold supplement irrigation in good years if necessiry.
- 28. Q. Wos much takavi granted in 1896-97 in Nasik?
- 20, Q. Was there a demand for much more than was granted?-Ne, I don't think so,
- 30. Q. What step would you suggest for stimulating the demand for the purpose of building wells? Do you suggest any olteration in the rules in the shape of lower interest or longer periods for payment of instalments?—I don't thank you want either. The interest is very small compared with the bazaar rate and the present period is quite long enough. It is not necessary to create a fictitious demand. Once of our Deputy Collectors gave away enormous sums of money in one year for takavi which was not used for spricultural purposes. used for agricultural purpo-os.
- 31. Q. It was misappropriated?—Yes; but there are real demands in particular parts, and we ought to see that they get money easily.
- 32. Q. Do you think that the rate of interest is a deter-rent?—I do not think so.
- 3°. Q. You say the people could be induced to take advances, but would they take them on the clear underadvances, but would they take them on the clear undorstanding that the money would have to be spent on wells?

  —Yes, certainly they know that perfectly well. I know of a few cases where money has been misappropriated in my charga; but it was perfectly easy to recover it at once. In a certain village there were 2 or 3 people who took about ha, 200 each for wells, and two menths later the Mamlatdar reported that they had not commenced digging. I directed him to recover the money and he did so.
- 31. Q. They probably had not spent the money ?- No. so it was easy to give it back.
- 35 Q. The only thing that would induce people to take takavi for wells is the personal energy and infloence of individual officers?—Yes, that is so.
- NG. Q. (Mr. Rajaratna Mdlr.)—Do you pey the takavi in instalments after a certain amount of work is done?—Yes; rery often in good years we require n man to show that he has found water. He digs a well out of his own resources and if he finds water we give him money to build up the well.
- 87. Q. You would not give him money to dig a trial shuft !-- Yes; if there is no doubt ebout the man's honesty.
- 38. Q. But should there be any doubt about the many you have his lend as security?— We have probably to limit the amount of money given ont, as the man may not use it in building a well end give us trouble to recover it.
- 39. Q Your doubt applies to his misappropriation and not to his scenrity?—No; there is no doubt about the security: we satisfy ourselves about that,
- 40. Q. If he applies for Rs. 200 and is paid Rs. 50 as first is stellment and then after inspecting his work you pay the rest, would that not be u check against misappropriation at least to a great extent?—Mr. Muir-Mackentie. I think that is dono.

- 41. Q. (Mr. Ibbetson). You have get no rock for dig Mr. Stewart. ging wells in the Pauch Mohals?—Vory little.
- 42. Q. How can a man dig a woll before you give him 14 Dec. 01. an advance?—It is not obsolutely necessary for him to dig a well. The As-istont Collector goes round and if the man chows that he is actually working on the well, he gots an advance.
  - 43. Q. His bond fide is accertained ?-Yes.
- 44. Q. Do you think that for want of time to make such enquiries a large number of people who were bond fide desirous of digging wells did not get advances?—Yes; the Mamlatdar has to make enquiries on the spot and he soldem Mamiater has to make engilies on the spot and he soldem travels with as much energy as he should for the purpose. I am afraid there is e great deal in the complaint that the people don't get the full amount of takavi from the Mimbitdar's office. I do not think there is much doubt that eome of the money sticks. An Assistant Collector should go round and satisfy himself on the spot and pay the money himself.
- 45. Q. You cannot cheek the leokage P-Ne, the man goes to the office, and applies for the money, giving a rapec or so to somebody. It is difficult to stop it.
- 46. Q. (Mr. Muir-Mackenzie).—You think the best way to protect this district against famine in the future is by extending the number of wells as largely as possible in Nasik f—It would be every good thing io Nasik; they are easily made with very little labour and will be valuable in times of famine. Alany were built in 1876-77 and were not used for years; they were cleared out and used again in the last famine.
- 47. Q. Would it be attractive to the people to give them grants for the construction of wells and to charge them only bagait assessment in the land actually irrigated under the wells? Would you favour that proposal?—I do not think it would be populor.
- 48. Q. Give the men possession of the well and merely fix an assessment on the irrigation?—I have never seen it tried or consulted cultivators about it.
  - 49. Q. Would you object to it being tried?-No.
- 50. Q. (Mr. Ibbetson).—Are wells of any use as famine works P-I have never tried it myself, it was suggested by some one last year.
- 51. Q. (Mr. Muir-Mackenzie).—They did dig trial shafts !—That was all that was tried.
- 52. Q. Would you employ famino labour on woll work?—No, I do not think famino lobour is good for that kind of work; we give the people takavi and allow thom to do the work themselves. We did that in Nasik in some villages in 1895-97. The people not only started works, but they kept village labourers employed.
  - 53. Q. Did they cultivate overything ?-Yes.
- 54. Q. Do you think meny people would be inclined to do that ?-I do not know; I am rather doubtful about it.
- 55. Q. Why?—Because somotimes they fix sites for wells and don't find water.
- 56. Q. You might advance a small sum of monoy for a trial shaft; you could risk that?—Yes.
- 57. Q. My point of view is not so much the matter of employing famine labour as to derive some means for the protection of the country against famine? Would you have therement construct wells?—At present I would not.
- 58. Q. Do you think that Mr. Simcox'e estimate of Rs. 250 for the construction of a well is correct ?—Yes, it is very fair.
- 59. Q. What would it cost to make a well through the Public Works Department?—I do not think it would cost more than Rs. 300.
- 60. Q. You would not advocate Government constructing wells?—I would rather see the people do it themselves.
- 61. Q. If there were Government wells do you think people would take water?—Yos.
- 62. Q. We have cases of people allowing their wells to fall into disuse; there would be some fear that in ordinary years they would not take weter?—We could take an agreement that the assessmoot will be paid whether the well is used or not.
- 63. Q. In that case you are sure they will take water.

  At any rate you agree that it is worth while trying ?-
- 64. Q. Would you profer tank work to anything clso for famino labour !- Yes. I think it is easier to supervise;

Mr. Stewart, you can manage it better, but there is always the danger of discuso breaking ont.

· 14 Dec. 01.

- 65. Q. There is not the same danger on read worke?—No, the people are a great deel more scattered on read works.
- 66. Q. A tank may possibly be of service, bot some roads cannot possibly be of any nec?—Yes, some of the roads constrooted by famine labour are of no ase.
- 67. Q. Tanks may possibly be of some use?—Undoubtedly.
- '68. Q. (Mr. Ibbetson).—It has been suggested that where takavi has been given to make a well and the man has been much to get water it should he remitted; what do you think of that?—I think it would he only fair to remit.
- 69. Q. Would there be any practical difficulty in finding ont how much a men has spent on the work?—I don't think so; a panch could generally fix what has been spent.

# WITNESS No. 45-Ma. DHONDO SHAMMAO GARDD, Pleeder, Dhulia.

# Answers to printed questions.

#### A .- GENERAL

Mr. Garud.

The answere given below refer to the Dhnlia and Chalisgaon talukus of the Khandesh district and the Malogeon taluka of the Nasik district. I am the proprietor of more than 1,200 acres of land in the aggregate in the Chalisgaon and Dhulia talakus of the Khandesh district and am the Jagirdar of Chendaupuri in the Malegaon taluka of the Masik district.

2. The average rainfall in each month of the year in the Malegaon, Chalisgaon and Dhalia talakas is as under:—

Name of Taluks.	May.	Jano.	July.	Angust.	Beptembor.	October.	November.	December.	January.	February.	March.	April.	Total.
Majegaon Challsgaon Dhulla	0-71	6-42	5 29	8.82	7.13	2·61 3 67 1·80	*38	199	11	-14	0.3		21·41 29 70 12·36

- 3. (1) No.
- (2) There has been gradual decrease of cattle since the introduction of the Forest Laws; and the number is much reduced by the famine of 1900.
  - (3) Same as above; dae to same reasons.
  - (4) No.
  - (5) No; except in yoars of famine or drought.
- (6) Yes; there is lack of capital for raising expensive irrigated crops.
  - (7) Not that I am aware of.
- (8) Up to the passing of the Land Revenue Code Amendment Act there was no uncertainty. People believed that the rights enjoyed by them were scene. Since the passing of the Land Revenue Code Amendment Act this faith in the stability of their tonure has been considerably sheken. They are inclined to imagine that at any time their vested rights might be interfered with.
  - (9) Aïl.
- 5. Loans are not freely taken by the people for tho extension of irrigation because Government officers feel that the responsibility of recovering the loans lies upon them; and they therefore take great deal of time in completing their inquiries; and even then recommend only persons of well-known solvent circumstances. The rayate are also chary of taking these loans because their pnactual re-payment is rigidly enforced; and very often the rayat is obliged to

- borrow money from sowcers to repay over-dao instalments of tagai loans.
- (1) I would recommend the reduction of the rate of interest to Rs. 4 per cent. per annum.
  - (2) No.
  - (3) No.
- (4) I would recommend tolal remission in case of failure, of the attempt to obtain water.
- (5) The rules under the Land Improvement Leans Act (XIX of 1883) are sufficiently liberal. What is wanted is that they should be carried out in the same liberal spirit. It would recommend that in seasons of famine or searcity, repayment of instalments of tagai loans should generally be suspended.
- 6. I am not in favour of grants-in-aid.
- (1) No.
- (2) Owing to the frequency of famine in recent years the desire for having means of irrigation as a measure of protection has increased; thus in good season irrigation from wells is not much availed of.

#### E .- WELLS.

- 34. The average depth of permacent wells is 30 feet. Water is generally supplied by springs. It is liable to fail in seasons of drought only. Average cost of construction is Rs. 400 with two mots. With ordinary repairs a well will lust more than 40 years. Water is usually raised by mots.
- (6) The average area attached to and commanded by a well is 4 ecres.
- (7) The average area irrigated in any one year is 2 acres
- 38. (1) Yes. Very often attempts to ohtain-water are unsuccessfol.
- (2) Generally no serious difficulties are experienced in the actual construction of wells, but professional advice would be of value.

Never to my knowledge.

- It would decidedly be aseful to provide expert advice, make trial horings and supply being tools to ascertain the sapply of sabsoil water. It is desirable to have a specially trained establishment for this porpose.
  - 39. No.
- 40. Very rarely. For the year in which they are dog they are a protection against drought. In a year of scaaty rainfall tagai should be given for digging wells.
- 1. Q (The President).—Are you a resident of Dhulia ?
  —Yes.
  - 2. Q. I suppose you know Klandesh very well?-Yes,
  - 3. Q. You were here during the last famino ?-Yes.
- 4. Q. What do you think would be the most suitable steps to take to better eneme Kbeudesh against another femino than it was this time?—I would recommend encouragement in the increase of making tanks and wells.
- 5. Q. What tanks do you mean, large or small?—Small tanks which would he completed during the year, not large ones which cannot he completed and used for years.
- 6. Q. You mean tanks adjoining villages P—Ycs, those tanks which would raise the water level of, wells adjoining them and would give protection to people in time of famine.
- 7. Q. What would the people grow under them, would they grow rice?—Wheat end other crops.

- 8. Q. In the beds of the tanks ?- Yes.
- 9. Q. Yoo don't think they would grow anything under the embankments of the tanks ?—If there is water in the tanks, then they would grow rice, wheat and other crops.
- 10. Q. They woold hardly grow wheat in the monsoon?
  -Wheat is grown in the cold weather.
- 11. Q. Could that not be tried in a year of drought? .-One or two waterings would be quite sufficient for wheat.
- 12. Q. You say "leans are not freely taken by the people for the extension of irrigation; because Government officers feel that the responsibility of recovering the leans lies upon them—and therefore recommend only persons of well-known solvent circumstances"?—I mean solvent within the knowledge of the Memlatdar; there may be other people solvent, but they may not be known to the Mamlatdar.

- 13. Q. What do you propose?—I propose that a man who has no mortgages on his land may be given takavi upon the security of his land.
- 14. Q. Could a man very easily prove that he has no mortgages?—The Mamlatdar can setisfy himself from the village officers; the Patels know whether a man has mortgaged his land or not.
- 15. Q. How long does it toke generally to get takevi advances?—A long time generally; they have first to make applications to the Mamintdar, who sends them to the village officers to make inquiries.
- 16. Q. How long does it take altogether?—I should Mr. Garud. think it takes more than six months.
- 17. Q. Do you think that, if the interest was reduced 14 Dec. 01. to .4 per cent. from 5 per cent, it would make much difference?—It would make repayment more easy.
- 18. Q. Would you recommend that Government should lend mousy without interest at all?—No; Government are taking a low rate of interest elrendy.
- 19. Q. Do you consider the bandhara system, us practised in these provinces, is a good system!—Yes, it gives water to the nearest village for drinking purposes and irrigation.

# TWENTY-SECOND DAY.

# Poona, 18th December 1901.

WITNESS No. 46 .- Mr. C. N. CLIFTON, Superintending Engineer, C. D.

Answers to printed questions.

#### A .- GENERAL.

- 1. The Collectorates of Poous, Ahmednagar, Sholdpur, Kasik and Khandesh, but more especially to Poone, which is my head-quarters, and in which district the two principal irrigation works are situated. I was formerly Assiscipal irrigation works are situated. I was formerly Assistant Engineer in the Pooun Irrigation District and the Fire Caual (then a separate churgo) from 1880 to 1880, but principally on construction work. Lately I have been Superintending Engineer, Central Division, but my work includes, in addition to the irrigation, all the Provincial and Local Fand works in the Division as well as the Military works in all Military Stations except Poone and Kirkes and Davláli. I have else, during the tenure of my office, bed extensive famine works in my Division.
- 2. This information will be given in the reports for each district.
  - 3. (1) I do not think it so.
- (2) Not as an ordinary rule, I believe. There may be difficulty now in obtaining cattle for ordinary egriculture owing to lesses during the famine, but the irrigated area io not very extensive, and there should be no difficulty in getting a suitable supply of cattle even for extended irriga-
- (3) I think there is no great scarcity of munure, as far as I can learn.
- (4) There are obstacles to irrigation in block-soil in so far as the oultivators are not willing, and as a rule do not require water to irrigate black-soil for food-crops. Where water facilities are available, however, they are very willing to extend irrigotion to black-soil for sugarcans and other valuable crops.
- (5) There are obstacles in some cases owing to uncertainty of supply of water and its too lete commoncament or early cessation.
- (6) I do not think that feer of cubanced rate or revenue assessment is an obstacle. The people are well ecquainted with the rales and rotes of water, at all events where there is only crop rate cherged. There may possibly be such fear in cases of loads where consolidated rate is charged, but I am unuble to speak definitely on this point.
- 6. I do not think so. Yes. In Khándesh and Násik, where people with louds nuder bándháras are constantly petitioning for storage works and improvements. The Chankapar Tunk is a particular case in point. I think, generally speaking, that there is a desire among the people to have means of irriention extended as increased. to have means of irrigation extended or increased.

## B .- CANALS OF CONTINUOUS PLOW.

- 7. (1) It is not a general rule and in fact I bolieve very exceptional to hove two harvests. The people are not enterprising eneugh, and there would possibly be difficulty in obtaining enough manner.
- (2) There is always o tendency to increase the urea of sugor cone garden and other valuable erops where water is available.
- 9. The average rate per acre poid in the form of a crop rate is given in Statement G of the Irrigation Revenue Report of the Bembay Presidency. Statement I-F giving water-rates in force on the different works.

- (2) For ordinary cultivation roughly Rs. 4 per sore, for Mr. Clifton. sugarcane as much as Rs. 20.
  - (8) Noue.

# 18 Dec. 01.

Above rates are paid on area actually irrigated.

# C .- CANALS OF INTERMITTENT PLOW.

Those enestions will be answered by the officers of the various districts. I have not the time at my disposal to describe the conditions of the different works in my five districts.

# D.-TANES.

By this, I presume, are meant village tanks, of which there are few or none in this division.

34. This information will be sent by the officers of the 34. This information will be sent by the officers of the various districts. As my charge comprises an area of 32,000 equare miles, it would be impossible for me to give information as required for each of the main treets. A reference might be mode to a report on the best means of oncouraging the extension of well irrigation by Mr. F. D. Campbell, C. E., circulated with Government Resolution No. 448 C.W.—1059 of 23rd June 1885.

## II.

2. There is ordinarily a demand for water in the Deccan during the south-west mensoon for perennial and valuable crops, but not as a rule for cereals or food-grains. These latter given good rainfall come to maturity without artificial watering, and the cultivators refrain from applying for water. The crops that require irrigation number of waterings, etc., are in the Poona District as under:—

Class of Crops,	Period.	Numb of waterin	_
I. Persunial— (Sugarcano, garden crops, Pán, etc.).	All the year round .	25 to	85
2. 8 months— {Potatoes, sweet-peta- toes, ground-nets, ohillies, onions, gar- lies, etc.).	July to Fobruary .	15 to	20
3. Monsoon, dry— (Jowari, Bajri, Tur, Mug, etc.).	July to October .	2 to	6
4. Monsoon, wot— (Rice, wheat, etc.)	July to October .	4 to	8
5. Rabi— (Jowári, gram, wheat, oto.).	October to February.	3 to	6
6. Hat-weather— (Fodder, etc.)	April to June	6 to	, 2

Mr. Clifton. 18 Dec. 01.

The distribution is controlled by Departmental sobordinates with suitable staff of Inspectors, Patkaries, otc.; also measurers where crop rates are lovied. The irrigatism revenue is for the most part, realized in the shape of nerop rate. In the east of the 2nd class works in Nasik and Khadesh, in the form of consolidated rate.

3. Black-soil is not in my opinion saitable for tank embankments. The usual practice in tank dams in this Precidency is to have a portion of the interior of the dem to consist of a hearting made of mixture of black-soil nod maram or sand.

Massary core walls have not been used to my knowledge. Where the laud irrigated is hlack-sail, it is not found that there is much demand for water for monsoon erops in a year of average rainfall. Where, however, there are facilities for irrigation, there is always demand for water for sagarcane and garden crops on hlack-soil land. In case of proloaged drought, there is of consee demand for water. In such soils although there may be a falling off in the irriguled area in a good season, atill it is difficult to estimate, as io bad seasons the area irrigated may be limited by scarcity of water in the tanks or canals. In any case the revenue is not much affected, as it depends more on the quantity of cogarcane and valeable crops irrigated. There is a desire for irrigation works on the part of owners of is a desire for irrigation works on the part of owners of black-soil, but it is for the cultivators of sugarcane, ots., and not for monsoon crops.

5. There are no Provincial Irrigation Works in my

charge.
6. There are very few of these and very little information at my disposal. Such tanks are assent for men and cattle and to keep the sub-soil water at a high level.

I understand that in the Poona

cattle and to keep the sub-soil water at a high level.

7. Many wells ran dry. I understand that in the Poona District alone only 25 per cent. of the wells (oxcluding those under the influence of canals and tanks) were worked during the late famine. Average depths of wells in the Decean may be said to be from 30 feet to 40 feet and a good well costs from Rs. 1,000 to Rs. 1,500. Kacheba wells are from 15 feet to 25 feet and cost from ks. 100 to Rs. 500. They are usually what are called "Burkis" at the sides of nalis or near canals. The ordinary acreage served by a well is as under: served by a well is as under :-

For sogarcane from two to three ncres. For fruit-trees from four to five acres. For food-grains from six to seven seves.

8. There are practically no lands or crops injured by water-logging. The irrigation on this part of the Presidency is not on a sufficiently large scale to cause such, and the general conformity of the esantry does not lead itself to it either. There was at one time a certain amount of water-logging near Poons where extensive irrigation of sugarcane exists, but this has been lessened by more careful rotation and distribution of the water. No drainage works are nired. works required.

9. A statement is nttacked showing classification of the works on which relief labour was employed daring the late famiac.

The nncompleted works which I consider it desirable to complete as a charge against Imperial Revenue are as

Nasik District—1 Waghad Tank. Ahmednagar District—3 Maladevi Tank.

3 Ojhar Right Bank Canal and Musalwadi Tank,

4 Visapur Tank. Khándesh District—5 Chánkápur Tank. Poona Irrigation-6 Shotphal Tank.
7 Victoria Tunk at Warwaud. Saolapur District-9 Pathri Tank.

9 Wadshivaan Tank.

Of these No. 6, the Shetphal Tank, is already being completed as a Protective Work. It is to be filled from the Nfra Canal daring the monsoon and will serve a large tract of country near the tail of the Nfra Canal. The Maladevi Tank (No. 2) is fanoarably situated in a Ghunt District, and will provide storage for the existing Likh Canal and Olihar List Bank Canal and for the New Olihar Right Bank Canal (No. 3) which depends on the completion of the Maladevi Tank for its supply. The Musalwadi Tank is a Starago Tank to be filled from the Olihar Right Bank Canal daring the monsoon. As before said, the question of completion the monsoon. As hefore said, the question of completing these two works depends on the Muládevi Tunk being completed. It will be a very valuable protective work. The same remark applies to Chánkápar (No. 51 and Wöghad (No. 1). These are respectively Storage Tanks to supplemeat the supply to the various Landharas on the Girns and Kudwa River, and to extead the irrigation of the tracts of country below them, and being both in Ghaut Districts are likely to he very valuable Protective Works. The Weighad Tank classed as a productive work is nearly completed. The Viespur Tank (No. 4) in the Ahmedingar District has a large catelment area and is situated in a part of the country where irrigation is hadly wanted; although it is doubtful whether the tank will fill regularly, till as it will probably pay its working exposes, it might be considered. The same romark applies to the Warwand Victoria) Tank (No. 7) in the Poona District which will serve to irrigute 3,000 acres of rabi crops. As regards the Pathri Tank (No. 8) and Wadshivann Tank (No. 9) in Sholapur, they ere well on to esmpletion, and it would be a pity not to snish them, especially Pathri which is intended ultimately to supply the important mercantile centro of Bursi with water. The other large tank works commenced as famino relief works in Sholapur and elsowhere, I would leave as they are to be continued if required in the future as famino works. They are in rainless tracts and would he of little protective value as in years of drought they would not fill. This is the experience gained from the Ekrak, Mhoswad, Ashti and other tanks in the eastern portion of the Sholapar, Poona and Khaudesh Collectorates. The Odal Tank in Nasik and Parmapada Tank in Khšadesh nee intended ts feed bandbaras lower down the river on which they are situated, and even though they did not fill nre intended to feed bandbaras lower down the river on are intended is teed oansaaras lower down the river on which they are situated, and even though they did not fill would supplement the water-upply to the existing irrigation, so that there is perhaps more to be said in their favoor than in that of the others from which canals have to be taken.

taken.

13. It is difficult to give a scale of water rates for the whole of my Division which is over 32,000 square miles in extent. These water rates vary on different works and are senetioned and modified from time to time. Statement I-F, bowever, of the Irrigation Revenus Report of the Bendoy Presideacy, exclading Sind, gives statement of water rates per are in force on irrigation works. Distribution is controlled by especial establishment varying with the different conditions and requirements, and there is no general system or ratio of establishment to area irrigated or longth of canal or anything of that kind. Tanks are generally ompty or nearly so at the end of the irrigating seasan. The exceptions are the Khadak-Wasla (Lake Fife) and Ekrak Tank, in which case water has to be bushanded for the supply of water to Poona and Sholipor, respectively. Otherwise they would also be empty, every available drop of water being need for irrigation. Irrigation works get no eredit for increase of revenue dae to their construction, the revenue being limited to amount realized as water rate. The charges for maintenance and establishment are in some cases exaggerated by reason of the same establishment being emcharges for maintenance and establishment are in some cases exaggerated by reason of the same establishment being employed on civil works. For instance, Ahmednagar and Nésik are Imperial Irrigation Divisions, though the bulk of the work there, is other than irrigation and the irrigation works there are looked after along with roads, buildings and other public works, and in the case of Ahmednagar extensive Military Works by the Executive Engineer of the district. Sholdpor, on the other band, a neighbouring district to Ahmednagar, is a provincial charge, though the irrigation works are about four times as extensive as these in Ahmednagar. Still the mainlenance costs more than the revenue' management on every work in Sholdpar, while an exact. nagar. Still the mainlenance costs more than the revenue management on every work in Sholápar, while an exactly opposite state of things exists in Ahmedaagar. The proportion of working expenses to capital outlay as a little over a per cent. in Sholápar, while it is nearly 4 per cent. in Ahmedaagar. The Revenae Accounts of such large works as the Matha and Mira Canals may be taken as fairly accurate and indicating the financial results obtained.

. 14. I consider the protective value of irrigation works in the Decean very limited. The Mrs and Mutha are good works (though the Mutha is not classed as protective) as they have Ghant eatehments, but the tanks in the eastern part of the Division where the minfall is precarious can be said to have little or no protective value. If the minfall hoppens to be good and the tanks fil, it is quite probable that water may not be freely availed of and if the mins full the tanks do not fill. Even this year after a moderately good minfall the Mhaswad Tank, a tank classed to protective with an enormous eatchment, did not fill, the full anpply level being some ten feet below the crest of wester. Funding relief was certainly required in many of the villages a ominally protected by these tanks. I am unable to give any estimate of the extent to which the cost of faming relief would have been laserased, if these works had not been in operation. There was, however, no don't neconsiderable saving in the portion of the Poona District from the fact of the Nim Canal being in operation. of the Division where the minfall is precarious can be

- 1. Q. (The President.)-You ore Superintending Engineer of the Central Division !- Yes.
- 2. Q. How long have you held that position f-Two years.
- 3. Q. What has been your previous experience of irrigation?—I was in Sindh and on the Mutha and Nira causls some years ago, bot principally on construction. I have not had much experience of irrigation details in the Deccan.

- 1. Q. Did you ever have the administration of a canal as Executive Engineer?—Yes, in Sindh.

  5. Q. Engiocers have not much to do with administration there, it is in the haods of civil officers?—Yes; the revence administration. The clearance and repairs, etc., of canals are in the haods of the Public Worke Depart-
- ment.
  6. Q. Ie the rabi crop largely irrigated anywhere in the Deccan: —A good deal from wells, I think, and on canals where they exist.
- 7. Q. Do ther irrigate juari?—Yos; I have seen como irrigated from the Nira Canal.
  - S. Q. And wheat ?- Yes.
- 9. Q. You say in paragraph 3 of your memorandum, "Nack-soil is not io my opinioo suitable for tank embonkments. The usual practice in tank dams in this Presidency is to hove a portion of the interior of the dam to consist of a hearting made of a mixture of black-soil and muram or sand". I emphso the fact of its being black-soil country would not provent a dam being made if it was necessary." eesary ?-No.
- 10. Q. Have you seen much irrigation in black cotton soil?—I have not had much time since I have been here to go into details.
- 11. Q. Are you aware that it is very etrougly asserted that black cotton coil won't take irrigation?—Yes, I have heard it.
- 12. Q. You say in paragraph 9, "the uncompleted work which I coorder it desirable to complete as a charge against Imperial Revenue are as nuder; Nasik District (1) Waghad Tank." What is the stote of that tack?—It is nearly completed; it once failed and it was reconstructed. The object is to furnish water for improving the Pollshad and Value. is to furnish water for improving the Palkhed and Kadvo Canal systems.
- 13. Q. You say the work is going on ?—Yes, the waste weir has not yet been finished; the finel project will be sent to Government very chortly; it has been sent back for come alterations and will be resubmitted.
- 14. Q. Has it ever been before the Government of India ?—No, only before the Local Government. This refers to present proposale for completion.
- 15. Q. (Mr. Higham.)—Will the estimate go to the Government of India ?—I don't think so, ucless there is an excess over original estimate.
- 16. Q. (The President.)—You recommend it should go shead, and not be kept as a means of employing famios labour ?-Yes. It is going on.
- 17. Q. You mention noxt the Moledevi Tonk; what is the state of affairs there?-A good deal of the puddle trench has been done and the waste weir. It is the storego reservoir of the Pravari system that has been going on for the last two years as a famine relief work.
- 18. Q. (Mr. Muir-Mackenzic.)—Very little work hos been done on the tank; most of it has been on the canal?—The waste weir and part of the puddle trench has been dono.
- 19. Q. A great deal has been done on the conal?-Tho Ojhar Kight Bank oncol has been completed except for the masonry works. There is no canal direct from the reservoir.
- 20. Q. (The President.)-The masonry works are not yet sanotioned ?-No.
- 21. Q. Havo designs gone in ?—An estimate has gone in, I don't thick it has heen approved; most of these famine works have heen going ou on rough estimates; I have not had time to complete projects.
- 22. Q. Whot are the best works to ficish at once so as to obtain an early return upon what has alreedy boon spent?

  —The Potri and Wodshivno in Sholopur; they are rain-fed tanks; the Wagbad the only one which is nearly completed. The others are only just begun.
- 23. Q. Has the Shetphal Tonk no catchment of its own ? -No, it is to be filled from the Nim Canal.
- 24. Q. In what stoto is it new?-Most of the earthwork is completed; it has already some water in it.

25. Q. Will it be ready for the next mensoon?—Yes, I Mr. Clifton. thick so, we can fill it up as we like; the upper part of the dam has to be finished.

18 Dec. 01.

- 26. Q. (Mr. Higham.)—You can fill it every year?—Yes, the water of the canal is not much used in the monsoons, we have one tank on the Mutho Conal of the same kind, the Matoba tank, and have found it very useful.
- 27. Q. (The President.)—What stage is the Khamgaon tank in P—It has been partly carried out hat it is not a work that we can fill under present circumstances. The difficulty is that we cannot put the whole calculated discharge of 400 cusees through the tunnel.
- 23. Q. Is that on account of the water-supply of Poona?

  —Yee. The Poono tunnels just helow the pomping station and if more than 200 feet per second he passed down the water is headed back and the wheel stops.
- 29. Q. Ie the extension of irrigation retaided by this? Yes, it is impossible to widen the present thonel; we cannot close it; another tunnol could he mode.
- 30. Q. Howlong is it?—About this of a mile through rock.
- 31. Q. The neck of your bottle is, you may say, throted?

   Yes, we could pass it down but for the water wheel.

  It is an ordinary Poncelet wheel. Mr. Visvesvaraya is considering a project for improving motiors.
- 32. Q. (Mr. Muir-Mackenzie.)—Why was the tank made if it is impossible to fill it?—As a famine work there was no better work evailable. With good roins it may fill.
- 33. Q. Would there he any difficulty in substituting some other kind of wheel to get over the difficulty to which you refer?-No, I think not, bat Mr. Visvesvaraya has the questioo under coosideration.
- 34. Q. The project for the Khamgaon Tank was got up long one but it was rejected as the foundations were not considered suitable?—Mr. Visvesvaraya found a new site and it was sanctioned.
- 35. Q. It was reelly sanctioned as a famine work for want of something better?—Yes, like the Warwood tank.
- S6. Q. If these questione had been 'considered years ago and estimates prepared carefully, it would not have been necessary to do these works in a lurry P—No.
- 37. Q. You say in your note, "the other large tank works commenced os famine relief works in Sholopur and elsewhere I would leave as they are, to be continued if required in the future as famine works. They are in rainless tracts and would be of little protective volue, as in years of drought they would not fill. This is the experience gained from the Ekruk, Mbaewad, Ashti and other tanks in the eastern portion of the Sholapor, Poons and Khandesh Collectorates." Is there only means of connecting the Ekruk, Mhaswad and Ashti with the hills with a view to storage?—I don't think
- 38. Q. Does the Mhaswad not fill?-It is in the north of Sholapur and has 480 square miles of catchment, but it is in quito a rainless tract; you may got the heavy Madras monsoons, but that is quite nucertain
- 39. Q. And the Ashti ?-That is also in a very minless fraet.
- 40. Q. Is it possible to get anything from the Bhima river fute the tanke?—No, the bed is so low.
- 41. Q. (The President.)—You say in your note," tanks are generally empty or nearly so at the end of the irrigating eason. The exceptions are the Khadak Wesla Lake (Lake Fife) and Ekruk Tank?—Yes, the Khadak Wasla is for the Poons water-supply and the Ekruk supplies Sholapar; we reserve the water for the towns, otherwise they too would be empty.
- 42. Q. Do you understand the principle on which come districts are classed Imperial and some Provincial ?—No; there are many anomalies; the Sholapur district, for instance, is Provincial, and it has a lorger area of irrigation then the Ahmeduagar and Nasik districts which are Imperiol.
- 43. Q. (Mr. Higham.)—As regorde these works on the Kadva river, the Waghad tanks, etc., I see that according to the estimate that was submitted when they were constructed they were estimated to irrigate about 8,000 acres; the actual area is about 2,500 acres only. Can you say what was the reason why they fell so far short of the estimate?—No, except that the waste wen has not been raised to its proper height and therefore the Waghad tank does not hold the foll about the desired or pale. calculated supply.

- Mr. Clifton.
- Mr. Clifton. 44. Q. I am referring to oll the works on the Kadva river?—We have had a very bad series of years; the rain18 Dec. 01. fall has everywhere heen very hod.
  - 45. Q. Whot is the present state of the Waghed tank? The waste weir has not been built up to the full height.
  - 46. Q. There is nothing to prevsat that being done?—No; it is being done at present.
  - 47. Q. To what extent will that increase the storage?-I cannot soy.
  - 48. Q. You say that in your opinion black-soil fanot suitable for embankment of tanks; have there ever been any experiments to test the best kind of ingredients for doms? -I don't think so.
  - 49. Q. On the Visapur Tank you are now mixing muram with black-soil?—Yes, in the propertion of 1 in 4; it is based on test experiments made on the epot.
  - 50. Q. In the case of the Weghad Tank, what was the slip due to?—I don't know; the Ashti hauk was founded on insecure soil, which when it got wet was like liquid mud and tho hank sank into it; and at Pashan, n small tank for the Kirkee water-supply, olso we had u slip; now we ors very careful about the base.
  - 51. Q. Do you think that slipping is due to founding on black-soil and not to the quality of the hearting?-No.
    - 52. Q. You have had e good many of these slips?-Yes.
  - 53. Q. Hos there ever been a complete failure of a dam?—The Waghad was ever topped during construction; the Asthi is quite sale new and new holds water, hat not much this year owing to had rains.
  - 51. Q. What are you doing to prevent water-logging in the Poona cane area?—We are taking great precautions now; we are distributing water in rotation and Mr. Visve-varaya has taken great trouble about it; the materlegging is not serious.
  - 55. Q. Is it less now than formerly?—I cannot speak from personal knowledge, Mr. Visvosvaroya tells me that as the case.
  - 56. Q. Are there complaints of water-logging on the Nira Canal?—I haso not heard of any; the country does not lead itself to it; it is on a good slope.
  - 57. Q. Mr. Mollisnn said that it is rather serious on the Kira?—I have not heard of it, it has not come before me in any way.
  - 59. Q. You referred to the Ekruk and the experience gained, saying that these rain-fed tanks will not fill?—Not habitually.
  - 59. Q The Ekruk has always had plenty of water during the late famine f-It was very short last year.
  - 60. Q. I understand you to say that the Ekrnk would have been empty long ago but for the wunts of Shelapur? We have had to regulate its supply.
  - 61. Q. Sholapur depends on Etruk for its water-supply?
    -Yes, we have had to regulate our of crations accordingly.
  - 62. Q. The variations do not seem to have been very great on these tanks. What is the tank enphased to hold? -I cannot my offhand.
  - 63. Q. As you complete these small tanks in Sholapur what will become of them; will they be maintained by the Public Works Department?—I think so in the same way as Ashti and others.
    - 64. Q. And unter-rates will be charged ?- I think so.
  - 65. Q. I suppose these tanks are all completed ?—Only the Patri and Warduner which are nearly completed; the others are in the same stote as the tank at Visapur.
  - 66. Q. There has not been a single case of a tank in Sholapar being begun and completed as a foming work?—No, we cannot put many people on one tank owing to limited space for working.
  - 67. Q. (Mr. Ibbetson.) What are the districts in your division? Khondesh, Sholapur, Poons, Ahmedasgar, and Nasik, all the revenue districts of the Coutral Division in fact, except Satura.
  - 6S. Q. You soy in your note, "there is ordinarily a demand for water in the Decon during the south-west moosoon for perenniol and valuable crops, but not as a rule for cereals for food grains; these latter, given good rainfall, came to maturity without artificial watering." In how many years is there a good minfall in the Decon; putting the last for some next, would it he try ware set of 5.5. the last five years apart, would it be two years out of 6 ?— My recollection is that they lad good erops ordinarily with-out irrigation; I think they had a series of good years.

- 69. Q. You say "the irrigation revenue is for the most part realized in the shape of a crop rate. In the case of the second class works in Nasik and Khandseh in the form of a csusolideted rate." Do you know what proportion of of a esusolidoted rate." Do you know what proportion of that osusolidoted rate is credited to water?—I cannot say.
- 70. Q. You have no opinion as to whother the oredit in sofficient or not, you have nover thought obout it perhaps?

  No; I cannot soy; I do not think it is oxcessive.
- 71. Q. In your division have you anywhere a supply of water realishle for irrigation that is not mode use of?—Yes; on the Mhowwad Tunk we were able to supply 25 million cubic feet which was surplus to the Pandarpur Tank which is a weter-supply tank.
- 72. Q. You were ready to give that for irrigation and no one wos willing to take it?—Yes, this year and last yeor.
- 73. Q Why was the woter not taken?—I caunot soy, oxcopt possibly want of manuro and facilities for irrigation.
- 74. Q. (Mr. Muir-Mackenzie.)—Were there any complaints about the system of distribution?—I have had no complaints.
- 75. Q. Was the srea irrigated hat year as much us in previous years or the supply of water larger than usual, or was the area irrigated smaller, or do you always have a surplus? I can only speak of these two years.
  - 76. Q. Did you hove a surplus in both? -Yes.
- 77. Q. What seil do yoo irrigate from this tank ?-Black soil and reddish, I don't think there are any features in it different from other tanks.
- 78. Q. You don't think it was the soil that prevented people from using the water in larger quantities?—I do not think so; it is the ordinary soil of the Deccan, though possibly the country is more stony than elsewhere.
- 70. Q. (Mr. Ibbetson.)-You have no idea whot the
- SO. Q. Was any effort made to induce the people to use the water ?—I cannot say, the Executive Eugineer, Mr. Godbole, coald tell you.
- 81. Q.—What procedure is necessary when a man wants to take water ?—There is a printed form of application, I think the Mamlatder Issues it to village authorities or it can be obtained direct from the subordinates.
- 82. Q. To whom does the cultivator give it?-To the aphordinate.
- 83. Q. Who is the subordinate?—He is a member of the Public Works Department.
- 84. Q. What does he do with It?-He sends it to the Executive Engineer.
  - 85. Q. Then it is returned to the subordinate f-Yes.
- SO. Q. And then the autordinate lete the man know whot orders have been passed?—Yes.
- 87. Q. How long does that take ordinarily—two months f—I am afraid there is apt to be a little delor, but nothing like two months.
- 88. Q. What does it take in ordinorily ?- I cannot say.
- [With regard to a remark made by Mr. Minir-Mackenzie as to the irrigable area on the Mbaswad tank, Mr. Beale". explained that :-
  - (1) Irrigable area is that portion of the oulinrable area for which there is sufficient water available during the year ;
  - (2) Culturable area is the area noder command to which water can be led from a canal.]
- SP. Q. Did you see much of the irrigated areas during the famine f-I saw a good deal.
- 90. Q. Did you see anything of the wells near canals and tanks; was much good done by them ?--Yes.
- 91. Q. Po you think they were substantially better off than wells ut n distance?—You.
- 92. Q. In restricting the water-apply in Paona and armaging for distribution, have you had any trouble with the people?—No, I understand not, I have personally had very few complaints, Mr. Visvesvaraya is I believe getting the system into very satisfactory working order.
- 103. Q. You say in your note, "In Khandesh and Nasik people with lauds under Lhandards are constantly petitioning for starage works and improvements." Do you thick there is any scope for that?—The Maladari and Chankapur tanks are protective works for those districts.
- 91. Q. There are two instances of what is possible ; has a general survey been made of the sountry to show what

- is possible and what not ?—Investigations have been going on for years and are still in progress.
- 95. Q. You know what is possible ?—Yes, most of the possible sites have been investigated but details have not in all cases been worked out.
- 96. Q. Is much more possible basides those two tnuks is there any schome for the improvement of the bandhard system?—I don't knew if any general scheme is in haud bat improvements are made from time to time as found desirable.
- 97. Q. Have you got all that is possible under consideration, or is there pleaty of room for more ?—I think what has been done pretty well exhausts the means of improvement so far as I know.
- 98. Q. De you know Khaudesh?—Not as well as the other districts.
- 99. Q. (Mr. Rejaratna Mdlr.)—If there is delay in getting sanotion to applientions for water and the rayat irrigates his land before the recoipt of sanction, is he subjected to a penalty f—There is a double rate for taking water without permission.
- 100. Q. (The President.)—You don't require permission every season?—Yes.
- 101. Q. (Mr. Rojarotna Mdlr.)—Is such annual application necessary, do you think ?—Yes.
- 102. Q. Why ?-Because of the varying conditions of the sources of supply.
- 103. Q. I suppose you knew the enpacity of the tank and the area generally irrigated P—If you could depend upon the tank always baving the same contents. One year you can accept a larger number of applicants then another, necording to your supply.
- 101. Q. But taking normal years, why should you wish to have applications overy year?—You get on idea of who is going to take water.
- 105. Q. Would it not be simpler to same the water without fresh applications ?—I don't think it would simplify the procedure very much.
- 106. Q. (Mr. Muir-Mackenzie).—At what date bave applications to be received ?—16th October for rabi and 16th Jane for kharif, I thluk.
- 107. Q. (Mr. Ibbetson.)—In there my date after which a men cannot get water, if he is ready to take it ?—I cannot say. It depends on the anpply.
- 103. Q. (Mr. Rajaratna Male.)—Would it not be eimpler if you had no annual applications ?—I don't know how it would work; if you have your calculations on a normal year and have a had year there will be complications.
- . 109. Q. You say in paragraph 13," the charges for maintenance and establishment are in some cases exaggerated by renson of the same establishment being employed on civil works." Is not the charge for establishment apportioned according to the amount expended P I don't know how the charges are made up.
- , 110. Q. There must be some rule on the subject ?—Yes no doubt.
- 111. Q. (Mr. Ibbetson.)—You said just now that, as far as you know, no special effort had been made to induce the people to take the 25 million cubic feet of water that was surplus in the Mhaswad tank; was the Executive Engineer asked for any explanation why this water was not used in a year of drought?—There was some correspondence with Government; the Executive Engineer cave certain reasons. I forget what they were; Government then sanctioned giving the water to the tank.
- 112 Q. I suppose the Executive Engineer interested himself in trying to got this water used and you as Super-intending Engineer called upon him to explain why the water was going naused?—We have been so busy with the fourluo that there has been very little time for other matters.
- 113. Q. (Mr. Muir-Mackenzie.).—Do you think thet famine labour has been employed as advantageously as it might possibly have been ?—I think so.
- 114. Q. It has been employed on metal breaking?
  —Yes, but we have had to people as much on earthworks as possible; we had to begin with metal rock.
- 115. Q. Why?—Becouse estimates were not really and there was a difficulty in starting other works.
- 116. Q. If estimates had been ready for other work you would have preferred the labour to be employed on them?

  —Yes, for instance railway works and tanks.

- . 117. Q. Is there anything you prefer to see famine Mr. Clifton. labour on rather than tanks, in the special circumstances of your division?—No, I don't think so.

  18 Dec. 01.
- 118. Q. Roads might be more advantageously made in Khandesh?—There is the difficulty of keeping up roads case they are made, I thought of tals or terracing on a large scale at one time, but we had not the establishment. A good deal of this is done by means of takavi advances.
- 119. Q. What is the great objection to terracing?—The difficulty of supervision and about huts and camps; we were hempered by rales about hatting, hespital, etc.
- 120. Q. It would be difficult to make requisite urrangements for large nambers ?—Yes.
- 121. Q. Do you consider those difficulties in superable?—I don't think so; if the question was thought out beforehand I think it might be possible to arrange; digging wells is out of the question, they don't give may work for carriers. I containly think torracing might be tried, it is n very useful work.
- 122. Q. There would be no difficulty on the part of the cultivators in ellowing it to be done?—That is a matter I have not considered, I don't think so.
- 123. Q. They don't make may difficulty about year taking land for bunds ?-No.
- 124. Q. Is the extra expense in addition to that isourred on famine inboar necessary to complete the taaks very heavy?—No. I may say that these taaks are excellent furniae works, at the same time I prefer tals to tanks; we had to consider the question last year; tank sites are very limited now and we have exploited most of them; it is doubtful if we could go much further in this direction; small village tanks have not been tried to any extent and something more might be done in this respect.
- 125. Q. I understood from what you said that the selection of some of these tanks was due probably to the fact that there was no time for full consideration of all the conditions?—Yes.
- 126. Q. There was no time to consider if the tank was one that weald he likely to fill—One had to start work of some kind; the Hotgi, for instance, was one started under such chromatanees.
- 127. Q. How would you remedy this state of things in a fature famine?—I should have a special establishment to proper projects; the Excentive Eagineer cannot do it in addition to his own work.
- 128. Q. You have programmes?—Only for metal breaking and reads, oto., and a few tank works.
- 129. Q. Should not the programme be of works of which the plans and estimates are fully sanctioned?—We have a good many projects not absolutely rendy.
- 130. Q. Deu't you think it would be a good thing to heve them absolutely ready?—We should have a special estab. lishment to propare them.
- 131. Q. You think the best method is to have a special catablishment?—Undoubtedly, there is no question about that.
- 132. Q Have you been lately in the neighbourhood of the Nira Canal works ?—Yes, a fortnight ago.
- 183. Q. Can you say from the appearance of the country the villages and caltivation, if there is a muterial increase in the presperity of the tract?—Yes, most certainly, in the nhundance of the crops and the appearance of the people and overything clso.
- 134. Q. Did you happen to observe the yield of the crops; bew does it compare with the yield on unirrigated crops in a year of good rainfall; do you think it is superior?—I should think it is superior; the bajra and juar are bigher, but it is a long time since there has been normal rainfall.
- 135. Q. Is manne being used for grain and fodder crops?—I should think that where there is sugarcant they probably took agest of the manuro for that.
- 136. Q. That would probably exhaust the supply ?— Yes.
- 137. Q. Coming to the question of applications; I suppose one tesson for requiring applications is that in the case of a canal with a limited supply you must know the number of people who want it is urder to be sure that the water is sufficient?—Yes.
- 138. Q. In the Massad tanks we have a case of the supply not being taken up; why didn't you dispease with applications in that case?—No doubt it might have been

Mr. Clifton. useful but was not thought of; I don't think it would do

as a general principle for these works.

18 Dec. 01. 139 O I the ever when we have a truly from which

- 139. Q. In the case where you have a tank from which the people don't readily take up the water that is to be had, don't you think it might be advisable to dispense with applications?—Yes, I think it might be tried.
- 140. Q. I suppose it is certain that this supply was given to the Pandarpur tank on this account?—I think it was simply enrylns; we had to get the permission of Govern-
  - 141. Q. You cannot recall the reasone?-No.
- 142. Q. Has it over occurred to you that the present system of distributing the water of a canal is ensceptible of any material improvement, or are you satisfied with the system?—I think so at present, Mr. Visveevaraya has laid oot in the rules all the improvements which I think are
- 143. Q. As to the crop rate system of nesessment, are you satisfied with that ?-We have to messure the land, etc.; that is one objection.
- 141. Q. How would you propose to do nway with measurements?—By the introduction of pots or sub-numhers.

- 145. Q. (Mr. Ibbeteon.)—If a part of a onh-number is irrigated do you charge for the whole?—Yes, that is our
- 146. Q. What is the average area of a sub-number ?-
- 147. Q. (Mr. Muir Mackenzic.)—Is that the only improvement you would advocate?—I have not considered the question deeply.
- 148. Q. On the Nine canal, it heing a protective work, every year n considerable amount of water is reserved to be given if necessary to crops that require perennial irrigation; that is you limit the perennial area in order to have a reserve for food grain in case of failure of the rains; do you think that is a good policy?—I think so.
- 149. Q. Do you think that it is essential for mointaining the protective character of the work; is there any other alternstive; it has been suggested by some people that without essentially damaging the character of the work you might let out a larger quantity for personial crops; is it a point on which you have may decided opinion?—No, I have not decided wises. no decided views.
- 150. Q. As regards provincialization of irrigotion revenue and expenditure, that is not a point on which you have formed an opinion?—No.

WITNESSES Nos. 47 AND 48.—Mr. RAMCHANDRA ANANT MODAK, Supervisor, and Mr. Sadashiv, Vishwanath Vaidta, Overseer, Public Works Department.

Answers to printed questions.

### A .- GENERAL.

- Modak and Sitira, Malegaon and Kalwan Talnkas. We bave been serving in this district respectively for the last three and nine years. Both of no had charge of Kadwn Canal Subdivision for parting parieds. division for varying periods.
  - 2. Three statements of rainfull are attached hereto, two of them relate to famine years 1896 and 1899, and the third gives averages for the whole period for which information is available.
  - 3. (1) None, so far os tracte requiring irrigation are con-
    - (2) No insufficiency of cattle.
  - (3) Irrigators are unable to obtain an adequate supply of mannro with their limited means.
  - (4) Excepting hill tracts and black-cotton soil portion, in the eastern part of the district the soil is fit for irrigation.
  - (5) Yes, in case of bandharas, which are clossed as Second Class Irrigation Rerenuo works.
  - (6) No luck of funds in general. Given a good watersupply, credit can usually he got.
    - (7) None that we are aware of.
  - (9) The section of canal, as designed, generally proves insufficient to pass down an adequate discharge to simultaneously irrigate all crops in the trust under command. This retards growth of irrigation to a certain extent.
  - No, the area under irrigation being small as compared with the oulturable area of the district, irrigation nowhere extends at the expense of jirsynt cultivation.

No such inctances have come to our notice. The people have a strong desire for irrigation being extended to their fields.

## B .- CANALS OF CONTINUOUS FLOW.

The works under this class are assumed to he those cannie which are fed directly by river throngbont the year. There are no such canals in the district.

# C .- CANALS OF INTERMITTENT PLOW.

- 12. (1) The works under this head consist of cauels fed by rivers and natlahs, and taken off from small weirs thrown across them.
- (2) Water is distributed through obanuels by gravitation, and hy lift in a fow cases.
  - (3) Supply is mainteined-
    - (a) to end of February or March.
    - (b) to end of Novomber.
    - (c) only for a short period.
- 16 Irrication is supplemented by wells in years of ordinary rainfull in the case of many bandharas. These do

- not hold a sapply sufficient for the manurity of the orops, Rice and oimiler crops, under bandhards, requiring waterings after every four to six days, need well water also, as the supply from the channel is often irregular. In case of chillies and khapla wheat well water is said to be more heapfield. beneficial.
- 17. (1) In this district Government is the owner of such causis, and the annuel rate per sore works out to Rs. 4:42 on the area of holding.
- (2) Rs. 15 to 25 per acre as rent on the area under agree-
- (3) Not koown.
- (4) There are no such canals, as are owned by private persons, to our knowledge.
- 18. Private expenditure for bringing water to, and preparing, a field, is rarely incurred by landlord, but mostly borne by the tenant, who agrees to pay the rent inclusive of this. It is difficult to estimate it, as the tenant rarely employs hired labour. The landlord has sufficient security for recorpment as the bond for rent includes the fulfilment of other obligations.
- 19. In no case damage hes resulted to people on this account, but deterioration to soil has taken place in tracts, rich in back-soil, and in other fields, having insufficient manure, but profuse irrigation. The evil may be due to one or more of the causes, usually injuring the quality of the soil. So far us we know, lends have not been drained for removing the evil.
- 20. It is obligatory on the part of the irrigators to maintain their channels, hanks, etc., in good order by sunnal repairs. Repaire and improvements to bandhards are carried out by Government, 10 per cent. of the cost being contributed by the irrigators. All the bandhards do not require repairs annually. The average annual expenditure incurred on their account (including contributions) was Rs. 13,000 up to 1890, and Rs. 4,500 per annum onbsequently.

The system works fairly well, but is susceptible of im-The system works fairly well, but is susceptible of improvements by a greater expenditure of funds. The obligations entailed on the irrigators are not carried out daily, which thereby readers the channels inefficient. The procedure to be followed, as per Section 25 of the Irrigation Act of 1879, involves considerable delay, which causes wastage of water and thereby loss of crops. To prevent this cyll amendment in legislation is necessary to allow of immediate steps being taken. amendment in registrerendiato steps being taken.

22. Yes, in case of these minor works, by lending money, guaranteeing interest on capital, or hy paying the owner a certain fraction of the water assessment.

23. (1) The only tanks in the Nasik District is Waghad Tank, which is supplied with water from Kolwan river.

- (2) Water is let out from this tank, into the Kolwan river, letding to the Palkhel Weir, 14 miles distant. It is further taken off for irrigation through the Palkhed Canal, which feeds the Ozar, Tambat and Wadali Canals, all having distributing channels suitably located.
  - (3) Supply is maintained-
    - (a) throughout the year.(b) to ead of March.(c) Do. Do.
- (4) The several crops irrigated under the Kadwa Canals system, with present storage of Waghad Tank, rarying from 202 35 to 3.8 95 mill. cubic feet, are, on an average for the lest 14 years (as per statement attached):—

						Acres.
Perennial .		1.	•			355
Eight months				•		926
Rabi .			•			1,074
Merseen dry		•	•			149
Het wisther		•	•	•		84
Mirc. Hancous	•	•	•	•	•	51
			To	TAL	•	2,639

23. Irrigation is very rarely supplemented by that from wells in crainary years. Wells are, however, necessary in years of drought or scanty rainfall. They are particularly necessary for preserving seedlings of perennial crops requiring transplantation.

- 25. The average annual rate paid on area irrigated by Messes. the Khdwa Canals system is :-Vaidva.
- (1) Rs. 372 as average water-rate per nero on the ares cerually irrigated,
  - (2) Re. 15 to Re. 25 per sero as real on area irrigated. 18 Dec. 01.
- (3) No cahancement of revenue is paid on area irri-cated by causis and assessed at water-rates, but on lands deriving benefit from water stored above the Paikhed Weir; the enhancement of Rs. 591, in total, per annum for portions of seven villages is paid.
- 29. Reply to question 18 holds good in this case.
- 30. The tank and causle are maintained and repaired by Government at a cost of about Rs. 1-3-0 per nere irricated, including direct, executive charges, and tools and plant. The system works fairly well, but the punishment indicted for any breach of causl rules, such as taking nater without permission, results only in fines, and therefore does not prove deterrent. This results in injury to other cultivators having prior claim.
- 82. Constinction of tanks should remain in the hands of Government as heretofore.
- 33. No inconvenience has yet been experienced in this district from the liability of tanks to silt up.

### E.-WELIS.

34. The following table gives the required details for

,		Nature of tracts.	
Question.	Hilly.	Partly hilly and partly plain.	Plaia.
2	3	4	5
1700	Rs.	Rs.	Rs.
Avorage depths of permanent wells . The nature of supply, whether from springs or from percolation, and whether liable to fail, or become	Abont 45'. From percolation	About 40'. From percolation and springs.	30' to 40' From springs.
(a) in ordinary years (b) in years of drought Avorago coet of construction	Supply fails, 1,000 to	500 to	600 to 800
Average duration of a well Manuer in which the water is usually raised. Average area attached to and commanded by a well.	Over 100 By 7 to	years. motes. 10 acros.	1 to 3 acres.
	Avorage depths of permanent wells  The nature of supply, whother from springs or from percolation, and whether liable to fall, or become too saline to use.  (a) in ordinary years (b) in years of drought Avorage coet of construction  Avorage duration of a well Manner in which the water is usually reject.	Question.  2  3  Rs.  Avorage depths of permanent wells.  The nature of supply, whether from springs or from percolation, and whether liable to fail, or become too spaling to use.  (a) in ordinary years (b) in years of drought.  Avorage coet of construction.  Average duration of a well.  Manuer in which the water is usually raised.  Average area attached to and commanded by a well.	Question.    Hilly.   Partly hilly and partly plain.

- ! 37. (1) Rs. 5 to Rs. 10 per acre as rent on the area attached to the well.
- (2) None. Rates are paid on the total area attached to the well, and not on actual area irrigated.
  - 38. Yes.
- , (1) To some extent.
- (2) Difficulties are rarely met with in the actual construction of wells, except in the transport of explosives, which, according to standing orders, cancer delay. Slight relaxation of these rules may therefore be effected. No assistance to cultivators in the manner referred to appears to have been given in this district so far as we know. It would therefore be advisable to keep a certain number of boring apparatus in each district for the use of cultivators, guaranteeing cost of repairs.
- 39. It may be shown that ultimately the cost of irriga tion works per none of area irrigated by a canal and of that

by a well, practically comes to the same amount. Wellsby a well, practically comes to the same amount. Wells, therefore, if constructed by Government, in tracts yielding water at reasonable depths would be more beneficial, as those do not injure the quality of the soil. It would therefore be advisable also to advance money at a low rate of interest to persons risking their private capital and guaranteeing the repayment of the advances. Experiments may be carried out by Government in sinking a few wells at Government expense. If the results prove beneficial, Government may in future pay in part the cost of construction for new wells; the rest to be borne by the interested parties. Expenditure so incurred by Government may be recovered Expenditure so incurred by Government may be recovered by instalments later on .

40. Temporary wells are not in common use in this district. Their protective value is practically nil against drought. If they are to be of use in years of scanty rainfall, they should be deepened in ordinary years and maintained till years of scanty rainfall.

Mouthly Statement showing Rainfall during the Bamine year 1896.

- 1. Q. (The President)—You are a Supervisor in the Public Works Department ?—Yes.
  - 2. Q. Where are you stationed f-At Nasik.
- 3. Q. You say in your answer to question No. 3, "the section of canal as designed proves insufficient to pass down an adequate discharge to simultaneously irrigate all crops in the tract under command. This retards growth of irrigation to a certain extent." Will you please explain that; do you refer to canals in general?—Yes, the section is not large enough. If the section were larger we could give more water for a shorter time instead of a small and environment supply. Lontinuous supply.
- 4. Q. That only applies to where you have a tank or reservoir behind you?—Yes.
  - 5. Q. It would not do for a bandhará ?-No.
- E. Q. What works have you got ?- In my charge there is no irrigation work; there are only some bandhards.
- 7. Q. You have no canals or tanks under you !- No.
- 5. Q. Where was your experience gained?—I was in charge of the Kudwa canals in Nosik.
- 9. What had you specially !- The Mhasnad tank in Sholapore.
- 10. Q. What area was under irrigation then !-- I think in 1898 there were about 12,000 acres.
- 11. Q Is the system of applying for water in vogue there?-Yes.
- 12. Q. They are not allowed to take it without canction ? ---No.
- 13. Q. Are they fined if they do P-Yes.
- 14. G. After a man has cout in an application, when does he get a reply?—It takes about a mouth; in urgent

- cases permission is given as soon as the application is Mr. Modak. received in the Sub-Divisional office. 18 Dec. 01. 18 Dec. 01.
  - 15. Q. Is it refused over ?- Very seldom.
- 16. Q. Do you think it is necessary to have an application ?-Yes, otherwise anybody would take water.
  - 17. Q. But there are Inspectors to look ofter it ?-Yes.
- 18. Q. Do you think people would take irrigation more readily if there was no application required !—Yes, but it would not pay.
- 19. Q. Have you had experience of more water than you know what to do with ?-No.
- 20. Q. Was the whole of the Minswad tank water taken in 1696?—Yez.
- 21. Q. (Mr. Muir-Mackenzie)—Was not some given to the l'andarpur Municipality ?—Not in 1896.
- 22. Q. (The President)—You say in paragraph 20, "it is obligatory on the part of the irrigators to maintain their channels. banks, etc., in good order by annual repairs. Repairs and improvements to band hards are carried out by Government, 10 per cent. of the cost being contributed by the irrigators." Is that rule about 10 per cent. regularly in force?-I think so.
- 23. Q. Suppose a cultivator refuses to pay, what then, is he put in preson Y-I am not aware of such a case like that; I have never heard of a mun refusing to pay.
- 24. Q. Then you go on to say, "the system works inirly well, but is susceptible of improvements by a greater expenditure of funds. The obligations entailed on the irrigators are not carried out duly, which thereby renders the channels inclicient." Will you explain what you refer to? The silt is not properly cleared in time and therefore the discharge is interfered with.

- Mr. Modak. 25. Q. Do your overseers or subordinates look after the work when it is being done by the villagers ?—No.
  - 26. Q. In there anybody to see to it ?-No.
    - 27. Q. They are left to themselves F-Yes.
    - 28. Q. How do they know what to clear ?- They clear away the soft silt.
    - 29. Q. Havo you had nnything to do with the Waghad tank? Very little; I only once saw it.
    - SO. Q. You say on page 4, "difficulties are marely met with in the actual construction of wells, except in the transport of explosives." What do you refer to ?—Gunpowder.
      - 31. Q. Is that difficult to get in villages ? Yes
    - 32. Q. You say on page 5. "It may be shown that ultimately the cost of irrigation works per nere of nea irrigated by a canal and of that by a well, practically comes to the same amount. Wells, therefore, if constructed by Government in tracts yielding water at reasonable deptire, would be mare beneficial as these do not injury the quality of the soil." Do you think Government should construct a number of wells?—Yes, at least to begin with, to show the people how advantageous they are and how they simuld be made
    - 33. Q. Do you think the number of wells might be increased very largely? -If takari advances are given and the rate is reduced.
    - 34. Q. Is there any difficulty about takavi ndvances?-There are some delays.
    - 35 Q. Do you titlek more advances would be taken if it was unde easier?—Yet.
    - 36. Q. How would you suggest to do it?—By showing the record the record to bore for water; by spiceding the recovery of odvances over a larger number of years; and by reducing the rate of interest.
    - 37. Q. Do the people complain of the interest charge on advances ? - I have not heard them.
    - 39. Q (Mr. Higham)—Applications for naturate pot made in the case of Landhards !— No.
    - 39. Q. On what works are these applications made?—Only on 1st class works, as in the cross of the Kadwa river work«.
    - 40. Q S ipposing a number of owners made an application orce for all, and they be able to distribute the supply among themselves every year without application;—I don't think so; The area and the enquand their location in a particular surrey number often wary from year to year; therefore applications received one year example serve as a guide for regulating the supply next year. The culticators are moreover scarcely able to make a common cause.
    - 41 Q We clear the channels now "-No, not in the numor distril aunres.
      - 2. Q Are you speaking of the Radwa const ?- Yes.
    - 42. Q He p opic have to clear their minor distributance f-Yes.
    - 44. Enproving a number of the members of a village asked for water, would they not be able to take mater without going every year to capai officers and to make their own orrangements for its distribution in the same way as people do on Landhdrais!—That has not been tried apprehen. anruhere.
      - 45 Q. Do the people clear their bhanddras?-Yes
    - 46 Q. Then why doo't ricy clear their minor channels?
      —They don't on matter of fact do it; wien applications are received and the channels are in bad order we issue a forinight an iter that the water will be stopped and then stop the su; piy if the channel is not cleared.
    - 47. Q. Do they clear it after they get n notice of that sort ?- 1 cs. generally.
    - 48 Q. They clear it if they want the water and don't if they don't want the water !-Yes.
    - 49. Q You say repairs and improvements to bandhards are carried out by the Government, 10 per cent of the cost being contributed by the irrigators i—Yes.
      - 50. Q. They also have to do their petty regains?-Yes.
    - 51. Q. What are the works that Government do ?-Such improveme, ce as escopes, etc.

- 52. Q. And they always take 10 per cent.?-Yes.
- 53. Q. Do you think that cannis injure the quality of thosoil ?—Yes. By water-logging; it gradually becomes useless for cuitivation.
- 51. Q. Has any land gone out of cultivation ?-Yes, in the Kadwa canal system.
  - 55. Q. What crops do they grow there !- Dry erops.
- 56. Q. What dld they coltivate before in the land that has got water-logged? -Ordinary crops; the outturn ic very poor.
- 57. Q. Is that due to want of manner or excess of water? Probably to excess of water.
- 58. Q. Where there is well irrigation there is no danger?
- 59. Q. (Mr. Rajaratne Mdlr.) -- Referring to the system of applications for water, in whose does the rayar apply? -To the Inspector and then it goes to the Sub-Divisional office.
  - 60. Q. And then to the Executive Engineer ?-Yes.
- 61. Q. Is there my time fixed for presenting the appli-
- 62. Q. No time is fixed ?-No; I think they should be submitted a fortnight before the u-cossity for unter arises. It is never rejected, unless there is no water.
- 63 Q. Then what is the necessity for the application? -Anybody might take water he one year he might have one acresy number and then it may change; in one year he might have one crop, in another year another.
- 64. Q. How do you regulate the quantity of water re-quired?—By accertaining the total improximate orea of the various crops under irrigation, and by calculating the quantity of water required.
- to. Q. Are the rayate presented if ther irrigate before rangetion :- 1 have not heard of that being done; we are a double assessment, that is all.
- 66. Q. (Mr. Muir-Maclensie)—Is that possity often imposed !- les, it is to be imposed in many - hes, it is to be imposed in mony cases, at hast in famine years, searc-if in normal years,
- 67. Q. (Mr. Rajaritan Milr.)—Hid you any experience of the last familie year?—Yes.
- '8 Q. On what work?-On the Mhasead lank in Spolaput,
- 60 Q On the Markal tank the working expenses are Rs. 18,000 and the revenue Rs. 19,000; why are the worling expenses so high?—The rapid is so scattered.
- 50 Q. In that tank the duty is only 52 acres per cubic first per second, may is it so how as computed with other works i-The religation is very scattered, and there is a great deal of percols on and maste in travell.
- 71. Q On page Sat the rad of paragraph 20 you say, "to prevent this eril amendment in legislation is necessity to allow of immetia's steps being taken." In what direction? —Test notices may be disposed with—canal water being stopped at once.
- 72 Q (Mr. Muir-Markenzir)—Was the Mha-rad tank ever quite full in your time !—Ves, it was full in 1996 and floods passed over the weste-weir.
- 73 Q. Was it capable of irrigating the full 218:0 a-res? -No. 12.000 acres were irrigated.
  - 71. Q. The water in the tank was not sufficient !- No.
- 74. Q. In 1801-95 what was the state of the tank?-It was full.
- 73. Q. Why was water not taken then for 12,000 acres ? -It was perlaps a little less.
- 77. Q. The average is only 5,000 a yes . Why is so little nater taken !- Perhaps the waste weir was reduced.
- 78. Q. In eight years the average amount irrigated was 5.0.0 neres F-1 think the lowners of the area was due to lowners of the westerweir; besides there is great leakage
- 79 Q. In ordinary years is all the water available taken ? -Not much remains at the end, as far as I remember.
- 80. Q. You don't tidink there is any reluciance on the part of the cultivators to take the available nater in an ordinary year :- No.

- \$1. Q. What was the first year you went to the Mhaswad tank?—In 1895.
- S2. Q In that year only 3,400 acres were irrigated, why was that?—The waste-weir was low.
- '83. Q. Was all the available water taken !- I don't remember.
  - 81. Q. (Mr. Ibbotson.)-What is the depth of the black-
- oil which you irrigate from the Mhaevad tank?-Perhaps Mr. Modak. 1 to 3 feet. 18 Dec. 01.
  - 85. Q. It has muram underneath f-Yes.
- S6. Q. When you speak of the leakage, do you mean that your channels cut into the muram or that the soil takes more water ?- Both.
- 87. Q. In 1895-96 the level of the waste-weir was low; in the subsequent year the area was more than double?— Every year two feet was added to the waste-weir and so it was gradually built up.

# WITNESS No. 49.—Sadashiv Vishwanath Vaidra, Overseer, P. W. D., Nasik.

- 1. Q. (The President) .- You are an Overseer in the Public Works Department P.- Yes.
  - 2. Q. You are stationed at Nasik ?- Yes.
- 3. Q. Have you had charge of any tanks !- I was in charge of the Kadwa Canal Sub-Division for soven years.
- 4. Q. Haw much had you under the canal?—The average is from 2.000 to 3,000 seres.
  - 5. Q What is the soil !- Blackish-red.
  - 6. Q. Not deep black cotton sail ?-No.
- 7. Q. Have you had the Waghad Tank under you?-
- S. Q. Do they send in applientions for water in your parts ?-Yes.
  - 9. Q. Is that necessary f Yes.
- 10. Q. Is the water all consumed, or is there more water than you require?—At present the tank is not fully developed, it is mostly consumed.
- 11. Q Do you think if the tank was fully developed there would be too much water?-Almost all the storage would be consumed
  - 12. Q. The water is taken every year ?- Yes.
  - 13. Q. Does it go into any small tanks !- No.
  - 14. Q. If you want to protect the place from famine

would you make wells or a canal ?- If there is a possibility

of ninking a conal, it is better then wells.

Paidya.

- 15. Q. Yen say in paragraph 39 of your Note " Wells therefore, if constructed by Government in tracts yielding water at tensonable depths, would be more beneficial, as these do not injure the quality of the soil." What is the injury to the quality of the soil from canals ?- Under cann's irrigators use too much nator, which washes away the beneficial soluble salts in the soil.
  - 16 Q. Could you not put any check upon that? -No.
- 17. Q. Do you think Government should make the wells?

  No; they may help the irrigators to make the wells by takavi advances.
- 18. Q Do many apply for these advances now?—S. far at I know very few, probably the conditions of taken do not snit.
- 19 Q What is the difficulty ?-They should be allowed a langer period to return the instalments.
  - 20. Q What would you like ?-About 10 to 20 years
- 21. Q How lang do they get now ?- I am told only ten years
- 22 Q. Do you think if it was made 20 years many people would apply ?-Perhaps.
- 23. Q. Is there may other way in which it could be made more popular ?-Not as far as I know.

WITNESS No. 49.-Mr. GARESH SARHARAM KHARE, Sub-Engineer, Malegoon, Narik Distric'.

# Memo, by Witness,

The following report refers to Pinpalner, Dhalia, Sind-kheda, Amalnor, Sindhada and Nondurbar tsinkas of the Khandesh Collectorate, and Kalwan, Baglan and Malegson talukas of the Nasik Collectorate, and is made by Sub-Engineer Mr. Gapesh Sakharmo Khare who had the apportunities of processing and appearance of non-cours in the discourse of the contractions of the contractions. tunities of personal experience of alor years in the district during his service in Kasadesh Iragation.

In the first place I beg to bring to notice that in giving the following information I have limited myself to the only question of old Irrigation in the district

In these parts the rivers and even small nallahs have perennial supply of mater which is picked up by the construction of small masorry dams called locally "banakiras" for a too chancels, varying from a few hundred feet to three for which channels, varying from n few hundred feet to three miles; are constructed and lands belonging to one or more villages are irrigated. Irrigation on a large scale on any one channel is not attempted. The total area irrigated by the shore system is nearly 25,000 acres, bringing in a constituted revenue of hand and water shares amounting to Rs. 2,02,000, of which Rs. 33,000 is lead share and Rs. 1,70,000 water share. Instances of two rivers, viz., the Area and the Vanna are taken to show the quantities the Aram and the Musam, are taken to show the quantities of water which have been taken advantage of, by the system of these bandhords. The catchment area of the river at the last handhard on the Aram is about 170 square miles while the irrigation on the same is 2,376 acres, of which nearly one-fourth is high class irrigation of sugar-cane. Ordinarily six acres are taken as irrigable for every million cubic feet of water stored up in a reservoir, which can be kept under control.

In the present case the area is irrigated by taking advan-tage of the storage as it were, of underground springs. It would not be inneh out of the mark if I take that for every three nores irrigated one million cubic feet of water

By this assumption a storage of about 800 millions cubio fire of water is required for the irrigation of these 2,375 nerss in a catchinent of 170 square miles. This is equal to ners in a catchment of 170 square mices. This is equal to the storage duot on ron-oil of two inches on the above eathermost. Similarly the Mosum has a catchment of 380 square miles at the last bandhard and the area irrigated is 5,803 acres and this at three acres per million cubic feet would be equal to a storage of about 2,000 million cubic feet, or

equal to a run-off 22 inches over the eathment as utilized. It will therefore be seen that the soil along the tributaries of the Topti taking their rise from the Western Ghats has a or the 10pit taking their rise from the Western Gluss has a terry great power of absorption and retention of the rains. It follows therefore that the soil in Khandesh Irrigation Dienici is in great contrast with laterite soil, which absorbs much water like a sponge, but et the same time gives it out immediately without ietaloing it in its interior, also not like miram soil which has less power of absorption, nor like black cotton soil which has been water in few feet halor spacement, but does not soorting to in few feet below surface only, but does not contribute to underground storage. These handhards and channels seem to have been constructed when Mahnwedons were the released Khanile-h Dieric', and in making these channels good many tunnels through yellow soil have been constructed, which seems to be a peculiarity of Mahomedan construction, as may be seen in the water works of Mahomedan and the seems to be a peculiarity of median period made at Junuar, Amangabid and other

It will be seen that now-a-digs whenever any water work for a town supply or irrigation purposes is contemplated, a tank or a reservoir drawing its storage from surface water is generally first thought of. So during Mahomedan times taking advantage of underground storage seems to be their first consideration. They have gone even to making conduits from underground spring-ter purposes of irrigation as may be seen from the "Hapistag" conduit near Junnar supplying water to under 30 arres of irrigation made by an Abyssinian since of Chand Bibi of Ahmednagar dynasty.

Absorption is looked upon as so much loss to irrigation and no doubt it is so to the overground reservoirs, but for underground reservoirs it is so much gain. Anything done to increase absorption will help these works.

It would appear to a superficial abserver, seeing sa much underground so, ply in the vicinity of towns like Dhulia, that tapping underground supply would have perhaps given a briter filtored supply to the town. And it may be seen if it is not passible to come nerosa a safficient supply for Malegaon and other towns in the bashs of the Penjhara, the Mosam and the Girna Rivers, if water works are to be proposed for them.

Mr. S. V.

18 Dec. 01.

Mr. G. S. Khare. 18 Dec. 01.

Mr. G. S.

Khase.

The Mahemedan Rulers did not stop by constructing works for utilizing underground water, but they tried to construct tanks also, but failed in the attempt. No less than 30 tanks were constructed in Nandurbar Taluka olone, but all of them have breached.

There are a large number of hills near Nandurbar and other places south of Tapti which run parallel to each other and at right angles to general drainage of the country giving passages to all the rivers and nallahs, large and small. The genges are very narrow, and large tanks can be constructed at a very small expenditure. The difficulty is about waste-weirs and the failures of so large a number seems due to this related than any other state. to this rather than any other cause. These hills are emi-cently suited for the construction of tanks. A look at the topographical sheets of Nandurbar, Dindia and others will show what a large another of tanks are possible. The old tank of Gondar is near Dhulia on this port of range, so was Wadi Bhokar Tank, which breached after the floads of 1898. Sand Phokar and, constructed in the last famine, is in the same sort of hills, so are the proposed tanks like Dudhala, for Nandurbar unter supply, Chopala and Raitel tanks. A

- large tank in Kathlawar, I am told, has been constructed in the same sort of hills. It would be worthwhile to consider the restoration of the old taoko and construction of new tanks. It would increase the direct irrigation and also indirect irrigation and also new trans. It wood increase the direct irrigation and are indirect irrigation by increasing the underground supply. Large tanks will do much good, but small tanks would be useful as small famine relief works.
- Forests are a great help to the old irrigation work by preventing denondation and by increasing absorptive quality of the ground, but their utility may considerably be increased by constructing small tanks not so much to hold water but to improve the forest land. This would give great work to famine labour on small scales. This would prevent the washing away of rich moold propared by the great agustes of the san and the atmosphere during the year. Absorption will be increased as rain water will tarry a while before it finds its way by the waste-weir provided, and the greath of forest will considerably increase on the new reclained area. I would go so far as to propose making temporary tanks of Mr. Strange's design with small ontless discharging in 24 hours whatever run-off has been gathered in the tanks in a couple of hours. in the tanks in a couple of hours.
- 1 Q. (The President.)-You are Sub-Engineer of Molegain :-Yes
- 2. Q How long bare you been there :- I've about nine
- 3. Q. You say you confine yourself to the question of old remarkon f = Yet.
- 4. Q. That is to say wen have but nothing to do with recont irrigation?—No. I have been for the last nine years making small projects and looking after repairs of old irrigitton norks.
- 5 Q You say "collinguly ely series are taken as freignable for every million cubic feet of water stored up in a reservoir. Ho you ear that from your can electration?—
- 6. Q. You say " in the present easy the area is lerigated by taking advantage of the etergo, as it were, of underground springs." Do you man the fundhard system it. Yes.
- 7. Q. Then son soy "it would not be ruch all the morth if I take it that for every tunce times impost benemialish author feet of material media. I - hear to the goes to make a where some had could be impated by that water.
- S. Q. Where does it up to ! Is it not picked up he a landland hear down !- Up to Neventher a recentive it is not picked in, it goes to waste. In Herender and Japaners to pupile generally also their landlands.
- 5. Q It g es to waste become they 4 not want it !-
- 10. Q. Poglislan t wir imanifectel to be enter? -Romatereigig vang satte ibite landbarde.
- II. Q If their did not close thore, could they not outply mater to more land? Yes, they could
- 12. Q. They do not care to "-- No. Tecame they cannot usuate high class cops.
  - 13. Q And they do not imput jour !- No.
- 14. Q Catten? No. They impate fast thee accordly engagence, thirdly wheat and afterwards hajri.
- 15. Q. Do yet think it would be of any nee giving them more nater, if they do not eare als at it is. We might try.
- 16 Q What Lappened when the rife falle if Tier ttak water for grain crop.
- 17. Q. Did nice surfly very much mater in Nicht during il e famire !-Yes.
- 18. Q. What do you think is the best thing for Government to do to protect the district against another famine?— To some places I would be noticed orizate in works. The some receive would telp the Mel Lain tali,ka
  - 19. Q. Would the profestate mater ?- Yes.
- 20. Q. Let eay they do not over fer irrigation except for high ches coper.—They irrigate high class crop entirently hat they take it for primerops when these is drought.
- 21. Q What are the high class crops they cultivate ?-In the Nasik Collected early early year at exceptions exist. e-could year sugarcane, thinky our select and then hajri.
- 22. Q. What is the grey extion, I alf of wheet and Enjoy? Lee It is a quality to take in.

- 23. Q. You do not call bajri a high class crop ?-No; neither wheat.
- 23 Q. You think the extension of irrigation would help them !- You
- 25. Q. What area is there in Nasik that is irricable, there roany acres ?- I have not got the statistics.
- 26. Q. Could you irrigate one-fourth of the district or nestenth?-One-tenth, most of the Lifty portion cannot be cultivated.
- 27. Q. Do you think that that would belo very much in times of famine? Yes. There was a great difference in the sufferings of the arrigated and non-usigned villages.
- 2. Q (Mr. Hipforn)—Yen say "similarly the Moram has a catchinent of 380 square miles at the list foundated and the arm impated 3. so acres and this at 3 acres per million cubic feet mulities e pul to a creage of atomic form million cubic feet i—Yes.
- 2.4. Q. That is the quantity of water stored in the tank?
- (0) Q. It is supplied ented by a further expely from the springs in the exerted by the personnal flow of the river?

  We have two exercises to the care, but principly in tanks like the Albaral there is no flow.
- 31. Q Is not a great deal of interation done by the few of the river before the river falls without grawley on the sterage tank !- Yes,
- 32. Q. They do not draw water from the propage tank antil bot do not November !- In small tanks they do not in the more could there he authorism water; but not from tanke which use n tifel by n fer mial etrears.
- 5%. Q. topinein; a tian mante to make a rem landlieit below an entering one, is he allowed to its so ?-Treee las ber no of priling made, at least as far as I know.
  - 11. Q. No new bin Ildras are note?-No.
- 15. Q. Them binthindrare eldens ?-Yeuther were milen big time ego
- of Q. Sup; we when you come to the lower bundling there is a lot of water waning over, can any buly pick up that notes i -1 do not are any objection to that.
- 17. Q. Supp sing any one manted to make a new dam to first it up, is there in alling to prevent him i-No.
- 18. Q. Do you know of such a case ?-No.
- 22. Q. Init terms there is no water to pick up or because it is not the custom f-Because they connect spend somethmency on landfibris.
- 40. Q. Are there my plane at which, if they could so not the more, they reject to able to pick up more water?—There are a few place on the Panjin. Near the Atum river there is a banching. the water to protter nal'alt from it.
  - 41. Q. P. th these rivers have surplus water? Yes,
- 42. Q. All through the year f-The Arara Las all through the year.
- 43. Q. You may short Nandmilar there is a rib for a tink f—Yer. There are publish bills at right-angles to the water coarse.

- 44. Q You speak of a great many tanks made by the Mahomedans in the Nandurbar taluka being breached ?— Yes, and rendered usoless.
  - 45. Q. Why ?-For want of a waste woir.
- 46. Q. It is quite possible to make new tanks there ?-
- 47. Q. Could those old tanks be repaired !- Yes; estimates were made by Lieutenant Hart some years ago but the work was not carried and.
- 48. Q. No tanks have made up recently P-No, only the Talwad tank was made in the last famine; it was an old tank re-made.
- 49. Q. Are there any land numers in this district who make tanks themselves !—I do not think they are rich eaough in build tank.
- 50. Q. (Mr. Ibbetson.)—Ym speak of underground storage tunnels ?—Yes. There are many tnanels which are underground. There is one at Jagakhad they have limed it; I do not know when it was made. Perhaps shortly after the British conquest.

- 51. Q. What is it supplied from !-From the Masal Mr. G. S. liver.
  - Rhare.
  - 18 Dec. 01.

18 Dec. 01.

- 52. Q. How did they come in msko underground tunnels?—The bank is so high that instead of making an open channel they have made an underground passage in the yellowish soil.
- 53. Q. You say tanks one be easily made at a very small cost f—I think so.
- 54. Q. Do you think the people will use the water ?-
- 55. Q. Would they have used it before the famine or will they use it as a lesson from the famine ?—Tanks have besn used for irrigation purposes for a long time.
  - 56. Q. Only very few P-No. Almost thirty tanks.
- 57. Q. Why has not Nasik been covered with small villago tanks if the people are used to irrigation ?—I cannot Estimates were prepared for the construction of villago tanks.

# WITNESS No. 50 .- Mr. RANCHANDEA CHINTANAN KHARE, Pleader, Shirpur.

# Answers to printed questions.

- 2. (a) As to gross and culturable area in the district of Khandesh, I cannot give definite figures, as I have got no statistical registors with mo.
- (b) Khandesh soil is on the whole a good soil, though it cannot be properly described as rieli black leam. The soil is not generally meist for want of sassicient rains. It has got, however, a great power of absorbing and retaining moisture.
- (a) The average rainfall por year varies from 15 to 30 is ones.
- (d) The seath-westerly mensoone give but scanty rains, and artificial irrigation is found a accessity.
- (c) Wheat, gram, rice, bajri, plantain, and sugarcane generally require irrigation.
- (1) Wheat and rice crops require watering overy eighth day. Sugarcano requires it every fourth day and bajri every fifteenth day. Of coarse this rale varies, as the capacity of the soil to absorb moisture is greater or less.
  - (g) Gujarat has generally insufficient ruius.
- (A) As a rule the cultivators irrigate their garden lands all through the year. Some crops, however, only require watering for about four months from October coward.
- (i) The distribution of water is controlled by the Government officers specially appointed for the purpose. In years of drought the canals dry up, and crops consequently suffer a good deal.
- 3. (a) Small tanks may be constructed an Khandesh soil, and carthen doms without mascary work would do when the extent and the size of the tank are not very great. Khandesh soil is not very rich, and hard seil can be got nbout 4 or 5 feet below the surface. A dam about 7 feet in height with stone-pitching nu the surface is sufficient to hold water.
- (b) In Khandesh land requires artificial irrigation oven in good sensons, for generally the rainfall is insufficient and scenty. Besides all lauds necessarily require artificial irrigation from October onward, and Government is not at all likely to suffer, from financial point of view, owing to elack domand for canal water.
- (c) All land-holders of black soil are desireas of having an irrigation work on or about their soil, and they are sare to take the best possible advantage of any tank that might be constructed un or acar their hads.
- 4. In Shirpur taluka of the Khaadesh district there are many sites where canals might be conveniently constructed at a comparatively small outlay. At Kervand in the said taluka the site is a grand one, and a tank constructed there will provide water to the whole taluka. Plans and estimates are already made and the project has been approved of by Govornment.
- To questions 5th and 6th I cannot give any definite answer for want of statistical information.

- 7. (a) Although in a famine year the number of wells Mr. R. C. increases, the total area irrigated is less than in ordinary Khare.
- (b) I cannot give exactly the number of wells constructed in the last decade, nor can I specify the cases in which Government help was given.
- (c) It is certainly desirable that Government sheald encourage in all possible ways the construction of new wells and should advance tagai in cases where it is found neceseary.
- (d) In the years 1899, 1900, and 1901 the rainfall was insufficient, and the consequence was that many wells got dried up and the people had to abandon them.
- (c) In Khandesh the depth of underground water varies from 30 feet to 80 feet, the depth increasing with the quality of the soil.
- (f) The average annual expense for one well with one met is about Rs. 250 and the annual income is about 300 to 350. The number of acres watered by one well with one mot varies from 2 to 4 acres, the area irrigated being the greatest when the quality of the soil is the poorest.
- (g) I have no personal knowledge about artesian wells and their possibility in Gujarát.
- 8. (a) Crops at times suffer from more than necessary rain when the sell is rich. But these occurrences are so scarce that no consideration need be given to them.
- (b) In this district there are very few lands which suffer from water-legging and consequently no expenses are necessary in that direction.
- 9. In Khandesh people were employed in the last famine, on read-metalling and read-making. The earthwork of Shirpur-Chopda Road was completed in the last famine, but no farther steps were taken to metal the road and make it complete. The consequence is that the road is not completed and is damaged by rainfall.
- 10. (a) In Khándesh no programmes have been prepared before the famine set in, and a good deal of time was spent before works were settled upon and opened for work.
- (b) In the last famine two plans have been approved of in case any more funue visits the district.
- 11, 12, 13. I cannot give any definite answers to these questions.
- 14. The pretective value of irrigation works in the last decade is not very great. Irrigated lands are taxed very heavily, irrespective of the consideration that the canal water is insufficient in years of drought. People roared up valuable plants such as limbu, santra, ganvas, otc., under valuable plants such as cimes, santra, garvas, otc., under the expectation that the water-supply would be sufficient to maintain them in all years. That expectation not being realised, people were put to great and parmanent less when the sudden drying up of the caual destroyed their valuable plants.
- 1. Q. (The President, through Mr. Muir-Mackenzic as interpretor.)—What is the minfall in Korvand?—From 15 to 30 inches.
  - 2. Q. Can you read the gauge ?-Yes.
- 3. Q. Were any plans passed for the Shirpur and Kervand projects ?—Plans were propared by Mr. Karpur (the Executive Engineer) about two years ago for Korvand only. But I do not know the particulars.

Mr. R. C. Khare. 18 Dec. 01.

- 4. Q. They are situated in the west ?- Yes.
- 5. Q. Do you think these two works will supply the whole taluka with water?—Yes; Kervand will supply the whole taluka except the hilly tracts.
- 6. Q. No you believe in the irrigation of black cotton soil P-Yes.
- 7. Q. Even it it is deep ? Yes. If in the light cotton soil five neres me irrigated by one mot only half the area would be irrigated by it in deep black cotton soil.
- 8. Q. (Mr. Higham.) You say a well of one mot costs about Rs 250. for its working throughout the year; has that been your own experience !-Yes. Ra
  - 9. Q Can you give us details ?-Yes.
  - 10. Q. What are they?

1 pair of bullocks co	141 Kg. 10	00	Cyvital	Ra.
charge for	depreciat	ion	and	
interest .			•	20
Farm sercants .		•	•	195
Agricultural labour	•	•	•	20 to to
Grass for cattle .	•	•	•	60 m 76
Mote and taising ay	inatatus	•	•	23
		T	ital	253

- 11. Q. (Mr. Ibbetson.) What is your profession?-I am a Pleader.
- 12. Q. How much land do you own?-About 1,200 to 1,400 neres.
  - 13. Q. Do you belong to no agricultural family ?-No.
- 13. Q. (Mr. Rajaratna Mdlr.) Do you lease your land or do you cultivate it yourself !- I cultivate some and let
- 15. Q. What rent do you get from your tenant?—It vailes from year to year; for the 1,000 acres that I have let to tenants, I get about Rs. 1,200 as rent, of which Rs. 200 to lis. 300 are received in cash and the balance in kind.
- 10. Q. If you take it in money how do you fix it approxi-mately?—According to the quality of the soil. If I take half the produce that would sometimes mean considerable gain and sometimes loss, especially for land higher up in the fulls.
- 17. Q. Can you tell us on an average what percentage the land yields on the outlay?—About 74 percentage, but in some cases the land 18 naturally good, and in others we have to spend money on improvements.

WIRNIAS No. 51 .- Mg. NARAYAR VISHNY, Supertisor, Peons Irrigation.

Answers to y rinted questians.

Mr. N. Piehnu. 18 Dec. 01.

#### A .- Graffal.

- 1. The answers below refer to Peops District (Purnadhar Haveli, Bhinthadi and Indapor Teluksy. Having bear solely in charge of largation works (construction and administration) for the last 234 years, I have had opportunities to see personally into all the detailent irrigation management.
- 3, (1) There is no abstacle for extension of irrigation from spatistry of population,
- (2) Insufficient supply of cattle does not form an obstacle to the extension of languation.
- (3) In-uff-irner of manute Is a consilerable obstacle to the extension of irrestion.
- (4) Uneunability of all has not much to do with the extension of progration.
- (8) Uncertainty of the supply of mater or its too late commencement or too early constilled does in some way form an obsiscle to the extension of strigglant.
- (6) Lack of capital for the critial esp-nilitute funds for the norre expensive entitled but irreguled encys very employed by uneithers with the experience of irreguler.
- (7) Fear of cilared tent or revenue accessment dies impole the extension of Irrastion.
- C The extension of irritation has not yet tended to injury remaining controlling by structing his criticators to the tribused tracts.

There is a very atrong desire evine I among the people of this district to have the means of irrigation extended to it or increased.

## B -Canals or Contintors From

- 7. (1) The value of the pridow of land is in-reveal by 25 per cent, by collivation of two harrests instead of one.
- (2) By the substitution of a me for less unimable empt is increase in the rains of the positive is also it digrat court.

  (d) (a) in a year of ample rainful tie taken of the
  reduce of land is not more as by irrigation to any appre-
- produce or ra-ciable extent.
- (b) In a year of a routy rainfall the value of the produce of field increases by irrigation by 100 per cent.
- (e) In a year of dought the value of the produce of land increases by most lon per cent.
- 8 The menass in the total around rater of the produce per note that in the irritation [1] on the average of a normal term of years is Rs 50 and (2) in a year of drought Rs. 77 per nore.
- e. (1) Anoual rate per nore pail on account of irriga-tion by the cultivator to the owner of the (canal who in this district to Government) is the II on area not cally watered.

- (1) Re. 5 per aero of the actual area irrigated or the area of the holding is the average rate of payment by the cultivator to the owner of the land in the form of enhancement of rint. Sometimes this rate ries up to Hi to 15 rupes per acre, deposing up in the conveniences of cultivalion, such as proximity to markets or certires of popula-
- (3) lis. 3 or thereshous are paid by the namer of the land to the florerisment in the form of collamement of recenuser water alreadage rate up the whole irrigable
- 10. Turice arms per acre for the initial cost to bring the water to the field and four arms for periodical reports is accepted and its, to for preparing the land for irrigation. This expenditure is always lorgered by the terror. Prospective increase in the value of event is the only accepted to recomment. are alty for recorposent.
- security for recorposent.

  11. Damage is done to the soil from irrigation without manner, also from no prefer or too frequent watering and also form waterlagging or sait efforcemet. This also affects the insult of the project softing in close provincing to such lands. The form of the decrimation of the soil is the loss of its fertile property. The extent of the degree is not to will increase with the continuous of tripation on let the also remembed circumstance. The copy of the defendance in the defendance of the dispersion of the defendance in the dispersion of the description of the dispersion of naturals or presenting sie deter oration is by the deter praisen is by-
  - (i) Replacing the lost natritive elements.
  - (2) Stopping prefuse and frequent valerings.
  - (3) Clange of crops.
  - (1) Introduction of improved drainage nords.
- The impation is of 16 years' standing, and the coil sprang from it 12 to 13 years and include stationary. On people on leads proceed with drawing are much better than crops on lands with ut dealence.

# C .- CANALS OF ISTPENITIEST PLOY.

12. (1) The manner in which the his Nellacand and other groups of earths at Jeur, Walsh, Include and Manla Nalishaju the Para dher Taluka of the Poors Dietrict are supplied with water in en mu fer :

A small temporary is not is thrown every year at the class of the mere come or at such times which necessitate irrigation. The position of the band is generally at the head of a drop in the nallah hed so that a classical cut from the side of the band can take water to the land along the banks of the railah or to fields which can be commanded by the

(2) The distribution of water to the lands commanded by the above-mentional channels is up to according to the areas to be watered during a facility of rotation, which is generally taken to be a fortnight.

Mr. N. Viehnu.

18 Dec. 01.

- (3) The period for which the supply is ordinarily
- (a) a year of ample rainfull is between October and June;
- (b) a year of sounty rainfull between October and February;
- (c) a year of drought these causle do not act at all.
- 13. The extent to which the value of the produce of land is increased by irrigation is similar to that of lands under causls of continuous flow in years of ample rainfall.
- 16. Irrigation under intermittent canals is generally supplemented by wells where it is possible, and this is essential in years of scanty rainfall.
- 17. The annual average rate per aere paid on account of irrigation-
- (3) by the ewner of the land to the Government in the form of enhancement of revenue or water advantage rate is about Rs. 3 per acre of irrigable area.
- 18. Private expenditure necessity to bring the water to the field or to prepare the land for irrigation is the same as for lands under canals of continuous flow. The expenditure is incurred by the tomant and he has no accurity for the propagation of the propagation in the relation of the propagation in the relation of the propagation in the relation of the propagation is the relation of the propagation of the propagation in the relation of the propagation in the relation of the propagation is the relation of the propagation in the relation of the propagation in the relation of the propagation in the relation of the propagation in the relation of the propagation in the relation of the propagation in the relation of the propagation is the relation of the propagation in the relation of the propagation is the relation of the propagation in the relation of the propagation is the relation of the propagation in the relation of the relation of the propagation is the relation of the r
- recomponent except prospective increase in the value of crops.

  19. Deterioration to the seil has resulted from irrigation without manure. The profuse, too extensive or too frequent irrigation, water-logging and salt cilloreseence are a recely met with on these canals.
- 20. The maintonance, repairs, silt elearance and the like are all carried out by the irrigators at almost no cost, as bodily labour is contributed by each irrigator. The system works well and no legislation is required.
- 21. All such canals are constructed by private persons. No trouble has over arisen in regard of the supply of water and of the realization of dues for the same. Government has not found it necessary to take over the management of private canals.
- 22. It is advisable to encourage and assist the construction by private persons of farther tannla. This can best be done by inducements of low water-rute for a period of years after the construction of such causls. Advances may also be given for initial expenditure.

### D.-TANES.

- 23. The tanks in the Pouns District are supplied with water by (1) flood waters of the nallahs an which they are built. There are some tanks which are fed from the canals of continuous flow in addition to the floods.
- (2) The distribution of water to the lands is made in the same way as for lands under causis of continuous firm.
  - (3) The supply is ordinarily malutained-
    - (a) In a year of ample minfall for a whole year.
    - (b) In a year of seanty rainfall up to oud of January 14 possible.
    - (c) In a year of drought the supply is altagether doubtful.
- (t) The area ordinarily irrigated from a tank varies with the capacity of such tanks.
- 21 The answer to this paragraph is the same as noted under paragraph 7 above.
- 26. The answer to this paragraph is the same as for paragraph 16 above.
- 27. For answer to this paragraph please see puragraph 8 above.

# Poons District. (Deerna.)

# Question No. 2 .- (Culturable and irrigable areas, etc.)

Answer.—Ordinarily there is no demand for vater for trigation during south-west monocons except percunial crops. The following statement shows the crops under irrigation and other particulars:—

Crops.	Numb of watering		Time.	Renaurs.
Perennist .	27 to :	30	13 months	Pan gardens (Letel-leaf) Popula water sacry lih
Eight months † .	13 to 1	15	Jane to January	day. 1 His number of referings yaries seconding to
Monsoon wit t . Rabl 7	1 - 4	2 4 U	June to Delober Dilta. November to L'chrunry.	the quantity at dimier- val of rainfall,
Hot wrather stodder crops)	O fo	8	Match to Jone .	

28. The masser given to puragraph 0 above applies to this paragraph.

22. Vide answer to paragraph 10 above.

SO. The maintenance (watching, repairs, silt clearance and the like) is provided for by Government at an annual approximate cost of Rs 1½ per acre irrigated. The system works fairly well and no legislation is required.

31. There are no tanks in this district constructed by private persons.

92. It is advisable to encourage and assist private persons in the construction of further tanks by employing famine labour on them and by granting special concessions to owners of such tanks.

88. There is not much inconvenience experienced from the liability of tanks to silt up, as the silting always takes place in the deepest parts. No statistics regarding the silt accumulation are unvalable. The silt is not removed by dredging. Stops are taken to prevent ultimate silting up of the tanks by leaving sluices in the lowest parts of the tanks.

### E .- WELLS.

- 31. (1) The arrange depth of permanent wells is about 40 teet, the water surface bring about 30 feet deep and depth of water at the beginning of hot weather 10 feet.
- (2) All wells are invariably supplied from springs; in case of wells close to and under canals, the supply is from canal perculation also. These springs are liable to fail in a year of drought: they do not, however, fail in an ordinary year. There are no saline wells in this district.
- (3) The average cost of construction of a permanent well of two mots capacity (that is, a well which can supply water for two mots all the year round) is Rs. 1,500 to 1,000. The average cost of kachcha wells is Rs. 250 to 300, the cost always varying with the diameter of the pit and the material used in construction.
  - (4) The average duration of a well is 75 years.
- (5) The water is usually raised by mote drawn by two or four bull-cks according to the size of the mote and the depth from which water has to be lifted.
- (6) The average area attached to and commanded by a well of one mot is four acres and that of two mots from eight to ten acres.
- (71 The average area irrigated is two acres in any one year.
- 3S. Serious difficulties are met with in the selection of a spot in which a suppty of water will be obtained. No difficulties are met with in netual construction. No assistance has been offered by Government or by local bodies in the shape of expert advice, trial borings or otherwise. It would be useful if it were given, and this can be done by appointing an engineer who can give expert advice by taking lovels and borings.
- 30. The construction by Government of wells in and which is private property is fersible if the wells were constructed on junctions of three or more survey numbers, so that one well could be useful for all. Such an arrangement will reduce the cost of a well to a minimum and the rental charges payable to Government ought to be consequently very slight.
- 40. Temporary wells (bhudkis) are commonly used in this ill-strict where possible. They are, however, no protection against draught as they full with the nallahs. In a year of seasty ramfall temporary bhudkis should be encouraged by supplying to the cultivators the necessary appliances at nominal rentals.

31

The distribution of water if under Government supervision is controlled by the rotation system, by special establishment appointed for the purpose; and irrigation revenue is remized as a separate water-rate in case of tank irrigation which is under Government control and for which capital and revenue accounts are kept; but the irrigation rate is shuply an enhanced cess on the lambs irrigated from ald irrigation works for which only revenue accounts are kept.

Question Nn. 3 .- (plack cotton soil.)

Answer.—When the land irrigated is black soit there is no durand for water in areingo minfall sensons, but it is required when there is prolonged drought. In years of good rainfall there is a folling oit in irrigated areas and the revenue is more piecarious than on tanks where the lands are other than black soil. There has been a great desire on the part of owners of black soil lands to have irrigation tanks, because this district has not good and seasonable rain daring one out of five years. There are not continued stretches of black soil and generally no average cultivator possesses all kinds of hands and any one of which requires water for crops grown on it in all seasons of the year. Directly, tanks as not reconnegative, but they are desirable in so far as they conduce to the general welfare of the surrounding district.

Mr. N. Vishnu.

Question No 4 .- (Government irrigation works.) Answer .- The Nira Canal and the Mutha Canal can 18 Dec. 01. sofely he depended upon in a season of drought.

Question No. 6 .- (District or village works.)

Answer .- The protective value of these works can he increased by expending more money on them and by greater attention to their up-keep and by constructing naw works. Local responsibilities abould be enforced. The value of such works (without reference to irrigation) concerning the water-supply of villages for men and oattle is very great. . Question No. 7 .- (Wells.)

Answer.—It is both desirable and possible to stimulate construction of new wells by inducement and advances to land-owners.

Out of 155 wells inspected and for which information has been gathered, 114 have failed to supply even an ordinary supply for drinking purposes. Nine wells were despended with the nesult that all of them supplied an increased quantity of water, but not quito sufficient for the asual area under those wells during previous years of good rainfall. Three wells failed ultogether. Average depth of water helow surface 30 feet; and orea irrigated nuder each uverigad two acres. Average cost of each well used for irrigation is Ss. 250.

# Question No. 8 .- (Drainago works.)

Answer.—Tracts of land under the Nira Canal in the villages of Moorum, Karinja, Wadgaon, Paudhera, Sangwi and under the Mutha Canal in the villages of Manjri, Hodapsar and Moondva have been water-logged by excess of percolation from the canals and the had nature of the soil; but this area is only about one per cent. of the whole water-logged had the soil that the area water-logged and the soil and the soil of the whole water-logged had been soil to be soil t irrigable area. There are no dreinage works and none are

Question No. 13 .- (Irrigation receipts and charges.)

Answer.-Water-ruten are fixed from time to time on each tank separately for the various crops grown. Appli-

cations for water are received annually (every season) for crops raquiring it. The distribution of weter to applicants is controlled by—

- (1) demand and supply available in the tank;
- (2) priority of application for water;
- (3) situation of the lands to be watered; and
- (4) nature oud value of the crops requiring water.

The effect on irrigation and irrigation revenue is very marked in years of good rainfoll. In years of favourable rainfall, the monsoon and rabi irrigation areas fall off by almost 76 per cent. There is not, however, much falling off af reveoue, as perennial crops come to prominence is such years. Arrangements are always made to keep the tanks empty at the beginning of the monsoons of each year. The supply in the tanks cannot be made to leet longer than one year all the calculations for the tanks are based upon 12 months' samply only. the construction of the tanks to hold moathe sapply only, the construction of the tasks to hold water over 12 moaths' supply being a more waste as replenishment is a certainty from the regular ghat rains.

Question No. 11.—(Vulne of works in reducing cloims for famine reliof.)

Answer.—The protective value of irrigation works can not be in this district oversated.

Areas irrigated under these tanks in 1807 were as fol-

Acres. . 12,691

Mutba Caual ٠ Nira Canal . . 47,514

No villages protected by these works required any famine relief in 1897 and in subsequent years. Had these works been non-existing the cost of famine relief would have increased in this district by at least 10 lakhs of rupees in any one year of famine.

- 1. Q. (The President)-You belong to the Public Works Department f-Yes.
- 2. Q. What appointment do you hold?—I am a sopervisor.
- 3. Q. How long have you been in the department?

  Twenty-three and a half years or a little over that.
- 4. Q. You have always been in the Poona district ?-
- 5. Q. How long have you been in the Irrigation Divi-sion?—From the beginning of my service.
- 6. Q. You know the Nira Cooal and Mutha Caual?— Yes, I know hoth. I have worked on the former system as well as the latter for years.
- 7. Q. You say, "The Nira Conal irrigates 45,000 acres?"

  -Yes, that was the area last yeer.
- Q. What is the maximum discharge of your cunal ?-450 cusecs; there is a proposal to calarge it to 720 ouscos.
- 9. Q. Where does the water come from ?-From a
- 10. Q. Is it proposed to enlarge the storago also?—Yes; two new sites were selected; what hecams of the proposal I do not know.
  - 11. Q. In the water freely taken on the Nira ?-Yes.
- 12. Q. Always ?-Yes, but most freely during the wheel season.
- 13. Q. Do the people apply for water every year?—Yes; every season for rabi, kharif, and the hot weather crop. The hot weather crop is between 31st March and 15th June.
- 14. Q. Do you give water then for fodder crops?—Yes. When we have easiscient water we give it; otherwise we
- 15. Q Do you give water to sugarcane P—Yes, and to comogardon crops which are carried over from the fabi season. For hot weather crops we charge separately. Sometimes the onlivators take the woler without leeve; we then charge a higher rate.
- 16. Q. Do you think it would be wasted if they did not apply it ?—The difficulty would be to manage an equal distribution. There is a rush for water sometimes and the people don't obey orders. Even now with the applications, it is difficult to the state of the stat it is difficult to regulate the distribution.
- N. Q. How is the water given out of the sand; they you small sloice?—We have outlets. We estimate that a particular outlet can irrigate so many acres und if we find the applications on an outlet more thou we can irrigate

- we redoce the area for each cultivetor proportionately. The Mira Canol is a protective work and we have made arrangements to give water to the cultivators proportionately to their holdings.

  18. Q. Whom do the outlets belong to ?—All the outlets belong to Government.
- 19. Q. How are the sites fixed ?—According to the land to be irrigated. The whole land between two nollahs can generally he irrigated by an outlet.
- generally he irrigated by an outlet.

  20. Q. If you abolished the application system, what would be the result?—The result would be that persons at the head of the outlet will be able to irrigate their lands and persons at the tail will get no water at all. We so orrange that everyone gets water every five days or eight dars. days.
- 21. Q. You ebut the oatlets for a certain number of days and keep them open on certain days?-Yes.
- 22. Q. Does the cultivator of the head take advantoge of the open outlets ?—No. From these outlets we have smaller outlets for which locking arrangements are made. The outlets are generally kept open for three days. The Pathkari begins ut the tail and weters each field in rotation. tion.
- 23. Q. What is the volume of water delivered?—Our distributaries carry about 60 ensecs; the coulcts to the fields deliver chout 1 cusees.
- 24. Q. Water is given to every opplicant in rotation?— Yes, by Patkarrs and Chowkidars; we pay Rs. 7 to the mon who opens the outlets and Rs. 11 or Rs. 12 to the mon who measures the areas and sees that cause rules are
- 25. Q. Is it not difficult to find houest men for this work?—Bribery is always going on. When tangible proofs of dishoaesty are produced, we dismiss the men. There is no other way. From experience I believe that the cultivators are more at fault than the canal establishment. Even if the distribution were left to the villagers than would be porticilities. there would be portialities.
- 26. Q. Is there my leakage in the canal ?—The canal is not water-tight, but we have made many improvements. We lose halt the water by leakage in 100 miles.
  - 27. Q. Does the cauni run all the year round ?-Yes.
- 28. Q. Is the water in the canal muddy ?-No.
- 29. Q. Is there always a demand? There is never any doubt-shows, the people taking the water?—No.; there is always a demand.
- 30. Q. Have you say black cotton soil under the canal f

- 31. Q. Have you any experience of black cetton soil ?-
- 32. Q. Yon say "there is a great desire on the part of awners of black-soil lands to have irrigotien tanks, because this district has not good and seesonable rain during one out of five years." De you think that where the rolus are so uncertain as in Poona, the people will take water to irrigate black cotton seil P—I am not certain, but I should say they would take water in four out of five years. The seil is not the real black cotton soil. Dering the last three years the drmand has been very great.
- 33. Q. You spoke about the project for enlarging the canal P-Yes. Our water is not sufficient for all the requirements of irrigation.
- 34. Q. Do you not irrigate the whole of the irrigable land every year ?-No, if the canal is enlorged it will irrigate a much larger area.
- 35. Q. You propose to irrigate a larger area without any increase in the length of the canel !-Yes.
- 20. Q. Is your canal connected with any village tank?
  -- No, the Mutha Canal is connected with two tanks.
- 37. Q. Are these tanks fed by the canal f-Yes, they ore fed by the canal and by nallah water.
- 39. Q. The object is to store the water that goes down?

  —Yes. One tank is being made on the Nira Conal.
- 39. Q. Te there room for mere?—There is room at the tail of the Nira Canal for three mere tanks. A good deal of water goes to waste.
- 40. Q. Supposing it was desired not to allow any noter to go to waste could you make a reservoir to hold all the moreon supply?—I do not think so; the cost will be prohibition
- 41. Q. But the result would be a great increase of irrigation !- Yes.
- 42. Q. The Nira is worked with the object of being a protection against familue?—Yes.
- 43. Q. It is the largest canal in the Presidency f-Yes, excepting Sindh.
- 44. Q. It irrigates 47,000 acres?-In some years it irrigates about 60,000 acres.
- 45. Q. What is the culturable area commanded ?-
  - 46. Q. It irrigates about &?-Yes.
- 47. Q. To irrigate a larger area you would want to lengthen your channels:—No. They would require widening.
- 48. Q (Mr. Higham)—Is the land left follow at times?
  —No, the practice in these parts is to go on manuring and growing crops every year.
- 49. Q. (The President)—Supposing the irrigated area is increased, could the people get sufficient manura for it?—That would be a difficulty; but there is an inexhaustible supply of fish manure which is now coming into vogue.
- 50. Q. Would they use it for wheat and juari ?—At resent they use it only for sugarcane, but in time they will use it for everything.
- 51. Q. You say, "in a year of anuple rainfall the value of the produce of land is not increased by irrigation to any appreciable extent." Doyon find prople taking to irrigation in such years?—Na, not when there is a good rainfall and when they are sure that the rain will be quite sufficient.
- 52. Q. Supposing they get a good minfall up to the 15th October and then there is no more, what do they do?—Then they rush for water.
- 53. Q. You don't generally have rain in the cold weather?—Sometimes. I know of a good rainfall throughout the whole rabi season in December and January.
- 51. Q. That is very exceptional?—It happens once in four years or five years.
- 65. Q. Then the people do not take canal water?-No.
- 56. Q. What do ther pay for irrigating rabi?—As. 2 per acre on the Mutha Canal.
- 57. Q. Wenld they take more if they had to may less?— Na, they would not. They don't mind paying the full rate for only one watering when they want water.
- 58. Q. Would they pay o rapes more ?- I think they would.
- 50. Q. For rabi?—Yes, they take water without permission so as to get it quickly and pay double rates wilhardy.

- 60. Q. Would that be in a year of drought?—No, any year. They take water without permission and we fine them charging double rates.
- 01. Q. Does the distribution require a very considerable establishment?—No. A Patkari looks ofter about 200 acres.
- 62. Q.—You have 250 Patkaris?—Ne, we do not increase the establishment when the area extends. We keep a permanent establishment according to the area under percential crops. During the rabi season—four menths—we generally put on Assistant Patkaris to guard the outlots.
- C3. Q. Are not these men open to bribery?—At times there is a great rush for woter and it may hoppen that they are bribed then.
- 64. Q. Do yen think you could abolish the application system altogether ?—No; it would not do. If we give up the system there would be great complications and difficulty in assessing the rates.
- 65. Q. Why, you can measure the areas irrigated P—
  It eaunot be done. Daring the kharif season they plough
  directly the crops are out and unless we have opplications
  our establishment cannot find out what particular holdings
  have been watered.
- CC. Q. If a man does not upply and takes water he is detected now t—Yes, he is detected because it is not a matter of a week or four days; it is a motter of four months.
- 67. Q. Do you prepare ony list of persons who apply?

  Our establishments have to make a list of all persons who are permitted to take water.
- GS. Q. You say u man who lakes woter without application can be detected during there four months?—Yes.
- 69. Q. Many are detected ?—Yes. The difficulty will be for our establishment to go to onch field. Then the man who takes water this year may not take it next year; so overy time we would have to make fresh lists of persons taking water.
- 70. Q. How do you assess the lands?—Applications are received through the village anthorities; we make sure that the man is the home file owner of the land; then our Inspector goes to see that the land is properly prepared for Irrigation. A pass is then granted, a copy of which is registered in the Sub-Divislonel office. The Patkari on his round of inspectom examines these passes. Atterous or two voterings are done measurements are taken. The measuring officer takes with him the register of the passes and has a map with him from which he finds out the number; if he finds that there is any helding which is not registered, he measures it and reports that such and such a holding has been wetered but not detected by the Inspector or the Patkari. An explanation is asked for and if it is not satisfactory the Inspector or the Patkari is fined or dismissed.
- 71. Q. You say "orrangements are always made to keep the tanks empty at the beginning of the measons of each year." What do you mean by that ?—In the case of the Bhatgarh reservoir we open out our gates at the beginning of the meason and lot oll the water out. We get a telegram from Bombay that the meason has burst before we open the gates.
- 72. Q. What is the advantage?—We do that so as to prevent a deposit of silt brought down by the first floed.
- 78 Q You never try to keep your water for two seasons?—These reservoirs ore not made to last for two seasons. In the case of the Mutha Canal, it is very difficult to keep the water for even one season.
- 74 Q (Mr.Migham)—When people on the watercourse send in applications for the area they want to irrigate, I understand that you are bound to give a certain quantity of water from each outlet on the days the outlet is open?—Yes.
  - 75. Q The canal is divided into sections ?-Yes.
- 76. Q. The water is ued to each section depends upon the area for which the pass is given?—Yes.
- 77. Q. When water goes through the outlet does the establishment have anything to do with regulating the distribution within the watercaurse P-Yes. They begin to open the field outlets at the end of the distributaries.
- 78. Q. They begin at the end?—Yes. The end people get the first day's water, and an the last day the people at the head get water and then the outlet is closed.
- 79. Q. Have you seen the circulars which were lately brought into operation?—Yes. All these orders have been carried out.

Mr. N. Veshnu.

18 Dec. 01.

Mr. N. 80. Q. J Fishnu. late institu quontity of 18 Dec. 01. of its torn.

- 80. Q. Yon have a Check Inspector?—Yes, that is a late institution. A Check Inspector sees that a proper quontity of water is given; and that no outlet is open out of its torm.
- 81. Q. He has oothing to do with the distribution or control of the field outlets?—Nothing.
- 82. Q. Hie cootrol is limited to the canal openiogs?-
- Yes.

  83. Q. Your Patharis alone control the distribution inside the watercoarso?—Yes.
- S4. Q. The Inspector does not control that?—No. Ao Inspector bas general control over two or three Patkaris. He has only to see whether the area which has to be watered is watered or not doring a particular period, and if anyhody has remained without water for some reason or other theo to allow him certain days and make up hisquantity.
- S5. Q. What is the length of your watercourse?—The smallest is only 50 to 90 feet. They run up to about a mile in length.
- SG. Q. How long are the distributaries?—Some are 18 miles loog; but there are small distributaries where pipes are 4 to 6 icohes and the discharge is 3 cubic feet per second. All the distributaries are built by Government.
- S7. Q. At the end of the Government distributaries, you have o distributing basin?—Yes, on both eides. We find it very difficult sometimes to carry water by the distributary, wheo therois deficient water in the canal. We have theo to make fresh arrangements to give woter of the head on particular days and to give water at the end out of rotation.
- 88. Q. What is the plan of the watercourse?—For every noe hundred seres, we allow a 12-inch square outlot.
- 89. Q. It makes no difference whether they want it for rice or bajri?—It does. This will suffice for 100 neres of juari; we take juari as oor basis.
- 90. Q. Do you put a lock to the field cotlet?—Yes, otherwise the cultivators open it.
  - 91. Q. Who locks the outlet?-The Patkari.
- 92. Q. Do the coltivators ever break them?—Yer, sometimes. We then five all the cultivators on that outlet if they do not find out the man who has opened it. If we have reason to believe that all the cultivators have combined and opened the lock for the purpose of irrigation we fine all.
- 93. Q. You get them fined by the Magistrate?—No, we only tell them that so much damege is done and that they have to pay so much.
  - 94. Q. And do you recover in that way ?-Yes.
- 95. Q. Do you ever prosecute them for damage?—Tes, when a man is cought to the out; but the difficulties of prosecuting are very great.
- 96. Q. Whom do you proseento them before ?—Before the Mamlatdar; bot it is very troublesome. Our establishment has to go before the Mamlatdor to proseente and then there is nobody to look after our distributaries. We avoid proseentions as much as possible and punish them departmentally.
- 97. Q. You have ootlets 12-inch square for every 100 neres?-Yes.
- 98. Q. That is a greet number. What is the irrigable ares on a watercourse?—It goes up about 5,000 to 0,000 oeres on the biggest watercourse of which the command is 30,000.
- 99. Q. When do you measure the crop?—Kharif crops are measured after the first woterings are over, i.e., from the middle of August to October or November.
  - 100. Q. Doriog the currency of the crop ?-Yes.
- 101. Q. Do you have fical measurements?—No. Ten per cent. of the crops are measured by the Sub-Divisional officer or any of his sub-officers.
- 102. Q. Suppore any area measured after the first waterings fails to mature how is that remitted ?—The cultivator has to apply; we do not give any remission without application.
- 103. Q. What is your final area compared with your register?—We find that the orea measured is always about 25 per cent. more than what was applied for.
- 104. Q. Do you take any notice of that?—Yes; we assess the netual area measured and oot the area applied for.

- 105. Q. Who measures ! We have got regular measuring karkens.
- 106. Q. Are they under the Collector?-No, they are under the Irrigation Department.
- 107. Q. Bot the Irrigation Department people have to obey the Orders of the Collector?—Yes. But the Collector has nothing to do with the assessment.
- 10S. Q. Is there any appeal from the orders of the Collector on caonl questions?—Yes.
  - 109. Q. Allowed by roles ?-Yes, by the Canal Act.
  - 110. Q. Do they make many appeals ?- Very few.
- 111. Q. You say that during the famine of 1897 no relief was given to any of the villogers who irrigated from the Nira and the Mutho Canals?—Yes.
- 112. Q. Did any people from the Mutha Canal villages go on relief works?—As far se my ioquiries go nobody went; they bad sofficient work io their own villages.
  - 113. Q. They had good crops?-Yee.
- 114. Q. Did they employ labour from other villages?-In very small proportions.
- 115. Q. Yoo say 10 lakhs were spect on famice reliefs is that a rough estimate?—Yes.
- 116. Q. Iu 1876-77 Government spent on the Nira villages 11 lakhs of rupees?—Yes. I was there; I know the figure.
- 117. Q. In last famioe Government had to spend nothing?—Nothing. In 1876 the Mutha Caual was finished up to the 25th mile and beyond that they had famioe labour.
- 118. Q. Do yoo recommend the construction of tail reservoirs?—Yes.
- 119. Q. Do you recommend them for the irrigation of black-soil or any soil?—Anywhere; the block-soil here is not the black cotton soil of the Berars; it is a black oil which requires water.
- 120. Q. It only requires water in the case of dronght?—. Yes; in other seasons the soil grows good crops without watering.
- 121. Q. Do they grow wheat without water !-Yes, in seasons of very good raio.
- 122. Q. If they use water in a year of good rain does it do any harm?—They don't care if they get a 12-anna crop; some crops get damoged by the canal water.
- 123. Q. Wheat orop get damaged by excessive watering ?
  -Yes.
- 121. Q It blights and rusts ?-Not by canal but by rain water.
- 125. Q. (The President)—In paragraph 11 of page 2 you say, "damage is done to the soil from irrigation without manare and also from water-logging or salt efflorescence." Is there any salt efflorescence on the Nira Canal?—Between 13th and 25th mile there are one or two square miles on the right bank of the canal where there is efflorescence.
- 126. Q. Has anything been done to remedy it P—Nothing.
- 127. Q. You have got no experience of drainage ?—No, ~ that was suggested at ooc time by the Inspector General for Irrigation, Mr. Forbes.
- 128. Q. Woold you recommend drainage?-No, I don't thick drainage can do acything for salt efficrescence.
  - 129. Q. Is it getting worse?-I hove no experience.
- 130. Q. You don't think it is likely that if land is well drained it would waso away the salt?—I have no experisone.
- 131. Q. Have you ever known o year in which all the water was oot ased on these causls?—On the Mira Caoal, yes.
- 132. Q. When was the last time?—I remember two years when we had to let out 50 feet of water.
- 133. Q. 1895 was one year; what was the other f-1890 or 1891.
- 134. Q. How long has the canal been working?—Since 1884. Every year we lose a little water, but these years nere abnormal; we had to send down water.
- 135. Q. Because the raio was excessive?—Yes, and there was no demond for rabi water.
  - 136. Q. You say every year you lose a little?-Yes.
  - 187. Q. Nothing very coosiderable?-Ro, very little.
- 138. Q. (Mr. Ibbeison) You say the canal has been working from 1884? Yes.

, · · · · , ,

- 130. Q. In 16 years you have had two years in which you did not make use of all the water ?—Yes, before that the canal was not in working order; every year swater is let down for the facility of raising the dam.
- 140. Q. (Mr. Nuir-Mackrazic)—How is it that the irrigated area is much larger in famine years than in the years of ordinary rainfall?—Because the people don't take water in the rabi season.
- 141. Q. If people don't take water how is it that you have not an excess ?—We increase the area of sugarcanc.
- 142. Q. (Mr. Ribetson.)—If yoo have a short supply of water you give less to sugarcane?—No; if water is short we out off the area at the tail.
- 143. Q. Supposing another man wants water beyond?—We dan't give it. We say, "grow your sugmeans under
- 144. Q. You do out dawn the applications?—I'es, that is only on the Min, which is a protective work. On the Mutha, which is a productive work, all the demands are met.
- 1.15. Q. Do you give water first for irrigating sugarcane on the Mutha?-Yes.
- 146 Q. You look upon that as a commercial concern?—Yes.
- 147. Q. Why do von make that difference between the two canals?—The Nira Canal is a protective work.
- 149. Q. And the Mutha Canal?—It is a productive work.
- 149. Q. You don't know the origin of the difference?-
- 150. Q. What kind of villaga works have you. Have you bandhards?—No, we have small tanks.
- 151. Q. Have you any experience of tanks?-Yes, of two
- 152. Q. Am there not many dauks in Poona?-There are four tanks in working order.
- 153. Q Not several hondrods?—Not more than half a dozen or at the most nine.
- 154. Q. You say, "local responsibilities shoold be enforced." What do you rocan by that?—People should be made to clear the silt.
- 155. Q. I thought Government was responsible for clearing the silt?—No, in sonall tanks it does not pay; Government would be paying more than the return.
- 156. Q. Where it is not worth Government's while to clear, what do you do. Do you make people do it?—Yes, and if they don't do it, we give them a tortuight's notice that the water will be slopped.
  - 157. Q. Do you stop the water?-Yes.
  - 158. Q. And they are afraid of that F-Yes.
- 159. Q. In the case of village tanks supposing these people don't clear them, how do you manage?—When there is mater in the tank, they clear it voluntarily.
- 160. Q. Da you think legislation would be useful to enforce them to do it P-Yes.
- 161. Q. If tanks are so useful and valentle, why have you not got a number of them, as in Gujarat?—The want of funds is the principal obstacle.
- 162. Q. The people are paorer here?—I have not seen the Gujanat tanks; here a small tank would not cost less than its. 20,000.
- 163. Q What do you mean by soull tanks. How many acres would they irrigate?—About 100 acres would be the
  - 161. Q. Jis. 260 per sere ?-Yes.
  - 165. Q. That would be pretty castly?-Yes.
- 166. Q. It would not pry Government to make them ?-
- 167. Q. Yon say, "out of 166 wolls inspected and for which information has been guthered, 114 have failed to supply even an ordinary supply for drinking purposes?"—All these are above the canal.
- 103. Q. They began to full in the first famine year f-They did not full in the first year; in the second year there was good rain; last year they fulled.
- 169. Q. This year have they failed ?—No, not yet; there was better rain; there was no water in the nullnis last year.
- 170. Q. How about 1890-97?-I was not on the Nfra then.

- . 171. Q. Will you tell me what wells you refer to?—The wells higher up than the caual; all the wells below the caual did very well.
- 172. Q. Do you thick the wells above the canal were a fair type of wells throughout this district?—Yes, in the constorn part. I have seen peculiar things in connection with these wells; I have seen people digging a chain of five or six wells ranging from high ground into ravines. On the top they got good water but oot below.
- 173. Q. You say five or six wells in what area?—In not more than by acres. I know another case in which five wells were sunk in 30 acres and praved too much.
- 174. Q. (Mr. Higham)—The falling of the wells occurs at the same time as the general falling of the spring level throughout the whole equatry owing to drought ?—No; it was irrespective of that.
- 175. Q. (Mr. Ibbetson —You say in your second memo., paragraph 10, that "Rs. 16 per nore are required for preparing the land for irrigation"?—That is sugaroane irrigation.
- 176. Q. You say, "it is advisable to encourage and assist the construction by private persons of further canals." What further canals do you refer to ?—Small canals from streams.
- 177. Q. What would you do to get people to do this How could you help them?—The best way to help them would be to get bandharas built by Goreroment.
  - 178. Q. Would that pay Government ?- I think so,
- 179. Q. You say you would charge no water-rate?—Yes; to induce them to take it up.
- 180. Q. Do you think they will do it on these terms?-
- 181. Q. Supposing you say yoo may have the water for nothing ?—They will do it then. In 1896-97 on the Mutha they turned every deep by means of bunds.
  - 182. Q. That was a famine year !- Yes.
- 183. Q. If the people had three or four good years do you think they would make bunds?—Yes, becomes they would get water for high class crops, which would be more paying than the high rate crops on the caust.
- 184. Q. The canal charges two rupees an acre?—Yes, for rabi crops; the charge for sugarcane is the same on both works.
- 185. Q If a man makes a hund?—No; on the channels all the water is picked up and charged full water-rates.
- 186. Q. You say that the construction by Government of wells in land which is private property is feasible if the wells are constructed on junctions of three or more surroy numbers." Do you think the people would care to have Government going into their lands and making wells?—Yer.
- 187. Q. They would have to pay wet revenue?—They would not grudge paying wet revenue; the difficulty will be of a regular supply; if the water is not sufficient, Government will be the losers in many cases.
- 188. Q. Do you think that the holdings are so small that the people cannot allord to make wells ?—No; there are many cultivator, who have got big holdings; but they one think whicher they can get water or not. If expert opicion could be obtained as to sites they would spend their own money on making wells.
- 189. Q. 1)0 you think boring tools would be useful?—Yes, in these parts, but not on the rocky portions.
- 190. Q. Why not?—Because they are not fit for boring rocks.
- 191. Q.—(Mr. Rajratna Mdlr.). You say if a rayat irrigates his laud without obtaining formal sanction he is hable to a double charge?—Yos.
- 192. Q. Even though his application is not dealt with for a month or two f-It does not take so long to deal with his application.
- 193. Q. It may be at least two or three weeks ?—Inspectors have orders to send in their reports, within three days after the receipt of the applications. Generally the cultivators' applications are not currectly written. There is some flaw in them. As soon as no application is received we have to see whether the bund is properly made and the channel is cleaned of silt and weeds. Ten or cloven days is the maximum delay.

Mr. N.

18 Dec 01.

Mr. N. Fishny. 18 Dec. 01.

. ;

ر چ اور احر

- 191. Q. Does the raynt as a rule change his crops from car to year?-No. Only sugarcane plots are changed every three years.
  - 105. Q. For others crops ?-No; it is too expensive.
- 196. Q. Could not some plan be adopted for dispensing with applications in regard to other crops !-- It is difficult to find probable plots.
  - 197. Q. You have a system of penalty?-Yes.
- 198. Q. You give them water out of turn in some cases P-Yes; the Sub-Divisional Officer does it.
- 109. Q. Has sanction to be obtained in such cases soon as watering on a particular channel is dono the Putkari reports that so many numbers are left without water; and the Sub-Divisional Officer issues orders that water must be given on Sunday, which is set aside for that purpose.
- 200. Q. Do you think the people would be able to regulate their supplies by turns if you allowed a certain quantity of water to each distributary and left it to the rayate to distribute according to their turns ?—I think it could
- 201. Q. There would be no difficulty you think?—No: but it would take a long time to work successfully as the collinators would at first fight among themselves and these at the heal would be more benefited than these at the rnd
- 202. Q. But you would not supply them before their turn? You would not open the claims? i—Once the claims are opened the distributory is at their disposal and the meant the head could use up more unter than these lower dawn. Even now somebow or other a man at the head gots most major.
- 200. Q. Are there many presentions on the Nica Causi ?-Not very many.
- 204 Q. How many per numer i "Not mere than five; we don't go in for proceedings to it establishments, are per to much instrucenteres, and them is cowly to look after ther roth
- 205 Q. Dayer fix the area to be arrivated f.—Yes, in a veir of mounts. In other years the man who applies first gate water frot
- . Let Q Each though he may be a ten applicant P—Year ten applicant and P applicant.
- 207. Q. The per their neadly de !- Ver, exten mater "Il le giren to juari etch.
- 200 Q leaver a count du fix les the mander et f. de 12 green et complement example.
- 200. Q. West in the rate for the Re 2 present. It also done to greatly of dates not the errors in which is to const.
- 210 G the man take one not be of untermodel—Yes, entrageneral requires four unterpose, we to be unsafer until process unsecure and we chouse the will be the to use of metan me have please of view to discuss the fewly.

  211. G the mean united has a thing to do with the safer—No.
- 1812 Q. You margo Re South them you give enterfaceling the entermal.—They always require his water-increased on and a three-leving traped to first Hunch to 18th Jane
- 218 Q In property had of a common order and an interior server in the hillship in experimental and specific persons to consider the construction of traffic the locally granting special commonders to expert of a relative the property of the property of the construction of the property of the property of the property of the construction of the property of the property of the property of the property of the property of the property of the property of the property of the property.
- 216 (2. 16 will en to a low rate of interest?—less that we did the contact of diseases there.
- 215 Q Do sea the may would rose formed on those parts of the many had not been as I for the people will not a former.
- 216 Q Afr. More Unelevel)—Have you racked whether in you district the number of a sile consider the counter to the log to be reard during the faction i—Ver.
- 217 Q thate the to the proceedly then shows ful in anding we can be to which which will be seen to be an top-debut not sufficient to consider grow in the years of drought.
- 218. Q. Bat several to grew then be cellium your?-

- 219. Q. Do you think that wells would be useful ?-Yes, in ordinary years; in years of drought they would not be of any use.
- 220. Q. Do you think that the wells made in these famine years will always be of use to the people?—Yes.
- 221. Q. You don't think people are too lazy to work them?—No; they are keen about irrigation, but the diffi-culty is that often they do not tap water.
- 223. Q. Were the greater number of these wells dug from takari or from private resources?—I could not say, they have built some wells with takari; how many I could not say
- 223. Q. What is the cost of a well?—That differs in different localities. In Kara ralley there are wells which east lis 3,000 or Rs. 3,500. Between the Kara and the Mutha the water is about 35 to 40 fort deep; there is a rock for about 10 or 12 feet, the soil above is black.
- 221. Q. Do you think it is worth building them f-How much do they irrigated—If there are fruit trees they will irrigate about 6 acres of froit trees in addition to 8 acres of erdinary crops.
- 225. Q. Are these irrigated crops very much superior to the ordinary monscon crops?—Yes, generally.
- 226 Q. They don't grow grain crops i-Very little unless they are hard present. They grow fodder for caltle, and a grain called. Hendi for their own food.
- 227. Q. Well-to-do cultivators build their own wells?— Yev; they semetimes have to borrow money from the sencers for these wells.
- 228. Q. What interest do they have to pay to the concurs? Not more than Re. 1 per menth per hundred.
- 220. Q. What there a common well costs—In the eastern part of the district about lie, for or lie 60, because in these parts after as creater soil; simple thinging is required. A avail well can be up to for lie, 60.
- 270. Q. Ikes it carry one most Yes; the arrange would to about Re. 100 for a consens will; a tuo-most well full over about Re. 220 to Re. 200.
- 231. Q. Hen many acres will one of these wells irrigate?

  —A well with one cut will irrigate two acres of regardine and six acres of other crops, that is in particular villages, penetrals about 14 to 2 a res of engarants and 2 or 3 acres of other crops. Irrigate a by wells requires 4 to these.
- 212 Q letter a confidently amount of manus well not be the least of the least they don't not repulsive country there is sugarance with a february that the description is then the sugarance with a february.
  - 188. Q. Dother we oil calm?—I'm.
- 224. Q. Of what odf-Caster off, saffener, kernnif at describing fi brought from Diarner
  - 295 Q Tatte menti-Yes
- 200. Q. Can we, which of anything that Generalization do noticle likely to amount of the people to build nell's more than they are attentively sold to be Tropy should be given alreads with intended interest as well as within a much promote for expansion, bimply digging a wall dies not impute at least to 5 years to bring the land into anything at least to 5 years to bring the land into anything at least to 5 years to bring the land into anything in patient, ander thought for a first that invest the allowed the cultivator without interest and after that a must be taken by instalments.
- 257. 12. 11: Interest is not very ligh-5 per cent. -Pera collisioner it belight the instalments too must be
- 20%. Q Itayou is in that the instalments should be spread aver a large number of years I-Ves; that usual related to
  - 239. Q. How many years f-Certainly not less than 15.
- 240. Q. Sopposing Government were not to so, for regagainst of the principal at all lut instead of that took fall garden as comment.—That would indice them to dig 11 + 1 le.
- 231. Q. How much can Gevernment safely take on a well that of me lie 200 —Al out lie. I per arreg I think the restal infrated area only should be changed.
- use. Q. (Mr. Hilele.n)—Every year f—The average of two or three years might be taken.
- 213. Q. (Mr. Muis-Mackenzie)—A well that evits Re. 2-10 acris irrigate two and a ball some of expansive and four arms of other cross i—Yes.
- 244. Q If Government tools no wore than Be. 12, would that be sufficient -- I do not think it would impact

four acres of other crops; it would irrigate two nores of sugarcane and two nores of other crops, double-cropped; Government should only charge for the orea that is actually irrigated.

245. Q. If Government charged on the area irrigated would that he too much ?—No; core should be taken that if the well fails and there is no crop grown no assessment is charged.

216. Q. Were many wells cleared and put in order during the famice?—Not many; there is nothing to put in order in these parts because there is very little silt; the repairs are very small.

247. Q. Is there any desire to construct wells on the part of the cultivators in other parts of the Decean?—In the Poon district the onlivators are keen about wells; I do not know about other districts.

218. Q. Yon way Rs. 16 an ocre is the cost of preparing land for irrigation P-Yes.

249. Q. What would it cost a man to take two or three waterings for monsoon crops?—Rc. 1.

250. Q. He does it bimself?—Yes; he does not employ labour; he works the channel by plough and it costs nothing.

251. Q. What measures would you recommend to provent damage being done to wells by irrigation and to stop profusion of waterings?—It would require a bigger establishment. Our inspecting staff is insufficient for the purpose.

252. Q. (Mr. Ibbetsen)—Do you know the whole of the Poena district fairly well?—Yes, the whole of the costern part, right up from Khed.

258. Q. I suppose the only place where a well could be profitably mode is where the soil is fit for well irrigatioen. You could not make wells everywhere and make them pay?

254. Q. In what proportion of the whole tract do you apppeas a well could be made profitable, supposing, you had plenty of money?—Not in more than 13; my coloulation is very rough; but it is not more than 13 certainly.

255. Q. Why do you put it so low P-Because the tracts are very high and the rivers are very low.

256. Q. (Mr. Muir-Mackensie)—Do you consider the present system of assessment is as satisfactory as it could be?—I have not considered that question.

257. Q. Do you think the rates on the Nira might be raised?—On the Mutha they are just right; if they are ralsed I do not think irrigation will increase. On the Nira there is some scope for roising the water-rate a little.

258. Q. On the rabi and monroon crop !- Yes,

259. Q. Do you prefer to have orop-rate to consolidated rates - I prefer a crop-rate.

200. Q. Why? - If all crops got water at the same rate, it would be very difficult to work the canal.

# TWENTY-THIRD DAY.

# Poona, 19th December 1901.

WITNESS No. 52.-Mr. B. A. BERNDON, I.C.S., Acting Collector, Ahmednagar,

Memorandum by evitness.

### GENECAL.

. The gross area of the district is 0,590 square miles or 4,216,215 ners, of which 3,166,251 ners are culturable. About 11 million acres are cultivated in the khorif season and 11 million acres in the mbi. The population is 837,741 with a density of 127 to the square mile.

Soil.—About one-third is black soil of varying quality and the remainder ranges from red to light sandy. The area protected by Government irrigation works is 6,000 acres; by elllege norks 7,000 acres (average of last six years); and by welk 19,000 acres (average of last six years). The average monthly rainfall in the district for the ten years (1886 to

					Narambar).

Ordinarily there is no demand for water during the monmon (if favourable). The principal crops which require irrigation are:—

Sugarcano	•	40	waterings	from	April to February.
Wheat .	. •	_8	21		Novembar to March.
Ground n	nts .	_	**		June to February.
Juari .	•	ũ	n '	,,	October to Fobruary.
Gram .	•	5	17	12	October to Jonuary.

The average area under each of the principal rabi crops Mr. B. A. in thousands of acres is :-- Brendon.

Irrigation from Government works is controlled by the Inblic Works Department and the revenue is realized in the shape of a special rate collected in two instalments by the Revenue Department but separately from the land revenue. There appears to be no obstacle to the extension of irrigation nrising from spyrally of population, insufficiency of cattle or manure, unsuitability of soil or fear of enhanced ossessment. The necessary enpital for the cultivation of more expensive crops would be fortheoming if the water were made available. The uncertainty of the supply is a defect which applies only to wells and village works. Large irrigation works could be made with a reasonably recure supply. The law lays down that at a Rovision Settlement the increase in the value of land or in the profit of caltivating it due to improvements effected during the fermer settlement by the holder shall not be token into consideration in fixing the revised assessment. As far as I am aware, this principle is followed in practice. I do not think the fear of enhanced assessment enters into the farmer's calendations in deciding whether he shall build a well or not. Generally apparing, there are no tenous with leases in this district. The land-holder outlivates ble own holding. Lanes noder the Land Improvement Leans Act are freely offered and taken. More could, I think, be done if the preliminary enquiries and the distribution of the money were entrusted to a properly organized establishment with nothing except taken work to do. The rate of interest is low enough and I do not recommend a reduction. The lowest rate at which land-holders with the best scourity can borrow in the unarket is 12 per cent, and the usual rate in 21 per cent. A remission of the interest was granted during the recent femines, but I do not recommend this in ordinary years. I would recommend a partial remission (not a total remission) of the advance in the case of failure to obtain water. No extension of the prelice of repayment in necessary. The rules already allow

a takari loan and requires more money to complete the masonry. No irrigation works have been constructed during the recent famines by the Revenue Deportment. The

receipt of g

protective value of the completed irrigation works in this district was very small. The effect upon the numbers in receipt of gratatious relief or of employment on work must have been infinitesimal. Gratuations relief was found necessary in oil villages; and it impoened that relief works were opened in close proximity to the villages protected by these irrigation works. This, however, was fortuitous.

#### VILLAGE WORES.

There is a considerable number of temperary dams (bandhāras) thrown neroes streams in various parts of the district, but chiefly in Akols and Parner. These have all been constructed by the villagers who due their own clanacis and control the distribution of the woter. There is only one instance of Government assisting such works. The aggregate extent of cultivation dependent on such works is about 7,000 acres. The figures for the last six years no:

1895-1896			16,928 neres.
1896-1897			10,649
1897-1898			6,921 ,,
1895-1899			4,884
18!:9-1900	•		880 "
1900-1901			516

showing the extent to which streams have failed in the recent droughts. Land found at the settlement to be irrigable from these claumels was classed as "patasthal" and assessed with regard to both sail and water. The water and soil rates are consolidated, and it has not been the practice to grant remissions of the water-rate when the water fails. In my opinion the rates should be separated and the Collector given power to remit the water-rate when water fails. The only new work of this class constructed of halo years is a bandhara constructed by a missionary near Vambari. The work has only just been completed and has not yet been it lized. The fails of the District Local Board are not sufficient to couble it to construct works of this choracter. Gevernment has not sailsted the construction of such works either by the District Local Board are not sufficient to couble it to construct works of this choracter. Gevernment has not sailed the construction of such works either by the District Local Board are by inad-bolders, though no doubt the taking rules admit of loans being made to land-holders for the purpose. The supply of water in these channels is unmutained in a year of ample rainfall until January; in a year of scanty rainfall until November; and in a year of drought the supply finils alloge ther. Irrication from private channels is often supplemented by well-irrigation. The people have a theory that canal water is too cold for the land and that well water is warm and counteracts the bud effects of causal water. In this way fields are sometimes overwatered. The approximate average nanual rate changed by Government for the use of water taken through these private channels is \$12-13-0 per agree.

\*Note, It vates tram Besso in The rate is paid on the area found irricable at the paid on the area found irricable at the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the se

area found irrivable at the interest of the interest of the settlement. The landholder incurs no expense in bringing water to his fields through these channels. He supplies the necessary labour bimself. I think that probably all the streams with sufficient flow are already provided with bandhirans. I doubt if there is room for mony new bandhirans. Many of the old dams, however, require repairing, and Government might nestally undertake the recens which the vallagers of the present day oppear to be ino divided or too last to undertake. But, as those works depend entirely upon an uncertain rainfall, their utility is limited. The only stope for further and n-eful enterprise in this direction lies in making larger unbanktoents neroes nallahs which earry off flool waters.

## TANKS

The only tunk in this district is the Bhatedi tank, which is under the control of the Pablic Works Department.

# WELLS

The area irrigated from wells in the last six years is as follows:--

1895-1996	.,		•	65,795 acres.
1896-1897	•			120,581 ,,
1897-1898				96,809
1808-1899				100,939
1400-1900				101 289
1900-1501		_		59 703

. Defore the present senes of droughts began the area irrigated was 65,000 acres. In the first year of famine the mea rose to 120,000 acres. The effect of the continued

drought of the last two years is seen in the reduction of the orea to 59 000 nores, i.e., less than half of the area irrigated in the first year of drought. The number of new wells constructed annually during the lost ten years is not at present ascertainable. The information will, I hope, he available at the end of this month. The last return was for the fire years ending 1800-1897. During that period 4.870 now wells were constructed, giving an average of 974 new wells per annum. But judging from the very large takari grants under since 1996-1897, the number of new wells constructed in the last five years must be much larger. The amounts of takari loans made during the last ton years far well-construction and repairs are:—

						R
1891-1892						15,550
1892-1-93				•	•	15,225
1593-1894		-	Ī	•	•

1900-1901	•	•				1.24 629

1890-1900

1 do not think the fear of enhanced assessment is any impediment to well-construction. Government advances are freely taken. There is probably scope for more being don- in this direction, but any great moreuse in the number of new wells must await the replentshing of the sub-toil water-supply. One of the chief obstacles to the freer are of taken'i lanus for wells is the indebtedness of so mony landsholders who, if they have mortanged their holdings to the full value, have no security to offer. Another is the want of a properly organized cetablishment for the distribution of the money. During the famines a special establishment has been employed, but in ordinary years the work falls on the Mandadars who have little time to devote to this duty. During the famine of 1900-1991, 23 dry nells were bored by means of jumping hear, all but three with success, and more thou 300 wells were depended by ordinary means, water being found in about 80 per cent, of the cases. The secord is probably incomplete. But the attempts were made more with a view to obtaining water for dipling purposes than far irrigation, and I have no doubt that using of the wells ran dry again. There was one case in which the jamping bar struck a spring of water which spouted up and filled the well; but this was an isolated instance. The depth of perroanent wells varies from 25 to 50 feet, and the average may be taken as 35 feet. The sopphy is chiefly from percolation and is not liable to fall in an ordinary year or eccome too saline for nee. The cost of construction varies from \$250 to \$RS 0; the average may be taken as list 400. A well mee properly constructed will last for a century. The woter is invariably drawn by a leather bracket from 1 visual by any or two pars of bullocks. The average area attached to and commanded by a well is about eight neres, of whis bite area irrigated in any one year is accut three areas. The average area it as he will be anothered, for much light of the shell red, or or part of the percentage of the balling I do not think the fear of enhanced assessment is any One of the reasons for the idea not taking mote hold is that the cost of the shaft is such a small part (about \$15) of the total cost that the people do not trouble about it. Another is the want of enterprise on the part of the people. I am not in favour of the construction by Gavernment of wells in private lands. It would cost Government more than it would the landhelder, who, having to repay the cost, would suffer. Temperary wells dag in the bods of nallahs are used to a large extent but only for drinking purposes.

- 1. Q (The President.) You are Acting Collector of Ahmednigar P-
- 2. Q. How long have you been there ?-I have noted for
- sevon months.

  3. Q. Where were you before?—Mostly in Sindh.

  4. Q. Have you had any personal experience of the famine?—Chiefly from hend-quarters.
- 5. Q.\*In your district water is taken for wheat and juari steadily when the people can get it. Would a man who started a juari crop upon the water of a bandhara or by henvy rain in October, pretty readily take it if he could get it?—It would depend on the coil; if it wan black soil, he would not want it; for light soil he would take it if he could only not it form walls. he could only get it from wells.
- 6. Q. Or from bandharas ? They nro only useful for kharif crops; in a your of good rain they hold out till January.
- 7 Q. You say in your memorandum, "There appears to ho no obstacle to the extension of irrigation arising from spar-ity of population, insufficiency at cattle or manure, unsuitability of soil." Is black cotton soil not so sleep as a rule in Ahmedangar as to block irrigation or make it unnecessary?—I think not.
- 8. Q. There seem to be several varieties? There are three, I believe reorgaized by the Gazetteer.
- 9. Q. It is generally the depth that is put before as ?— In Ahmednag is black soil is not very deep. The Gazetteer distinguishes three kinds by colour.
- 10. Q. It is your belief that water boing given, irrigation should be persued on a larger seels than it has been?—
  I think it depends on the enterprise of the people; if they ore enterprising, there would be no obstrolo.
- 11. Q. By storage of the water in the hills you could very largely increase the canal irrigation; there is not a great deal of exertion required on the part of the people; your district is fairly flat?—Yes, I understand with irrigation you must manure the soil and treat it properly; I question whether the people in Ahmednegar have enough enterprise to do that properly.
- 12. Q. Yenr population is sparse, comparatively speaking : 127 to the square mile !-- Yes.
- 127 to the square milet—Yes.

  13. Q. Ynu say, "Loans under the Land Improvement Leans Act we freely offered and taken. More could, I think, be done if the preliminary enquiries and the distribution of the money were entrusted to a properly organized establishment with nothing except takavi work to do." Would you have an ostablishment to go fram district to district?—No, you would have a separate establishment for the district, as was done in the famine; it is not always done; we have been able to advance large sums.
- 14 Q. Would you have an Assistant Collector for the purpose?—I think a Mamlatdur could manage each taluka.
- 15. Q. A ceparato Mamlatine for takavi alone ?-You might give the work to a head knikan, but for large sums it would be better to employ a highly paid man.
- 16. Q. Could the Mamlaidar du that and nothing elso ?o would be enough work for him for a couple of months in the kharif and a couple of months in the rabi sensons,
- 17. Q. It would only be forn certain number of yours?—As regards wells, I think the limit has alumet been reached by reason of the sinking of the water level; there is not much scope new; it would take two or three years of good rain for the levels to rise again.
- 18. Q. When the water is low, there is not much inducement to sink wells f -There is not much profit.
- 19. Q. You show in your momorandum 3 that the area irrigated from wells dropped from 126,681 acres in 1896-97 to 50,703 in 1900-1901, which seems to point to the drying op of the wells. I suppose the dearth of cattle lms had something to do with that?—There was not a very great dearth of plough eattle; the famine did not have much effect on the wells; in some places the famine gave a great impetus to wells; they domand wells now; but the question is whether there is much object in bailding them, is they give out in the hot weather.
- 20. Q. According to your figures, they did very good work in the first two years from 1898 to 1900?—Yes,
- 21. Q. You say that wolls hold out a year after bandharas had failed; that shows they exercised some influence over the situation P—Yes.

- 22. Q. (Mr. Ibbelson).—Is the 24 million neres referred to in your report oulturable or cultivated?—One hundred thousand is coltivated.
- 23. Q. (The President.) You say talking about takavi, "the rules already allow a period of 20 years, though in practice the term is frequently not made as long as it might and ought to be;" why is that?—I don't know; the Manulatdars have a tendency to contract the term that could be rangeded by accounting orders. could be remedied by executive orders.
- 24. Q. You say only one new bandhara has been constructed P—Yes, that is on an agriculture farm belonging to the American Mission by Mr. Bulluntine, a very enterprising
- 25. Q. Yon say, "Irrigation from private channels is often supplemented by well irrigation. The people have a theory that canal water is too cold for the land, and that well water is warm and counteracts the "bad offerthe canal water." Do they pump the worm water after the cold ?-Yes,
- 26. Q. And thereby give too much water?—I have no personet experience of that; I have been told so.
- 27. Q. You say, "The only tank in the district is the Bhatedi fank, which is under the control of the Public Works Dopartment." Are there remains of old tanks or any indications that it was a tank district?—No, I believe come village tanks were constructed in the famine of 1876, but they have all gone out of use.
- 28. Q. (Afr. Ibbetson.) Is that for drinking or irrigation?—I am not sure; I think for drinking for outile.
- 29. Q. (The President.) They have not been kept up?—Nu, pruhably they were not well constructed.
- 30. Q. Takavi loans are given for many things besides wells; what are they chiefly P-Seed and cattle.
- 31. Q. (Mr. Muir-Mackenzie) Are they ever gifor manure?—No, I think not; certainly not expressly.
- 32. Q. (The President.) Is any artificial manure used?
- 33. Q. (Mr. Muir-Mackenzie.) Not easter oake ?-
- 31. Q. Nor fish mannro P-I won't answer that In the negative, but I never heard of it.
- 35. Q. (The President) You say in your note "the massessment on laud irrigated from wells is not much higher than the dry erop rate. It ranges from Rs. 2-7-0 in Akola to Rs. 0-6-0 per agree in Knjat." That is extremely low?—Yes, it is very low throughout the district. Karjat is a poor taluka. That paragraph refers to land rejected on wells. Karjat is about the warst part land irrigated on wells. Karjat is about the worst part.
- 36. Q. Who there great loss of life in Ahmednagar during the famine?—The last census shows a decrease of 50,0.00, but I think a large proportion of that went to the Nizam's territory; the decrease was chiefly in the border talukas; at that particular time labour was to be got in the Nizam's territory.
- 37. Q. From your experience what do you think would be the hest protective measure for Government to adopt to make your district better fitted to withstand a famine, than it was three or four years age ?—I think there is only one, to utilize the streams and nullahe.
- 33. Q. That is, to store the water instead of allowing in to go to waste?—Yes.
- SD. Q. (Mr. Muir-Mackenzie.) You would not advocate the multiplication of wells?—Cortninly not at present. I think the sub-soil water will not rise for come years ; it is sinking fast.
- 40. Q. I suppose that materially diminishes the number of wells working !- Yes.
- 41. Q. (Mr. Higham.) Can you say what is the actual area cultivated in Ahmedangur in the worst famine years?— I'm nfraid I have not the bgures.
- 42. Q.—I suppose there are figures?—(Mr. Muir-Mackenzie.) Only figures of the area sown could be given, not of the area that comes to maturity.
- 43. Q. With reference to the bandharas that you refer to, what rivers are they situated upon P-They are situated on streams, tributaries of the rivere, not on
- 44. Q. There are none for instance on the Mula river ?-I canuot say.

Mr. B.A. Brendon.

19 Dec. 01.

Mr. B. A. Brendon. 19 Dec. 01.

- 45. Q. (Mr. Muir-Mackenzie.) Are they palkaban-dharas or kachcha?—They are kachcha; they have to be ropoired every year; they are kept up by the villagers.
- 46. Q. (Mr. Higham.) In the event of storage works ing constructed, the immediate result would be to greatly these bandharas, hy giving them a regolar —Yes, if you had bandharas on streams.
- 47. Q. Suppose you had a bandhara only a streom at the head of which you could construct a storage work, the efficiency of that bandhara would be greatly increased, but would Government have any means of getting any revenue on account of that. The revenue is fixed on this bandhara!—Yes, there is a coosolidated revenue on the bandhara.
- 48. Q. If we were to store water at the head of the rivers the bundharas would get u much hetter supply, and we would he able to get nothing out of them; they would get the first pick of the extra supply?—I suppose so.
- 49. Q. (Mr. Muir-Mackenzie.) If there was un in oreased area brought under oultivation, Government would be able to chorge revenue on that?—Yes.
- 50. Q. (Mr. Higham.) You say that the approximate average annual rate charged by Government for the use of water taken through these private channels is Rs. 2-13 per acre. That includes the soil tote also ?—Rs. 2-13 is the whole rute.
- 51. Q. I see that Mr. Lamb very strongly recommended the construction of the Maladevi tank; do you egree in his opioion that it should be donof—Entirely.
- 52. Q. Do you think if the Maluderi tank was constructed and a regular supply down the Prawara river, there would be any demand for water in ordinary wet years?—I think experience says no. I suppose there would not he very much demand in a good year.
- 53. Q. People can got very good crops without irrigation f—They can get enough; they are net ambitious.
- 54. Q. Don't you think they would endoavour to fotro-duce a higher class of crops if they could get an assured supply of water?—Not on a very large scale.
- 55. Q. You think the muse of the people would be centent to get their crops without paying a water rate?— I think so; I think they would noly toke water ou a large scale if rain threatened to fail.
- 56. Q. What do you say ubout the Visapur tank f-I suppose the same remark holds good.
- 57. Q. I don't mean whether the people would take water, but whether it would afford any protection at all?—Undoubtedly; I think the tank will fill.
- 58. Q. Do you think it should be completed ?—Yee, nn-doubtedly.
- 59. Q. How long hove you been in the district?—Ten months altogether.
- 60. Q. Have you seen auything of that work ?-Yes.
- 61. Q. As a relief work, has it been a good work for em-ploying labour on f-Capital; we have had 11,000 people on it far a long time.
- 62. Q. Would you like to keep it in reserve for another famine or complete it at ouse?—I should complete it ut
- 63. Q. (Mr. Ribetson.) You said just now that in a good year people would be content without irrigation?—That is my private opinion.
- 64. Q. Can you give us any idea what proportion of years would come under that description of "good" years; ont of five or ten how many ?—No, but the had years come in cycles in Ahmedusgar; the last eix years have been ull bad
- 65. Q. We have been told that in the Deccan out of five years there is one good crop, two middling, and two bad; doce that apply to Ahmednugur?—Yee.
- 66. Q. Does that apply to the rabi who; do they grow their rabi ordinarily on rain only F-No, only the best soll grows rabi without rain; at the ond of the year their rabi has to he irrigated from wells.
- 67. Q. Supposing water was available from n tauk or caual, would they toke it in au ordinary year?—Yes, for the rabi.
- 68. Q. Do you think that the rabi area could be extended if they had plenty of water?—I think it very likely if they were not hard pressed; when there is a famine, they try to get some crops at onco.

- 69. Q. You say in your note "I do not thick the fear of enhanced assessment enters into the farmer's calculations in deciding whether he shall huild a well or not." Do you think that thot consideration does not weigh with him one way or the other, or is it the case that he has no fear that there will be cohancement?—Purtly both, partly because he is reasonably sure of making enough profit.
- 70. Q. You don't think he knows forcertain not only that it won't be high, but that there won't be uny at all?—I don't think he knowe the law.
- 71. Q. Still you don't think that such fear as he has ever prevents him from making a well that he would otherwise moke?—No.
- moke?—No.

  72. Q. Yon eay "I would recommend a purtial remission (not a total remission) of the advence in case of failure to a that in water." We have been told by many witnesses that they object to that on the ground that it would lead to extensive frand; it would be impossible to find ont how much the man really spent on the well or on a marriage; etc.; do yoo think that would be a practical obstacle?—I think not if there was a exceial officer who had time to enquire into these metters.
  - 73. Q. Do you think an enquiry should be mode?—Yes.
- 74. Q. Your wells irrigated 65,797 acres in 1895-96 and 126,581 acres in 1896-97; that was a fumine year !—Yes.
- 75. Q. Does that mean that your wells had not been fully worked before or that o great number of now wells had been dug f-A very large number were dug.
- 78. Q. Then they must have been made kachoha !--Yes; they struck rock very soon.
- 77. Q. You say in your nole, "A grant-in-nid might usefully be given to a man who has alreedy dug a well by means of a takevi loun and requires more menoy to complete the masonry "P—That seems to me u most admirable soggestion.
- 78. Q. (Mr. Muir-Mackenzis.) Do you meon without repoyment?—Yes.
- 79. Q. (Mr. Ibbeison.) Can you say how many of these wells in 1896-97 were dug quickly and left just as they stood?—I cannot say.
  - 80. Q Were many left in that way P-I cannot say.
- 81. Q. You say, "No irrigation works have been constructed during the recent famices by the Revenue Department. The protective value of the completed irrigation works in this district was very small. Which do you refer to?—To the Ojbur left bank und the Lakh canal, also the Bhatodi Tank.
- 82. Q. What happened to thom that they were not a success ?—The water-supply failed.
- 83. Q. I suppose there was some woter ?—I think not; the supply failed early.
- 84. Q. You say, "The approximate average monual rate charged by Government for the ose of water taken through these privule channels is Rs. 2-13 per acre." Can you say how much of that is for water and how much for land revenue P—No, the figures are available in the village records.
  - 85. Q. Is that consolidated !- Yes.
- 86. Q. We have heard that Re. 1 is taken on account of water; do you think that a substantial reduction of that would stimulate the construction of these kachcha bandharas?—No; there is no co-operation among the people.
- \$7. Q. As a fact, they do make these bandharas; why should they not control their distribution in more cases?—Becone there are no more streams, there is no more room; whatever little water there is is taken up.
- 88. Q. Have these streams been examined professionelly? No, my point is that there is no more bandharas, not that there are no more sites.
- 89. Q. You soy, "Muny of the old dams, however, require repairing, and Government might usefully undertake the repairs." What is the use of them if the water is already repairs." What is the use of them if the water is already taken up?—Well, I think it is possible some of these would be more useful if they were thorughly repaired, the villagers are not intelligent enough to repair them themselves.
- 80. Q. (Mr. Muir-Mackenzie.) I understood they were all kachcha i—Yes; I believe so, there ore two dates in Akola, which have heen repaired by the Public Works Department; the Savagoa is one.
- 91. Q. (Mr. Ibbeisan.) Would these bandharas be second class irrigation works f—(Mr. Muir-Mackenzie.) Not unless they are in charge of the Public Works De-

15.4

- 92. Q. Can you suggest any reason why tank irrigation is practically unknown in Ahmednagar ?—I suppose it is the conformation of the ground.
- 93. Q. Have you any country which prima facie would be suitable for tanks?—Do you mean tacks like these in Konkan for storage of roin water?
- 94. Q. I mean some with cotohment orens of their own ?—I think there are pleaty of sites.
- 95. Q. Why are they not made use of as is deno elsewhere?—I suppess they were beyond the moons of the people.
  - 96. Q. Do they grow rice P-Yes, in Akola only.
- 97. Q. Are there my tanks in Akola?—No, my opinion is that a couple of good showers would fill ony of these village tanks, but they dry up quickly.
- 98. Q. You say in your note that something like 1,000 new wells per annum hare been made in the last five years?—No, during the five years ending 1896-1897; since that year 8,300 wells have been dug.
- 99. Q. So that wells were increasing at the rate of o thousand a year before the bad oycle came?-Yes.
- 100. Q. Looking at the coop of well irrigation and the fact that more labour, more calle, and more manure are required, do you think that that rate of a thousand per your could have been advantageously increased very much, supposing there was plenty of money available?—I dareasy I find that of the wells made since 1896-97 only one-well were made from taken and the vest from private capital.
- 101. Q. One would think that the famine would apply a strong stimules to the construction of wells ?—It also dries up capital.
- 102. Q. De you think that the number might have been largely increased if money had been freely available?—Probably more wells would have been constructed, but I doubt if the advantage would have loon great, because the mater level has been sinking so much.
  - 103. Q. I suppose a wall protects about 3 nores?-Yes.
- 104. Q. I suppose there are large tracts in Ahmedeagar in which wells could not have been sunk, or profitably worked?—There may be fields, but not tracts.
- 105. Q. Do you think over the greater portion wells could be sunk and worked with profit if people had the enterprise and money?—I suppose they could if there was a supply of
- 109. Q. Supposing you made all the wells that a man could desire and that he could work with profit, what area could be protected; is une-tenth rory much below the mark for Ahmednagar?—I question whether it would be more.
- 107. Q. You say in your note?—Any great increase in the number of new wells must awoit the repleuishing of the cob-soil water-supply." That means until the present cycle is over and we get better years?—Yes.
- 108. Q. Have you experienced the anti-soil water-supply failing not on account of bad years, but broanse too many wells have been made close together?—No. I have not studied that question.
- 109. Q. Have you beard of it ?- I have always assumed
- it as a fact; I have you heard of it?—I have always assumed it as a fact; I have not enquired into it.

  110. Q. You say, "Expert salvies has not been provided, nor is it education that it should be provided." You say you have a boring machine already; is it for deepening a pit already deg?—No, it is a drill for trial boring.
- 111. Q. That has not been n success?—No, because it is so fragile. I think a long jumping bar is more suitable for a trial horiug.
- 112. Q. Supposing that the machinery is simple and effective, would you say it is not advisable to get it?—You would want such a number, you cannot carry these things alout like we jumping bar, and you would require skilled aupervision.
- 113. Q. Would you recommend the p jumping bar!—We have one in every taluka. provision of a
- 114. Q. Are they much used?-It depends on the Mamiatday.
- 115. Q. D: you think people appreciate the use of them?—There is not much competition for them.
- 116. Q. Has there been a case in which it has been really useful and where loss of money has been prevented?—I cannot say.
- 117. Q. (Mr. Rajaratva Mudaliyar.) You say, "Tho areo protected by Govorument irrigation works is 6,000 acres."

- .Do you mean by that protected in all sonsono, or do you refer to the irrigable area only f—It means the area actually irrigated. I soppese commanded is the proper expression.
- 118 Q. In o formins year the whole of that area will not 19 Dec. 01. be irrigeted P-No.
- 119. Q. You say "the rate of interest is low enough, and I do not recommend a reduction. The lowest rate at which lendholders with the best scenrity can borrow in the market is 12 per cent." We have been told that agriculturists find difficulty in borrowing owing to the power of alienotion boving heen restricted. Is there any truth in that etatement?—It is too early to say yet; I think the matter will right itself; there has not been much horrowing since the Ast was record. borrowing since the Act was passed.
- 120. Q. It is dee to the famine? Quite es mech us to the recent Act; partly, too, the season of making wells in only now coming ou.
- 121. Q. (Mr. Muir-Mackenzie.) As a matter of fact, the area on which alienation was restricted in your district is insignificant?—Yee.
- 122. Q. (Mr. Rajaratna Mudaliyar You say, "I hand foundnt the estilement to be irrigible from these channels was classed as "patasthat" and assessed with regard to both soil and water." All such lands are, I suppose, liable to pay a consolidated assessment, whether irrigated or not?—All those found irrigable of the settlement.
- 123. Q. Is any large portinn of the land left unirrigated P-No, I think not; if they cannot got water, they can apply to the Collector, and with the approval of Government got the consolidated rate removed.
- 121. Q. What would be the reduction in the consolidated assessment in such a case?—I think the water rote is represented by about Rs. 2.
- 125. Q. You say "the approximate arroge annual rate charged by Guvenment for the use of water takes through these private changes is Rs. 2-13-0 per nore," and you explain in a marginal acts that it varies from Rs. 6-8-0 to Rs. 0-11-0, aby does it vary so much?—(Mr. Muir-Mackenzie.) According to the character of the supply.
- 126. Q. Supposing that a rayat brigated a portion of rivate had by means of bandhara constructed at his own cost, what would be be charged?—The rule is that an officer goes and inspects the bandhara, discovers how long the apply is likely to last, its capacity and the area irrigates; he then puts on a rate conforming to that of similar bandharas that were assessed at the last settlement in the vicinity.
- 127. Q. Referring to the Bhatodi tank, I find the revenue is given in Mr. Beele's statement as Rs. 5,799, while the working expenses amounted to Rs. 7,723; what is the reason of that f-I think the silting up of the tank had something to do with that; the Poblic Works Department will be oble to explain.
- 128. Q. Referring to statistics of area irrigated under wells, do you think the figures can be accepted as reliable?—I think the figures are approximately correct; there is a triple check on them, the figures being checked by the Mambatday, Assistant Collector, and Circle Inspector.
- 129. Q. (Mr. Mair-Mackensie.) About these wells, 1 see you have given an increase in their number between 1896-97 and 1901-02; that increase began with 1897-98?—Yes.
- 130. Q. In contrasting the number of wells that have been made during that period with the number that have been made during the five years previous, it must be remembered that a large number of wells were made in 1896-97 ?—Yes.
- 131. Q. Then ngain, I natice, that in the famine year you had 1,234 pakka wells; is that so ?—That is not for that year alone; that is a statement compiled in that year, which shows the wells constructed since the last famine sinco 1806-07.
- 192. Q. As regards manure, did you say that you noticed the people are buying cake ?—No.
- 193. Q. I think I have heard that they are; have you heard that there is any conservation of rofuse and night coul in the villages going on !- No.
- 134. Q. It is not only going on in the towns, but also in the villages they are beginning to learn?—I have not noticed it, but then I have not foured very much in Ahmedangar.
- 135. Q. Do you think that the system of assessment of rates varying with the coops, so much for rabi and monsoon crops, etc., and determining the emonant of assessment by fuspection is in every woy a suitable system, or do you prefer the Sindh system of a consolidated rote?—I think you would have to split up the numbers.

Mr. B. A. 19 Dec. 01.

- 136. Q. If you split ap the numbers?—I think the Sindh system is probobly better, as it does nway with the chones of fraud on the part of the subordinate agency. I think the management of these works by the people themselves is better if it could be done.
- 137. Q. Can you suggest any method by which it could be done?—Not on u big canul, but on villege works and small tanks; the people are certaintly better qualified to manage the distribution of water themselves.
- 138. Q. The small tanks ure under the Public Works De artmont P—Yes; for justance; the Gouda tank; the Pobli partmont?—Yes; for iustance; the Gouda tank; the Poblic Works Department repair it and the villagers muuoge it.
- 139. Q. Woold you prefer to see extended the system of village management?—Yes.

  140. Q. (Mr. Ibbetsou.)—That implies fixed assessment?—Yes.
- 141. Q. (Mr. Muir-Mackenzies)—You said that experience seems to suggest that irrigation from these Government works would not be much reserved to in good years; i want to know what experience ?—Woll, I cannot say I have had moch experience.
  - 142. Q. It is more an impression than experience?-Yes.
- 143 Q. You have never, for instance, studied the progress of irrigation on the Nira Conel?-No.
- 141. Q. You said that the Visapur tanktwould fill; what do you go upon; the aspect of the country does not seem very inviting ?—I have not studied the question; I have noticed the floods that go down; I think they are sufficiently large to fill these tanks.
- 145. Q. Do you think that was a good selection for relief labour, or would you prefor to see it concentrated on another tank, way the Maladori tonk?—Ye-, I presume I should if it wers practicable; the Maladori is certain and the Visapur is not certain.
- 146. Q Do you think the Visspur was taken because there was no alternative?—I cannot say.
- 147. Q. Is there any other form that you can think of in hich famme relief work could be employed to advance irrigation as advantageously as these big tanks?-No.

- 148. Q. What about thats lerracing the country?-I personally prefer tanks, large and smoll.
- 149. Q. Bonding up of smoll streams?-Well, I was thinking more of honding up nallahs which carry off flood
- 150. Q Would it he compatible with effective supervision do that as a famine work?—I think so ; it is a question of establishment.
- 151. Q. You think that the period of repayment of tskayi advances for well building should be extended?—I think the Mamiatdam don't make the term long enough in many
- 152. Q. Can you give any reason why a restriction should be mode; why not give as lung a term us the rayat wishes?—I think there should be a limit.
- 153. Q. Why, suppose he pays the interest?—Would that not reduce the amount of money available with Government for loan to other people?
- 154. Q Allowing that Government might have to consider that, we hear that rigidity in the collection of installments is one of the great drawbacks to the system, so long as the interest is paid, why not allow the rayat to postpose the rapayment of his instalment; do you think he would look upon it with satisfaction?—I think he would! I was thinking the abjection from a recover point of size at the abjection from a recover point of size at the abjection. ing of the objections from a revenue point of view; I have not considered the question.
- 155. Q. (Mr. Ibbetson.)—Cnn you say what the ordinary cultivator has to pay for loans from a bania to make a well?—Generally by 24 por cout.
- 156 Q. Have you given takevi this year for wells?—No not yet, the time is approaching.
- 157. Q. Do you propose to lengthen the period for recovery beyond what the Mamiatian recommends f-I propose to issue orders to the Memlatdar to that effect.
- 158. Q. The Collector has full power ?-Yes up to 20

WITNESS No 58 .- REVD. H. FAIRBANK, American Mission, Vadala, Taluka Novasa, District Alimediagar.

Answers to printed questions.

Rend. H. Fairbank. 19 Dec. 01.

- 2 The soil in the Ahmednagar district varies from heavy black soil to light and sandy. In an ordinary good rainy season no portion of this soil is dependent upon irrutation except for special crops, as so arcenc, lucerne, etc. The kharif or tany season crops are planted from the 1st of June to the end of July in the light soils, which require repented rains and which do not become unter-logged. The rabi crops of juari, wheat, and gram are sown in September and October on the heavier black soil, which needs no rain to develop a crop if it is once saturated. Cotton is sown in June on black soil and flowers in September and October. The kharif crops no not untered in ordinary years. Juni and wheat are both untered whenever it is poscible to do so. Juari is watered three or four times, November to January. Wheat needs more unterfit is watered at all. Both juari and wheat give good returns on black soil without irrutation. By watering the yield may be doubled and the circ and weight of the grain may be very much increased. Crops that must be watered are segarante vegetables.

  3. There are no tanks that I have seen constructed in
- 3. There are no tooks that I have seen constructed in B. There are an arms that I have seen constructed in deep black soil. Thore may be a black soil embrakement, but the hottom needs to be rocky. (There are small tanks at Bhamani, Yadala, Takli-Bhan, Bhokar, etc.) None of these tanks are used for irrigation, but are osed to supply diinking water to entite and for bathing. Even in the richest black soil justi and wheat are irrigated, if possible. The owners of fields along the Lakli Canal we water whenever there is evonets. In good years it is used meter whenever there is e-sough. In good years it is used freely. In years of drought it would be used still more freely, I have no doubt, if the supply were abundant. Irrigoted huds need plongbing often and to be manured; otherwise they soon are exhausted.
- 4. The only work of importance that I personally know of is the Lakh Conol. This canal has little water in times of drought. Tanks such as are now being built or proposed near the sources of the Mula and Pravara promise to be

- of great use ia storing water for other reservoirs forther down the stream.
- of great use is storing water for other reservoirs farther down the stream.

  6. There are no small tanks in this district used for irrigation. Those now in existence supply dinking water to cattle. There are not any of them, as far as I know, of Government construction. Some are the pits of quarries. The configuration of the land prevents the construction of large touks escept at the base of bills or in the teds of rivers. Tanks at the base of the hills extending cast from Yambort would be useful for Irrigation. Inthe hilly districts of the Parner and Nagar talukas such tanks should be feasible and useful. The rivers generally run very low compared with the surrounding territory, and can is from them would be limited in neftulness. Storing water at intervo's in these rivers would solve the purpose of supplying water to wells mear the riverside. Soch wells were used very freely in 1897 and 1898. Since then the rivers have run dry, and the bludkis, as they are alled, have been usels. Dams at intervals across the many streams that run from the hills on the south to the Muln, the Pravna, and the Godavara Rivers would have been of matold value during the last five years, for an enormous amount of water runs to waste through these streams. The channels of these streams are deep and narrow at many places. As already mentished, the small tanks scattered through the district have been useful in supplying water for cattle. They become so foul that men will not drink the water.
- 7. Wells supply practically all the water used in irrigation in this district. In addition to wells existing before the familie, many new wells have been dup by means of takuvi loans, and aid wells have also been despend. It is a pity that many farmers have squandered the loans given them, but etill the amount of good accomplished has been great. It should be remembered also that wells are expensive, and that 500 rupees may be practically useless without another 100 rupees to finish the job. I know of wells that are built up and in which there is a little water.

Another lean of a lundred rupees would probably make these good wells and double and troble the value of the land; without this sum, the well does nothing. Improper ase of takavi leans may be partially prevented by giving the money in inetalments and requiring the first inetalment to be properly used before another is given. It should be remembered, however, that some of the first instalment of takavi invariably goes into the podects of the patel and kulkarnis. Towas favoured by goed wells have preserved their cattle alive, and their inhabitants have not been on relief camps, e.g., the town of Jenr in the Nagar taluka and the towns along the Sina River below Almodangur. On the other hand, wells have their limitations. The last two years have seen a great diminution in the amount of water in the ground. Some wells have dried up altogether, and the capacity of most has been reduced to one-fourth, or even less, of the ordinary capacity. The ground seems to have dried up clear down. Some wells have been deepened with excellent results. The majority of those deepened have been helped Wells 60 or 70 feet deep are profitable if they have abandant water. In sume towns water lies within 20 or 25 feet of the surface; such towns are few. The average well is over 30 feet, down to 50 feet, deep. A good well cannot be dug for less than 500 rupees ordinarily. Many cost up to 1,000 rupees. A well that will water 10 acres adequately is rare. It should be remembered, however, that sugarcane and gardon vegetables need very much more water than juari or wheat. So the statement as to the amount of land that one well will water depends on what crops are meant. There are one or two wells that I know of that are as id to water 20 or 25 acres, but a great part of this land is in juari and wheat. There is not an unlimited amount of water is the ground. An increase of wells in many cases decreases the supply of old ones near by. This is especially the case when there is a porcus similum through which the water comes. There is plenty of r Another loan of a hundred rupees would probably make there

#### II.

# A .- GENERAL.

I have knowledge of the Nevasa teluka in the Ahmednagar district and of parts of the Nagar teluka.

- 3. There is no obetacle to the extension of Irrigation-
  - (1) from eparsity of population,
  - (2) from insufficient supply of cattle.

There is an obstacle at present because cattle have died in the famine. Befure the famine there were enough.

- (3) At present manure goes to waste. Increase of Irrigation will bring in more cattle and increase the amount of manure.
- (4) Seil (even black cotton) is suitable for irrigation if worked proporty and manured.
- (6) If the supply of water were insured, I believe that there would be capital to invest. There might be trouble about the initial expenditure in the present poverty of the farmers.
- (7) No one ever has meationed this fear to me.
- (8) Not that I know of.
- (9) Wells are exponeire to operate, and this does in good your prevent extension of irrigation for the more expensive crops as sugarcane, etc. The fact that farmors have not credit with money-leaders on account of laws ouncted in 1879 and lately is given as a reason for their not being able to obtain money when weeded

- 5. Loans have been freely taken by the peopls for dig-ging wells; and a great many wells have been dug.
  - (1) Perhaps the rate of interest could be reduced.
  - (2) The interest should not be entirely remitted.
  - (3) and (4) Remission, partial or total, in case of failure to obtain water might be a good thing for those who have honestly tried to use the loan, but the trouble would be that a general policy would lead to abuse of takavi loans.
  - (5) I believe that the period of repayment of present loans should be extended on account of the distress caused by the famine.
- 6. Extension of irrigation has not, as far as I know, tended to injure the remaining cultivation.

The increase of irrigation is greatly desired.

#### E .- WELLS.

24. In the Novasa taluka-

- (1) Wells average from 30 to 50 feet doep.
- (2) Water comes both from epringe and from par colation according to the nature of the

They do not fail except in severe drought. There are tracts where the water becomes too saline to use. Such ore avoided by the people in digging new wells. Any well will gradually diminish in capacity through the hot weather oven in ordinary seasons.

Wells through this district within 12 mouths have very seriously diminished in capacity. Many have only ene-fourth or less of the water of ordinary years. In some towns wells have practically dried up.

- (3) Wells cost from 500 rupees to 1,000 rupees.
- (4) A well once built should last for ever.
- (5) Water is drawn here always by a leathern bag called a mot.
- (6) The capacity of a well is measured by the number of mote that can be used on it.

One mot will water 3 or 4 acres of juari or wheat, but less than half that of sugarcane or garden vegetables.

- 35. Irrigation increases the value of the produce.
  - (1) Iwo harvests are possible. Generally bajri or khondi is planted in the rainy season followed by wheat or gram.
  - (2) Sugarcane and pea-nuts, etc., are substituted where the farmer can bear the initial expense.
  - (8) The yield of junri and whoat is increased, and the size and weight of the grain are increased.
  - (a) In a your of ample rainfall, the yield is sometimes doubled or at least becomes half as much again.
  - (b) In a year of scanty rainfall, instead of a poor crop a good orep can be obtained.
  - (c) In a year of drought, in place of nothing a fair erop at least may be obtained.
- 88. (1) Where there is ruck to be blasted, there the dig-ging of a well is a kind of lettery. You may strike a spring and you may not.

When there is a porous and soft substratum, there a well can be sunk almost anywhere, and water obtained.

- (2) Wells dug in deep loose soll are difficult to wall up.
- 40. Temporary wells are not in use in the Nevasa taluka, because the water lies too deep below the surface.
- 1. Q. (The President.) You are, I understand, a Missionary in Vadala ?-- Yos.
- 2. Q. How leng have you been there?—Siece 1886; I have bad more or less experience there.
- 3. Q. Were you there through the famine?-I was through the first famine, not the last.
- 4. Q. Have you studied agricultural matters?—My father was very much interested in agriculture, and as I go round I notice things, but I have no scientific knowledge.
- 5. Q. (The President.) You say in your memorandum 19 lu an ordinary good rainy season no portion of this soil is
- dependent upon irrigation except for special crops as engarcane, lucerno, etc."?—Yes, erops are raised anywhere in an ordinary season without irrigation.
  - 6. Q. Does that include ordinary rabi crops ?-Yes.
- 7. Q. You talk about the ordinary rainy season; up to when does that mean?—They got the heavy rains in September.
- 8. Q. If there is no rain after the 1st of October?—If the rain begins on the 1st of June and lasts to the middle of August, and then there is a break, and the heavy rain comes in September, these are sufficient for the rabi crops.

Revd. H. Fairbank.

19 Dec. 01.

- Rerd. H.

  1 airbank.

  10 Dec. 01.

  10 Dec. 01.

  11 Dec. 01.
  - 10. Q. What is the last date that they now jourf and wheat, assuming that the rains have lasted to the end of Soptember ?—June in the last week of October and wheat not before the end of October.
  - 11. Q. Will the heat of October not burn up the junei!—No, it is better to sow at the end of September, but it eyem sow it at the end of October, as seen as the ground is in proper con lition.
  - 12. Q. You have bet experience of a district that her cultural receive?—Very reverse, I have unideen quities as I touted and have not been able to district a simple death from starration, because everythely who needed it West on trhel works.

- 49. Q. (Mr. Muir-Mackenzie.) You don't think they could do with less water than they take ?—Mr. Knight thinks the fields are overwatered; if a cultivator were used, less water would be needed. The trouble with sugarcone is that we account out into the fail to articlate it. that you cannot got into the field to onlile ato it
- .50. Q. Havo you boord that they water cotton ?-They sey irrigation produces disease in the plants.
- [(Th. President.) In Egypt it is watered once a fortnight teadily ?-(Witness.) I only say what I have heard.]
- 60a. Q. (Mr. Higham.) None of these public works that have been proposed, the Maladevi, etc., would be of any benefit to Vadala, would they F—Yes, the caual from the Baragae Nandur Tank near Rahuri would go within a mile of it.
- 51. Q. You say in your momorandum, "The khorif ar rainy scaron crops are planted from the 1st af June to the end of July." I suppose there is no rice oultivation?—Yes in a good season they plant a very coarse sort of rice that does not need much water.
- 62. Q. I suppose the reason is that there is generally not enough water for it ?—Ves.
- 53. Q. If a more regalar supply of water were given by means of tanks, do you suppose that any of this kharif cultivation would be converted into rice cultivation?—I cannot say. I rather think not ; instead of going into rice, they would go into sugarcane, red peppers, ground nuts, and gardon regotables; wherever there is a well, they plant these things.
- 54. Q. Yan don't think there is much danger af the land being converted into rice cultivation land ?—No, our people don't enjoy eating rice.
  - 55. Q. Da they graw cottan P-Yes, a great deal.
- 56. Q. (Mr. Mair-Mackenzie.) Is it much ?—It varies from year to year; their idea is that cotton has to he sown before the end of June, and requires heavy rain in June.
- 67. Q. (Mr. Higham.) These bands across the stream would not store water ?—Yes, they would.
- 59. Q. What beight ?- In some places 10 to 15 feet high.
- 59. Q. The water would be comply ctorage and allowed to percolate through ?—Xes.
- 60. Q. You would not lift it ant P-No, except by wells at the sides; I think, it would holp oxisting wells; the principal nee would be to help wells near by the river, I think anybody who need a hurki or a well fed by a running stream, is charged an extra rate.
- 01. Q. (Mr. Ibbetson.) Do you think that the charge for the use of water of armning stream prevents the people from using it materially !—No, it is not a high charge.
- C3. Q. Yau consider that in a good year crops can be grown anywhere without irrigation; still Irrigation would improve the crops in the best of years ?-Yes.
- 63. Q. You spoke of the uncertainty of the supply af weter; suppose the sopply was absolutely secured, do you think that they would use it in the best af years far the sake af that improvement?—Yes.
- 64. Q. If the supply was seener, they would take all the water that could be given ?—I believe so, they would then cultivate more expensive crops, but they would also irrigate the rabi crops.
- 65. Q. Yau say you have heavy black soil in Ahmednager; is a lorge proportion of the cultumble area on that ?—It is in spots and villages; it is most provalent near large rivers.
- 66. Q. Is there an extensive area altogether ?—At Vadala there is not much, at Kharvandi half is black sail.
- 67. Q. Taking the whole district, roughly ?-It would not come to one third probably.
- 69. Q. At any rate, you put it at one-fourth ?-Yes.
- 69. Q. Would they water heavy black soil?-Yes.
- 70. Q. What is the grentest depth of block soil that they irrigate?—I cannot say. Along the hills there is no black sail; there is some as you get away from the hills to the flat open country; some villages are entirely kharif and some onlitely rubi; there is kharif on the high lands and rabi on the low.
- 71. Q. You say, "Irrigated lands need plonghing often and to be manured, etherwise they soon are exhausted." Da yau say that from yaar own experience ?—Yes, one year without manure made a difference.
  - 72. Q. Is that poor soil ?- It is the richest soil we have.
- 73. Q. What makes yan think it is the absence of manure f-There is no other reason.

- 74. Q. (Mr. Mellison.) If you water black soil one Revd. H. year, you will get a gaed crop, and not the next year?— Fairbank. Unlivators say the same thing; they say manure would have prevented that.
- 75. Q. (Mr. Ibbelson.) Why, are thore no small tanks for rice irrigation in Ahmednogar ?—At Vadala I don't know af any place where you could have a tank.
- 76. Q. I mean village tanks to water say 70 to 80 acres? —I don't think you could got a place where you could otore eaough of weter and raise it to flaw aff by a ahannel.
- 77. Q. You are not hapeful about taske?-Ne, sot about small tanks.
- 78. Q. A great number of wells were made in 1896?-Yes.
- 79. Q. Do you know how far they have been finished up with mesonry as far as that is necessory? I asked that question; the village officers said three-fourths had been finished.
- 80. Q. Do yau think the romaining quarter has not been suitabled, because they are not good wells, ar hecause there is difficulty about money P-I presuma both.
- 81. Q. There has been a lot of money spent an these wells, and if they are left as there stand, they won't last; do you think it would be worth while to give email sums as grants-in-aid to put in this masoury and so make the well a permanent one?—Yes, I believe in good wells.
- 83. Q. Do you think the people would be roady to take the money as an ordinary taken loas P-Yes.
- 83. Q. What is the difficulty ? Rs. 860 has been received and spent; they still require another Re. 100; would that be refused P—Yes, I know one man's application that has been refused by the Mamlatder several times, I think also there is another reason: there has been a limited amount of taken of recent years, and when new applications como in, they are given precedence.
- Bt. Q. Surely it is better to give Rs. 100 to provent Rs. 300 going to waste than giving a loon for a new well ?—I think so: I know a village in which there are three wells, which it wauld cost very little to complete; until they are completed, they are useless.
- 85. Q. Do you think the people would be ready to borrow the money?—Yes, on all wells requiring Rs. 200.
  - 86. Q. Have they asked for it ?-I am not quite sare.
- 87. Q. Are you herd up for money for takeri, Mr. Brendon?—(Mr. Brendon.) No.
- (Witness.) There is difficulty with the kulkarni; bo demands money for himself, and would block the way. I think that is the real hindrance.
- 88. Q. You propose to give out money by small instalments as work goes on P—Yes.
- 89. Q. Yau say that come of the first instalment would stick on the way ?— Yes, it always does.
- 90. Q. Would some of each instalment stick ?-It would depend on how it was done.
- Ol. Q. Would that not be a considerable difficulty?—It seems to me that Mr. Breudan's recommendation of a Mom-laddar going round and distributing money would be a capital one; it is the subordinates that keep the money.
- 92. Q. We have been told that the worry and delay af going to head quertere would be an obstacle; still da you think the meney would be given in small instalments?—I think it would be a balancing af advantages and disadvantages; this would be a disadvantage, but my plan would be abuse of the meney by the farmers. prevent the abuse of the money by the farmers.
- 03. Q. When did your wells begin to dry un?—Thoy have failed very appreciably within the last 12 months; thoy began to fall in 1900.
- 94. Q. Mave you had a year of good rainfall since 1900 P-No.
  - 95. Q. What is your average ?-25 inches.
- 90. Q. Havo you erer knawn wells so close together that they exhausted the subsoil water in ordinary yours?-
- 97. Q. Supposing you had money to make welle in a suitable tract, what would you as the nearest they should be to one another, so as not to interfere with one another? -I have no deta ta enable me to say.
- BS. Q. You cay, "There are analytic wells that I know of that are said to water 20 or 25 acres, but a great part of this land is in justified and wheat." Does it not pay the owner of a well to irrigate larger arese in that way than

Revd. H. Fairbank.

smaller quantities of engarcane?—That regulates itself; you will find very little engarcane naw; all the water gres to juari.

- 99. Q. It is ovident that it is n greater protection against famine; if we could get welle used in that way to irrigate large areas of juars and whent instead of small areas of sugarcane, that would be an advantage?—Yes.
- 100. Q. What do you think will happen, will they click to that or return to the smaller produce outgreams?—I think they will go back; sugarcane is a very profitable crop.
- 101. Q Aliwhat rate can an ordinary man berrow money to make a well?—The rates are exerbitunt; it dopends un the occurity.
  - 102. Q. A fairly solvent man, I mean ?-24 per cont.
- 103. Q. Do you think that the 5 per cent, that Government charges over prevente a man from making n well, who would make it if he could get it for less?—No.
- 104. Q. Why do you propose to reduce the rates?—In this way; that Government gets great benefit from that well in the value of the produce raised.
- 105 Q. Government, you think, could afford to be generous?-Yes.
- 108. Q. Still that would not increase the number of wells P-No.
- 107. Q. Would you extend the period of repayment of leans in ordinary years? Is the period too chart?—I have not looked into that, but I dun't think the period of 10 years is too short.
- 108 Q. Do you think they will begin to recover the ndvances too soon!—Since the heavy takevi loans have been given, there has been stead, famine, and things have been very hard; I would like to see a few good years before I could say yes or no to that.
- 10? Q. You said there was a case you know us a man who had made two wells and was now degging a third. Would it not have been possible in this case to have helped him with buring apparatus, to have made a trial boring in order to see what stratum cases of below and what were the possibilities of water?—There are many wells in seeks, and there are streams that you might just miss. I have never som it tried.
  - 110 Q. Po you think it might be usefulf-Yes.
- 111. Q. Did the man you spoke of come to any water in the first two wells f-Nothing worth while.
- 112. Q. And us regulds the third well?-He drives his sect till 10 o'clock.
  - 113. Q. How far Is it from the others ?-A mile.
- 114 Q. (Mr Muir-Maclenzie.) How much did these diggings cost him?—About Rs. 700 each.

- 115. Q. (Mr. Rajaratna Mudaliyar.) Is there any impression among the people that there will be on enhancement of assessment if they sink wells?—I have never heard if it.
- 110. Q. You were permitted to construct a private bandhara at your usen expense?—My uncle, Dr. Ballantino, did thut.
- 117. Q. On what terms?—He did not usk for permission; it is on his own lands.
- 118. Q. There has been no enhancement of assessment?—Not yet.
- [Mr. Muir-Mackonzle remarked that, if it was on his uwn land, there would be no enhancement.]
- 119. Q. The whole of that is his own land?—The extenment is his own, a part of it of the top might not be; it is like u that on the side of a hill; it is not n stream; this year the bindhara has not filled up, and there is no flow from it, but there is an old well underneath it which has filled and which was not full before.
- 120. Q. (Mr. Muir-Mackenzie.) Would you ndvocate the multiplication of that throughout the country?—The country is not steep enough for that.
  - 121. Q. Terrneing is a good thing?-Excellent.
- 122. Q. As a protective measure in time of drought?—It does not seeme very much with us.
- 123. Q. Would you be disposed to apply to Government to give you taker to distribute in your mission?—The difficulty would be the collection.
- 124. Q The Revenue Establishment might collect it?— We would rather the Revenue officers looked after it.
- 125. Q Why?-Because I should distrust my judgment. I should be nfraid of being a little too soft-hearted.
- 120 Q. If you lind the responsibility?—That is true, but there is the danger I mention because we have personal dealings with the people.
- 127. Q. I don't mean you should advance it to all the people, but only to your own?—The trouble would be that it would overwhelm us with work; we evild not nudertake it; my father tried the work of consiliation, and found it too much.
- 128. Q. Do you think it would be a good thing for Government to construct wells in the rayate' lacds?—I don't see why it should not if Government can get a trust-worthy staff to do it.
- 129. Q The rayate would not object, would they f-I doo't think so.
- 130 Q. Would it be more costly, do you think !-- I pre-ume it would cost more.
- 131. Q. How much more?—It would cost at least 10 per cent more; still I don't know why it should cost so much, because it would be given by contract; the only leveble would be that there would be a sticking on the way with the underlings; the supervision would be expensive.

Wirness No. 64.-Mn. L. M. Bose, Executive Engineer, Ahmelneger District.

Answers to printed questions.

Mr. L. M. Bosc. 19 Dec. 01.

Gross area under
command of
Government
Irrigation works.

Ahmeduagar . 4,214,478 acres . C9,780 acres. Khandesh . . . . . . . . . . . . 57,414 acres.

The actual area irrigated by Government works has

seres 9,400 in Ahmedingar District (1903-1901), acres 9,741 in Khandesh District (1826-97), both years of draught. Cause—rancily of water. In addition to the above, there are 163 uid second class landbares in Ahmednagar supposed to irrigate 5,100 acres of culturoble land in the talukm of Akola, Shrigonda, Nagar Parner, Karjat, and Kapargaon. With the exception of two, they are all temporary earthen bunds from each every sear) across small early-dry streams, and sinted 1877 the irrigation under them has been almost nil, owing to the streams belong dry. In Khandesh the bandbaras are mostly of massary across the large tributation of the Tupli; the area irrigated from them is 22,150 acros. The works are important, and are repaired and isoproved by Government from time to time. Latterly there has been scarcity of water-supply, and the arca has decreased. In Khandesh there is a large number of small village tanks that used to irrigate o few across of land under them, and were also used for watering cattle, etc., but most of them have either silted up or fallen into disrepair. In Nagar there are very few such tanks. Of well irrigation 1

oan only quote the following figures for a few telukas in Khandesh District:—

		,			Pakka wells.	Kaoheha walls.	Aren irrigated.	
Dhulin Molegaon Taioda Shahada Sinkhada Amalner Sayda Chalisgaon	• • • • • •	•			1,275 1,076 30 233 978 1,405 2,700 1,182	59 - 290 10 80 115 	8,008 2,364 83 409 2,056 6,176 2,485 1,905	

# Well irrigation in Nagar district is computatively small.

Well irrigation in Nagar district is computatively small.

Character of the soil.—The chief soils for oultivation are: Black (Kali), Tambat (Red), Barad and Paudheri (White), and in parts of Khardosh Bharki (white and salty). The sub-divisions are numerous and vary in different parts. Black soil is of two kinds, one known as black "cotton soil," a deep moisture-holding rich soil which yields a good crop of cotton, wheat and grain in average years of rainfall. Most of the eastern portions of Khandosh abound in cotton soil. The other is of a sticky and clayey nature, does not hold so much wnter, and is not so favoumble for rabi crops without artificial watering. Pandhari and Tambat, although naturally poor and yielding coarser grain, such as bajri, juari and till, will, with plonty of manure and water, bear heavy regetable and sugarcane crops. Bhurki soil with plenty of rainfall will yield good cotton orops. In a resting private private private and Mosam Valleys, the agriculture has been greatly dependent on bandhara irrigation from pre-Eritish period, and rice and sugarcane are extensively grown. Ordinarily, i.e., if the rainfall is average and timely water is not asked for monsoon dry-crops, such as bajri, till and juari (coarser kind), during the southwest monsoon. Orly fruit-trees and rich irrigated crops such as sugarcane, kamed (superior rice), plantain, pan, venetables, etc., that require artificial watering during the west monsoon. Only finit-trees and rich irrigated crops such as argareane, kamed (superfor rice), plantain, pan, regetables, etc., that require artificial watering during the monsoon as the rain in the Decean is not continuous, except on the Byhadri range. When there is a long break (usually in Angust or September), people become anxions, and then ask for water for monsoon dry crops. Sometimes the rain is heavy in the beginning, and the sowings are late, and these require artificial watering for bringing the crops to naturity. The following table gives the crops grown and the waterings required:—

TABLE I.

Name o Crop.		Nainro (classifica tion).		Number of Waterings required.	Time of year.	Remarks.

Distribution is controlled by the canal establishment on first class work. For every ten miles of canal and distributary (e.g., Jamda Canals in Khandosh) there is a Canal Inspector or Karkun, and nader him, 1 Patkari nud 1 Chaukidar for every four miles of main canal. The last wentioned watches the canal and maintains it and opens the sluices, and the Patkari distributes the water from tail to head of distributers le appropriately. the sluces, and the Patkuri distributes the water from tail to head of distributery in proper rotation. One measurer can measure about 1,000 acres. The revenue for all first class works is derived from direct crop rates. In second class works the area under the "channel" is permanently assessed as Bagayot, which includes water share and land assessment and are collected by the Revenue Department. In Khandesh these lands are called "Thals" sub-divided into "Phads" for practising rotation of crops (usually triennial and in a few cases quadrennial and quinquennial). They are all controlled and very occurrently managed by the irrigators of a village as a body, who have ancient and hereditary rights in the administration too lengthy to montion here.

# Paragraph III.

I believe no tank has been constructed in the Bombay Providency, with a high earthen dam cored with masonry walt. Black soil absorbs more water than others at first, wall. Black soil absorbs more water than others at first, but when once thereagily soaked, it is fairly water-tight. I have personal experience of only two irrigation works in black collon soil country, riz., the Jamda Canals and Mhaswa Tank in East Khandesh. The people grow chiefly cotton, which is very paying, with little trouble, and does not require any artitional watering in yours of average rainfall. Only in years of prolonged drought they use canal water (late in the scisson as a role) to bring the mossom crops to maturity. The annexed Tables II and III will show how the irrigation fluctuates in good and had years and also the protective value of the works and how the canal water is keenly resorted to in years of drought, such as 1900-1901. There is very little poreunial irrigathe canni water is keenly reserted to an years of drought, such as 1900-1901. There is very little perennial irrigation under these works, partly because the people are not very rich, and they do not like to risk capital for high class irrigation, but prefer growing oction. But latterly, I think, they have come to know the value of irrigation works and are keen about it, and they are likely to go in more in future for irrigated crops if water is could be. In paracettan growing parts, however, such as to go in more in future for irrigated crops if water is available. In non-cetten growing parts, however, such as Pimpalner Taluke, Upper Girms and Mosam Valleys, where the people have been practising high class irrigation from time immemorial from ancertain bandlaras, the owners of black soil lands are very anxlous for storage tanks, and these works are very desirable and are likely to be more remunerative than in cotton-growing tracts such as East Khandesh. Ahmednegar is not a cotton-growing district and here high class irrigation is likely to downsh and is desirable. Although perennlal irrigation under the existing works is very limited, but that is chiefly for want of sufficient water-supply. The people are very desirans of storage works and in binck soil high class irrigation is likely to flourish. likely to flourish.

Mr. L. M. Bose. 19 Dec. 01.

Paragraph IV.

The existing irrigation works in Nagnr District are:-

- 1. Bhatedi Tank and Canal.
- 2. Ojbar Left Bank Canal.
- 3. Likh Canal.

No. I is a storage tank of a capacity of 160 million cable feet (much silted up lately). It generally fills as a rule, and only four times since its construction the replenishment was short by about 20 per cent. The Irrigation has varied from 750 acres to a maximum of 1,720 acres during the last twenty years. On the whole the work has been fairly successful and the silt clearance is the only representation of 1,720 acres during the last twenty years. improvement de-trable.

Mos. 2 and 3 are fed by the natural perennial discharge of the Prayara River. The irrigation under the Ojhar Cauni has varied from 1,100 acres to 7,380 and that on the Lakh from 160 acres to 1,674 acres during the last ten years. The river supply is never equal to the demand, and in the case of the Lakh Canal especially, in bud years it runs dry about the end of February. The Ojhar is a

little beller off, but the supply being nucertain, high class irrigation does not prosper, the perenuial area varying from 145 to 265 acres. The people on this meanut do not venture to go in largely for high class irrigation under either works and they only take water, when available, for light crops such "rahi" and "monecon dry," but chiefy depend on the rainfall.

Particular recarding completed and proposed works as

Particulars regardle g completed and proposed works as per necessardum of Inspector-General of Irrigation are with the Supermeeding Engineer on special duty.

Resides the above existing works, storage necessis and canals have been proposed on the Mul's and Seens, the former when fully extended is likely to pintest about 3000 square miles of culturable land. There is also the Bolareri River project for irrigating Ropargaen and north of Sevara talakas. The details are with the Executive Logineer, Nack district. The above practically deals with all the important streams in Nayar district.

with all the important streams in Nagar district.

In Khandesh there has very large scope for extension of brigation. It is possible and is very designable to constituct a storage tank in such and every one of the great tributaries and sub-tributaries of the Tapti especially these under which handham irrigation is practised in a large scale, e.g., Penjiter, Kan, Atusum, Girna, Buri, Burni, etc. Latterly a great many of these have been prospected and proposals made for storage tanks and counis, the detailed information of which has been collected by the staff of the Sup-rintending Engineer on special duty and it is unnecessary for me to mention them here.

Paragraph V.

All irrigation works in Nagar district (and also in Khandeel) are "Imperial." I think it would be desirable that the Provincial Government should undertake the responsibility of the "Protective works," as it will give them a free scope to deal with such questions, and a neh works will be a great been to the province as recent experience has provincial Contracts," and um therefore unable to as more on this pant. to say more on this print.

Paragraph TIII.

I do not know of any tract in Nagar and Khandesh districts where the land or comps have been injured by excess of water and unter-logging. This is practically impossible, as the water-supply is by no means excessive and the people have to be given water by rotation as a rule. rule.

Mr. L. M.

Bose.

19 Dec. 01.

The following Irrigation works in Nagar District were left uncompleted, and it is very desirable that they should be speedily finished as "Protective works Imperial":—

1. Visapur Tank (still in progress);
2. Maladevi Tank (work earlod out by Executive Eogineer, Nasik district);
3. Ojhar Right Bank Canal; and
4. Musslandi Tank (in progress).

No. 2 will introduce irrigation in Shrlgonda Taluka, which always suffers from drought. In the beginning, the work will probably only jost pay its warking expenses but later on irrigation is expected to develop and the work may pay as much as 2 per coat, on direct capital, but he indirect profit will be very great, as it will protect about 50 square miles of Shrigooda taluka from famine in had rears.

about 50 square miles of Shrigooda inluka from famine in bad years.

Aos. 2 to A.—In conjunction with the existing Iakh and Ojhar Left Bank Canal from the Pravara River Irrigation schome. Tho existing two works being dependent only on the river discharge, invariably run short of water and consequently high class irrigation canaot prosper as already described in paragraph 4. The storage tank will be a great stimolos to the existing irrigation which will develop rapidly and moreover fresh areas will be brought under the new works. It is anticipated that about 200 square unless of the Pravara valley will be protected from famine and the works will be a great boon to the people and is likely to bring in some profit to Government after paying working expenses.

There have been no village tanks or other Irrigation works completed during the recent famine in Negar district.

district.

# Paragraph XIII.

Scale of water rates in Nagar District are :-

7/24
8 to 12
4
2 to 3
0.8.0 to 1.0.0
4

In Khandesh the rate	es are	:-			Rs.
Perenuial from			•	. 10	) to 16
Eight months	٠,	•	•	. 4	to 8
Four ,	·	•		. :	2 to 5
Monsoon dry					1 to 2
Special hot weat	ber				4 to 8

In all first class works water applications are received once n year for perenulal and by season for the other The distribution is controlled by the Cacai Establishmoat as described in paragraph 2.

Lines 4 and 5 answered in paragraph 5.

The attached Table VI gives the balance of tank water at the ead of irrigation season (31st March) for the Bhatodi Tank in Ahmednagar district from 1897-1901 and for n few typical years for three tanks in Khandesh district. In ordinary years, if the tank fills, there is generally a balance at the end of the year. The only other sources of rerenne besides water rates consist of realization from sales of babul wood, thoms, hemp plant, grass, and also rent from leasing dry portions of tank bed, but these constitute small proportion of the revenue. The charges of maintenance and establishment in irrigation works in the Decem are certainly not fair. They are often out of all proportion to the revenue realised, e.g., Lakh Canal in Nagur district. The revenus in the year 1897-98 was Rs. 1,400 and the Establishment charges were 29,055 and area irrigated 950 acres. The revenue accomits of these works are therefore by no means indicative of the netual financial results of the work. They are practically celipsed by the exceevively heavy Civil Felablishment charges, as the areas irrigated are comparatively small. TABLE VI.

Balance in Tank at the end of Irrigating Season. (In million cubic feet.)

		Nagar District.	Bhatodi Tank	Khandesh.		Mbarra Tank		Makti Tank		Persul Tank .

Mr. L. M. Bose. 19 Dec. 01.

Paragraph XIV.

The protective value of irrigation works in the Deccan has been immense since the year 1807. From the following table of works in Nagar district and the Jamda Canals (a typical work in Khandesh) will show that the canal water was fully utilized for irrigating crops:—

	Ojhar Canal.	Lakh Canal.	Bhatodi Tank.	Jamda Canal (Khandesh).
1896-97 1897-98 1898-99 1899-1800 1900-1901	Acres. 4,890 6,068 5,472 3,701 7,980	Acres. 1,614 950 970 1,058 982	Acres. 1,386 1,400 713 670 1,300	Aeres. 4,980 3,016 2,586 4,545

During the famines of 1696-97 and 1899-1900, the works of flood embankment and silt clearance were opened as relief works on the Jamda Canals in Khandesh, but the workers chiefly came from the neighbouring villages and only a handful of the labouring classes came from the irrigation villages and none of the agricultural class came from the latter places. The Kambis of these protected villages managed to raise a crop anyhow and had enough to live on, whereas the neighbouring villages were starving. Similarly on the Bhatedi silt clearance work in Nagar district in 1898, the irrigation villages sent only about 10 per cent. of the population compared to a neighbouring " dry " villago which sent 25 per cent. of its population to the relief work.

# . ]].

# A .- GENERAL.

- 1. Ahmedaagar and Khandesh Districts. I was in Khandesh for about 5 years at first a Assistant Engineer and latterly as Executive Engineer for Irrigation. In Nagar I have been for the last four months. I was also under the Superintending Engineer on special duty for two months.
  - 2. List of rainfall :-

List of average vainfall month by month on Irrigation Works in Almednagar District.

Mor	ithe.	Bhatodi (Ehatodi Tank). Averago of 21 years,	Ashni (Ojhir Canal). Average of 21 years.	Malunja (Irikh Cansll, Average of Bl years.
January February Alarch April Alny Juno July August September October November December	•	0 0 17 0 12 0 18 0 40 0 50 3 54 3 54 5 57 6 57 2 70 0 70 2 70 2	0-14 0-50 0-07 0-19 0-19 1-78 2-51 2-51 6-58 8-19 0-10	0-42 0 12 0 0 0 0 13 0 01 4 05 8 10 8 18 6 72 2 01 0 50 0 32

- 3. (1) There is no obstacle to extension of irrigation in either district, for "sparsity of population."
- (2) In irreated areas, the supply of eatile is generally sofficient, but during the recent famines the mortality of eatile has been heavy and is therefore likely to affect for some time the new tracts where irrigation projects are proreed.
- (3) The supply of mannro was noticed to be insufficient under the James Canals in East Khandish. In Negar district, the irrigation villages have sufficient manure.
- (4) No unsuitable soil in Nagar district. In East Khardesh the soil is mostly black collon, the result leing that the irrigation does not floarish so well under the Jamda Canals and Mhaswa Tank.
- (6) Uncertainty of supply of water and its too early constition have been the chief obstacles for extension of irrigation in both the districts.
- (6) Under the Jamda Canals and the Ojhar Left Pank Canal, lack of capital has been to a certain extent the cause of non-development of high class irrigation.
- 6. I know of no instance where cultivation in Jirayat land has been deserted for irrigation tracts. I have noticed the people everywhere very anxious to have water-upply increased and ensured in order that they extend irrigation. I have noticed this particularly in Pimpaluer taluka and Girca and Mosain valleys, where the agriculture is chiefly dependent on old irrigation channels and bandharas.

# B .- CANALS OF CONTINUOUS PLOW.

- 7. (1) Two crops and sometimes three rrops are grown in one year if there is sufficient water and manure
- (2) Yes. More unlumble crops are grown if the people are keen and have enough capital and manuro and water.
- (S) (a) and (b) Yes. (c) If the water supply is ample.
- (3) (a) and (b) Yes. (c) If the water supply is ample.

  O In all first class counts in the two districts, weter rates are charged on the actual area irrivated, and the owner of the land is the person who is responsible for the payment of assement to Government. In Khandesh nuder the second class works a consolidated rate is settled by the Revenue Survey Department which includes the lands assessment as well as the water rate for the whole area under command of the channel known as the "Tual," irrespective of the area netually irrighted. In Nagar there are no account class channels of continuous flow.

  The area was classed on the Other and Lach Canals.

The average erop tate on the Ojhar and Lakh Canals (Magar District) is Rt. 3-12 Oper nere.

In Khandesh on the Janda Canals the average rate is Rs. 5-6 5 per acro. All thee first class works.

The "Thel" rate for second class works vary from Rs. 2 to Rs. 15 in Khandesh. to Re 15 in Rhandesh.

- 10. It generally easts the irrigators about Rs. 2 to Rs. 5 for making channels from the "distributary" or "canal" for bringing water into his field. This is generally borne by the owner of the land.
- 11. The evils mentioned in the three lines do not exist on any of the works that I have come across. Rotation system is generally adopted, which prevents waste of water and water-logging.
- 20. In first class works the maintenance charges including small repairs, slit charance, the, are rarried out by Government and the rharges vary from Rs. 2 to Rs 3 per acre. In second class works the villagers generally do it, nullest owing to chromostances beyind their control such as exceptional finels, etc., the work is two costly or difficult for them to carry out and in such rases Government carry out the work from "Imperial Fands." This system is not very satisfactory. In several justimes villagers have neglected the channels and let sitt accumulate and then they apply to Government for doing this work as being "legond their power to do." I think same legislation is necessary, to define the responsibilities of the villagers on recond rhase works. Certain rules have recently been framed by the Commissioner, Central Division, but they have never been observed. Legislation is necessary. 20. In first class works the maintenance charges includ-

# D .- Tines.

- 23. (1) All the tanks in Nagar and Khandesh districts are supplied by the annual rainfull on their catchments.
- (2) By n direct renal from the tank in the case of Bintodi (Negar) and Mhaswa (Kindesh). The Mukty and Parenl tanks in Khandesh feel old second clars band laras from which water is delivered to the lands by ' channels
  - (3) The supply is maintained in all the above cases-
    - (a) Throughout the year.
    - (b) About 9 months.
    - (c) Up to December or January.

Rose.

19 Dec. 01.

- 24. (1) Too late replenishment generally affects sowing of mensoon and eight months crops; the balance that is neually left from provious year is generally utilized economically for percential crops, and cannot be epared for other
- (2) Too early cessation affects the porennial oreps especially and unless well water is used they are liable to perish. As a rale, however, all fields with perennial crops have got wells.
- 26. Not in ordinory years. Esoh perennial field as a rulo has a well (in Nagar no application is granted for perennial, unless there is a well in the field). In bad years well water has to supplement the sanal water, especially for high class crops, and only half the usual rate is charged in such cases.
- 28. Bhatodi Tank (Nagar) avorago rato Rs. 4-12-9 por acre actually irrigated.
- In Khandesh average of four tanks is Rs. 5-5-9 per acre per area actually irrigated.

Under Mukit tank in Khandesh (Lower Panira River works) a double system provails. The "Thal" areas under the command of the second class channels that existed before the construction of the tank are still charged con-solidated "Thal rate" irrespective of area irrigated (rate averaging from Rs. 10 to Rs. 13). The fresh lands besides the above that received tonk water are charged first closs crop rates.

- . 29. Samo as paragraph 10.
- 30. By Government, except on the Lower Panjra worke, whore the villagers look after the channels. Same remark as in Question 20. Legislation is especially desirable for such works as recently (in 1899). There was a good deal of trouble about the distribution of water between Thol and "Jirayet lands,"
- 33. The Bhatodi Tank slomgo hos been considerably 33. The Bhatodi Tank slorage has been considerably reduced (by obent 50 per cent.) since its construction (30 years ago), owing to accommulation of silt. The quantity of ellt accumulated in these years is about 73.4 million cubic feet, i.e., at the rate of 3.44 million cubic feet per year, from a catchment of 44 square miles. No dredging has been reserted to. The work of removing silt by excaration was done as a relief work in the year 1898-99 in the hot weather, when the tank was empty.

# E.-WELLS.

- 34. (1) The depth of permanent wello varies from 20 to as much as 60 feet. The water surface varies from 13
- 1. Q. (The President)-The district you know best is Khandesh !-- Yes.
- 2. Q. You were there for 5 years?—About that; I was there from 1896. Before 1896, I was at Ahmedingar for 3 years os Assistant Engineer.
- 3. Q. You say there is no soil in the Ahmednagar district nashitable for irrigation. Do the people irrigate all kinds of soil?—I think so; especially in Ahmednogar. The black soil there is not of the same kind as in the East Khaudesh which is deep black cotton soil. In the Ahmed-nagar district the black soil is not so deep, has more clay in it and is suitable for the irrigation of high class crops.
- 4. Q. Have you known cases of irrigation of rabi crops in Khandesh ?-Yee; I have seen wheat and gram irrigated under the Jamda canals.
- 5. Q. How long does the canal keep running?-In Fobruary the canal was quite dry.
- 6. Q. Wheat is sown under this canal?—In 1899 they went in largely for bajri and cetton oreps.
- 7. Q. When is bajri matured ?—In September,
- 8. Q. Is that a kharif crop ?-Yes.
- 0. Q. When is the rabi crop sown ?-In December and January.
- 10. Q. The canals, which run full up to December, give 10. (2. The cannis, which run tull up to December, give quite sofficient water for the rabi crop?—Yes; as a rule. Yery large areas were irrigated in 1896. That was about the maximum under the Jamda cannis. 1896 was not a bad year, although there was distress; we had splendid rain in the beginning of the season. In the year 1899 the case was quite different. The rainfall was deficient,
- 11. Q. I notice that in 1809-1900, 4,615 neres were irrigated under the James canals?—Yes; that was a very entisfactory area compared with other years.

- to 30 feet from ground level, and depth of water from Mr. L. M. 5 to 13 feet.
- (2) Generolly from enb-soil percolation, especially those in irrigated trace and below tanks. In the hilly parts wells are generally fed by oprings.
- . . (a) They do not fail in ordinary years as a rule.
- (b) Generally fail; especially those fed by springs.
- (3) Pakka wells coat from Rs. 150 to Rs. 600; Koeliolia wells from Rs. 75 to Rs. 100.
- (5) Water is usually raised by "Mote" or leather bags drawn by one or two pairs of bullocks. The number of "Mots" vary from 1 to 4 according to the size of the well.
- (7) The average area irrigated by a well varies from 2 to 8 acres in one year.
  - 35. (1) Yes, partly.
- (2) Generally vegetables, chillico, enions, sweet-pointees, etc. Sugarcaue is raiely grown from wells.
  - (3) (a) Yes.
- (b) They generally grow food-grain and fodder in bad years. Sweet-polatoes were very lergely grown during the last famine in Khandesh as they afforded good nourishment to the famished.
- 38. In Nagar district recently some experiments were mode with boring apparatus with success. I think this should be encouraged, and it would be advisable for Government or local bodies to invest in a number of boring tools and let them out on hire to cultivalors, at reasonable rates, and also professional assistance should be given where readed where needed.
- 39. Government cannot very well undortake to construct wells in priente lands, but they might assist by giving professional advice and supervision free of charge and also by giving tagai advances and seeing that they are made praper use of.
- 40. Kachcha wells are commonly resorted to in years of drought but unless they are dug in places where water is expected to be met with, such as in tracts below some tank or canal, or near banks of attenues, they are invariably unsuccessful. In 1890, in Khandesh, these wells hold water only for short time, and as the season advanced 50 per cent. of them dried up.
- 12. Q. Was the canal dry in December ?- It was not quite dry, but it was not working at anything like its full copacity.
- 13. Q. You have a tank and two canals in your district. Have they their own catchment basins?—Yes.
- 14. Q. From local minfall?-The Bhatodi in Ahmednagar and the Mhaswa in Khandceh are fed from their own ontchments by streams m the ghats.
- 15. Q. What is the Multi P—It is a tank fed by its own catchment. It feeds a number of bandharas below.
  - 16. Q. No canal feeds it ?-No.
- 17. Q. Is it n tail tank !- We have no tail tank in Khandesh at present.
- 16. Q. Throughout Khandesh is there a great number of old village tanks?—There is a large number in the Nasik portion of the Irrigation charge.
  - 10. Q. None in Ahmeduagar P-Very fow.
- 20. Q. Are the tanks in Khandesh and Nasik generally in good order?—Most of them have just been repaired. During the fleeds of 1877 and 1896 a great number of the bunds burst. I know one bund particularly near Dhalia that burst in 1896.
- 21. Q. (Mr. Ibbetson)-In 1896 ?-Yos; in the last
- 22. Q. (The President)—Do the people show any desire to have these bunds repaired !—Yes.
- 23. Q. Do they never do that themselves !- No; the work is too heavy and too expensive for them.
- 24. Q. De the Public Works Department de anything ? -No; the Irrigation Department generally repair them.
- 25. Q. Havo yen been employed in ropairing any ?-Yos, I sent up estimates for the Bhokar Tauk which was going to

Mr. L. M. be takeo up as famine work, but sanction did not come in Bose. time, and it was not taken up.

19 Dec. 01. No.

- 26. Q. Was the Parnaphra tank substituted for it?
- 27. Q. Is that u local tank?-No; it is u very big irrigation tank.
- 28. Q Aport from famino relief does the Poblic Works Department not repair these tanks from time to time?—Yes, the Public Works Department repair certain taoks, but the people have to make a 10 per cout. centribu-
- 29. Q. Thoy apply to the District Eogineer?—No; to the Irrigation Eogineer. A reference is made to the Revenue authorities as to whether it is worth while doing the repairs, whether there would be only appropriately increase of irrigation, and also whether the rayats are willing to pay assessment in case the tank is repaired. Generally a consolidated rate is charged. solidated rate is charged.
- SO. Q Are there any places where there are chains of tanks following each other down the same streom?—No; we have proposed one on the Panjra, but it has not been
- 31. Q. Are the people keen on irrigation in ordinary times and do they make applications for irrigation works, or do they only want irrigation is those of drought?—In East Khundesh they are not very keen.
- Khundesh they are not very keen.

  32. Q. In the east I suppose cotton grows easily without irrigation?—Yes, cotton grows very easily; it requires very fittle trenble end expense; and so they go in largely for cottoe. The case is quite different in Ceotral Khandesh and in the west along the upper valley of the Punjra. North of the Tapti the people like irrigation. A chaonet in the Shahada taloke was repulred during the year 1896-97, which irrigated, I think, something like 500 or 1,000 acres. Similar chaunels might be made north of the Tapti where the people don't grow so omeh cotton. They go in more for rabi, wheat and gram. I have also noticed that the streams corth of the Tapti, near the foot of the Satparas, are mostly perennial.

  33. Q. Is the rainfull along the right hank of the Tapti
- 33. Q. Is the rainfull along the right bank of the Tapli heavier throughout Khandesh generally ?—The Satputas get n very good rainfall.
- 34 Q. Do you think favourably of thom ?-I think Karrand is a very good tank; it will not be so expensive as the Amner tank, which is very costly. I doubt whether it will pay, as Governmeent will have to invest a large omount of capital lo it.
- 35. Q. Do yoo thick the lond below the Kaivand tack will take irrigotion?-Yes.
- 36. Q. Whot other tanks you have been engaged upon ?-Chankapur, Merkundi aed others.
- 37. Q. Which of these do you think the best?—The Chankapur tank is the best, because it will be a predactive work. People in the upper reaches of the Girna have been used to irrigation from time immemorial, but latterly owing to the destruction of forests the river sappty has become very poor-
- 39. Q. The catchment basin is 100 square miles?-Yes.
- 39. Q. (Mr. Muir-Mackenzie)—Hus the destruction of forests taken place recently ?—Not io my time; it was done 50 or 60 years ago. The villagers in the npper receives of the Girms used to practice irrigation from old channels, but now they have discountined doing so because the water anpply is not sufficient, which shows that the river supply was sufficient at one time, but it is not so now.
- 40. Q What time do you refer to?-About the last 30
- or 40 years
  41. Q. Do cultivators say that f-Yes.
- 42. Q. Do they attribute it to the destruction of the forests?—They say that they cannot tell what the real rause is; but that might be one of the reasons.
- 43. Q. (The President)—When you refer to the system of repsire of second class works, you mean bandharas?
- 44. Q. You eay "in several instances villagers have 41. Q. Ion eay "in several instances valugers have reglected the choncels and lot silt accumulate and thea they apply to Government for deing this work as being beyond their power to do." What are these chonnels? Whot would you like to do?—I was referring specially to the Mukti tank, where I had trouble in 1900. The land is partly under n kind of bagayet and partly under the crop system. The water io the tank was very little; not evon one-third, and we had to introduce a system of

- rotatioo, but the villagers began to intercept water in the upper reaches and we could not control them.
- upper reaches and we could not control them.

  45. Q. I suppose you were working in conjunction with the Collector?—Yes; I refer to certoic instronces in which I came upon villagers who intercepted the water and wasted it: I called the Collector's attention to it and proposed a penal rate, but he said we could not interfere in cases in which permonent bagayet was paid. I recommoded that the offenders should be prosecuted for mitchief. Some sort of legislation is, I think, necessary to keep water more under the control of the Irrigation Department. I also thick legislation is necessary to make the people often the silt. Formorly contributions used to be made by the villagers, and the Irrigotion Department used to clear the silt from the channels. I thick Government ubdicted that system, hecans it was considered illegal. The villagers have to do the ordinary silt clearance, and when the channel is very much eilted ap nader cirsumstances beyond their control, such as from heavy floods, etc., the Irrigotice Department takes the work up. It is very difficult to define where the villagers' responsibility commences and where it cods.
- 46. Q. You coulend that it would be far better if the Irrigation Department did the thing always?—I think not, because it would east Government much more than it does at present. The villagers would be cure to neglect their channels. I think the Putfalla system was the best. It was preferable to the present one.
- 47. Q. (Mr. Ibbetsen) Do you know why it was abolished? The High Court, I believe, decided that it was nu illegal contribution.
- 43. Q. It could be made legal by passing a law?—Yes; I think it is very desirable that some sort of legislation should be passed.
- 49. Q. (Mr. Higham) You were in charge of the Purms" pado taok when it was being built as n famioo relief work?— Yes, I surveyed it, deeigaed it nad carried it out.
- 50 Q. When was the work stopped there?-About last January.
- 51. Q. What is the system ?- This tank is in place of one . that was originally proposed, higher up the river. I was put on drawing up the project in 1896.
- 52. Q. What is the state of the tack?—The side embankments are aearly completed. The gorge portion remains to be done as also the waste weir.
  - 53. Q. The dam is made of earth?-Yes, entirely.
- 51. Q. How many labourers were employed on it?-About 15,000.
- 55. Q What perceotage of work remains to be done?—I should think about occ-third has been done.
- 50. Q. How long were the 15,000 people employed on it?—About eight months; the work was started late; there was some coasiderable delay in getting staction.
- 57. Q. Do you know what famine expenditure was neutred?—I could not say exactly. I think it was a couple incurred?of lakhs.
- 53. Q. Could you not have employed more men on work than you did?-No.
- 59. Q. Sapposing you had had 15,000 ordinory inboarers on the work would you have finished the work?— I do not know whether we would be able to get so moch labour in ordinary years; about 10,000 labourers would be quite sofficient to finish it in one season.
- 60, Q. As a matter of fact you lad 15,000?—They were famine labourers; but they did a fair amount of
- 61. Q. What proportion does total payment to the labourers bear to the netual value of work done by them?-About 80 per cent. I do not know the exact figures.
- 62. Q. Have yoo seen the statement prepared by Mr. Beale ?-Yee.
- 63. Q. Do you accept them?—I think by making a part of the dam of masonry we could store u little more water. I think it is too late now; we could have made the right bank of masonry; I had proposed at first that we should store at least 100 millions cubic feet, but it was objected to.
- 61. Q. How could you store the water?-By putting untomatic gates they would have irrigated a larger urea
- 65. Q. Do you call Mr. Beale's estimate fair?—Yes, it is very foir.

- 06. Q. Did you make any estimates?—Yee; these are practically my figures.
  - 67. Q. No complete estimate has ever been submitted? -Luly a famino estimate.
  - 69. Q. What about the complete project?-I think Mr. Gallagan is proparing it.
- 69. Q. You did not prepare one P-No.
  - 70. Q. The only estimate you prepared was an estimate for relief works?—Yes.
- 71. Q. If the tank is made, it will supply a number of bandharas below it?—No, only two.
  - 72. Q. Is there room for the extension of in igation? There is plenty of scope for that.
  - 73. Q. Would you make now bandharas !- Two new canals are proposed.
  - 74. Q. The canals would be below the bandharas ?- The Landharas are below the capals.
  - 75. Q. You have to pass water down to the bandharas? -Yes.
  - 76. Q. You would have no trouble?—No, there would be no trouble, because it will be a first class work.
  - 77. Q. There would be no necessity to impose a water the P-No, except for the fresh land that comes under irrigation.
  - 78. Q. Woold any fresh land be brought onder irrigation ?—Yes, I think so, especially below Amaluer, where the people are keen to irrigate. They are very well off.
  - 79. Q. You would extend Irrigation on bandharas ?-I think it would be more profunble to extend the present 'Amainer channel than to make a new canal.
  - SO. Q. A great portion of the soil in the Nasik district is not black soil?—No; about our-fourth is black soil.
  - 81. Q. The rest is red !- Red and white marnm.
  - 82. Q. What is the dopth of the red soil ?- About 5 to 6 feet.
    - 83. Q. It is not a rich seil ?-No.
- 84. Q. What crop can be grown on it?-Very good ground nuts.
  - 85. Q. What about sugarcane?-Black soil is very good for augarcano.
  - 86. Q. What about red soil?-With plenty of manure, sugorcane might be grown upon it.
- 87. Q. If you want sugarcane, you have to put down plenty of manure?—Yes.
  - 88. Q. For other crops?-No.
- 89. Q. (Mr. Muir Mackenzie.) Ground nuts ?-I don't think that erop requires much monure.
- 90. Q. For the bandharas you have to repair in Nasik and Khandesh, you take 10 per cent. from the people?-No; they don't have to contribute anything.
- 91. Q. You say sugarcase only requires watering for 15 days?—That is the maximum interval between weterings; it takes only 8 or 10 days ordinarily.
- 92. Q. The interval depends upon the depth of the soil f-
- 93. Q. If you give heary waterings, do they go further ? -- I think so.
- 91. Q. With regard to the distribution of the caunt supply in Nasik, does your establishment control the distributton inside the water-course as well so the Government canal?—No, not on second class works. Of first class works we shut up the shuices, which, however, the villagers can easily
- 95. Q. What is done on the Jamen canal !- That is a different work oltogether; there is no bandhara system
- 96. Q. You have the canal and the water-courses? -- Yes, and the distributaries.
- P7. Q. Do you control the supply of each watercourse !-- Yes.
  - 98. Q. You shut up one and open mother ?-Yes.
- 99. Q. Do you control the water ofter it leaves the watercourse?-No; the villagers distribute it among themselves.
- 100. Q. The canal establishment does not interfere?-No.
- 101. Q. How do you manage the tail of the noter-purce?—The fields at the tail mro generally given water course ?-

- 102. Q. Who gives them the water f-The Patkaris who look after them; the villagers, as a rule, agree among themselves about the distribution.
- 103. Q. Your experience of irrigation works generally is 19 Dec. 01. that the areas fall off in wet years?—Yee.
- 104. Q. In bad years you get very large areas !-Yes; epecially for moneous and rabi crops.
- 105. Q. The worse the rainfall, the larger the area irrigated  $\hat{r}$ —Yee.
- 108. Q. You do not irrigate more in a bad year new than you used to P—Latterly. I think, there has been a tendency to extend irrigation under canals in good years. The people are more keen than they used to be.
- 107. Q. Do you think the people have began to care less about fluctuations in the rainfall?—Yes; but there is one great drawback, that is the uncertainty of the river A storage tank for the Jamda canals would be a supply. great boon.
- 108. Q. Would they take water in a wet year?-Yee, I think they would go in for more sugurcane.
- 109. Q. (Mr. Rajaratna Mudaliyar. In Khandesh, you say there has been scarcity of weter-supply; has the area decreased to some extent?—I know in some villages the area is one-third of the original error. As a rule, I think, there is a decrease of 30 per cent. even in good years.
- 110. Q. That, I suppose, is due solely to the deficient minfall? Yes.
- 111. Q. Is there no deterioration under the channels?—In some cases the channels and bandharas are silted up. The chief munt is that of nusum storage reservoirs; on the Girna. Burrai, and Panjra valleys irrigation would have floarished copiously had there been plenty of water.
- 112. Q. You say, "In Khandosh there is a large number of small village tanks that used to irrigate a few acres of land." Have you ony idea of the extent of land irrigated?—I don't think it ever exceeds 5 acres.
- 113. Q. What is the total area irrigated ?-I have not got the figores.
- 114. Q. Can you think of any arrangement by which the system of application for cauni water could be dispensed with?—The only arrangement that could be made is to place the whole irrigable area under permanent bagayet like the land under second class bandharas. I suggested to Government a few yours ago to place at least a part of the area under the Inioda causis under permanent bagayet. That proposal was, however, not accepted chiefly on account of the short water-sapply.
- 115. Q. You say people have to wait a long time for replies to their applications?—I think a great deal of delay can be avoided if a Sab-Divisional Officer is empowered to grant water appropries Instead of the Executive
- 116. Q. Are you aware that in Sindh no application is required at all?—In Sindh there is a permanent assessment. We have not tried that in this Presidency. At present there is a let of delay in grantin, there applications which deters the cultivators from asking for water.
- 117. Q. (Mr. Muir-Mackenzie.) A Patel on the Jamda canals said that some onlivators owning about 250 nores of land had expressed their willingness to accept a permanent assessment. That is the Bahal village; I think it should not be introduced on the whole of the Jamda canal unless a concentration of the storage tank that is we can ensure a water-supply by the storage tank that is proposed.
- 118. Q. If the supply could be assured, do you think a permanent assessment would be acceptable to the people's -Yes.
- 119. Q. Would it be advantageous to the people?-Yes, there would be more inclination to extend the irrigation of high class crops so that they could get more profit.
- 120. Q. Are you owere that on the bandhara system is 129. (2. Are you owere that on the bandhard system to fixing permanent rate the precurioasness of supply is taken into consideration?—Not everywhere, I am afiaid. On the lower l'anja, where we have got a storage tank, the rate is fair enough, but on other works like the one near Thengoda they have got a very small Thal, and the assessment is Rs. 14, the water-supply being for from perennial. In unany cases the assessment is not fair.
- 121. Q. Do you mean that the enpaoity of the bandhara has been imperfectly calculated P—1 think that is so in many cases, but in some cases it is all right. As for example at Baro Rs. 15 per occe is charged, but they have a small perennial sapply, as it is just below the proposed Chankapur, tank; people have grown rich there exting to the rich quality of the soil.

Mr. L. M.

Mr. L. M. Bose. 19 Dec. 61.

- 121. Q. You would lower the rate on the Jamda?—I should recommend that it be lowered to Rs. 5 per acre.
  - 123. Q. You think that would allow for fluctuations? −Ye&
- 124. Q. (Mr. Rajaraina Mudnliyar) As regards the Visapur tank, I find that about Rs. 8,00,000 have niready been apent; what amount would be required to complete the work P—I could not say exactly; the estimated amount is Rs. 14,00,000. I do not know what the normal expenditure would be; about one-sixth of the embankment lasbeen done.
  - 125. Q. Five-sixths remains to be done?-Yes.
- 126. Q. Do you think that when the work is completed, the sapply wil, be sufficient to reach the waste weir :- Not erery year.
- 127. Q. In normal years ?- No. I think Mr. Beale has calculated that it will fill in 14 years out of every 27 years. I am certain it won't fill every year.
- 123. Q. You say that when the work is completed, it will irrigate an area of 50 s pare miles?—It won't irrigate 50 square miles; that is the area commanded; the area irrigated will be about 8, 00 serie.
- 129. Q. Only \$,000?—Yes, about that; in a bad year it might be a little more.
- 180. Q. (The President.) You say the laid submerged under tank is worth Re. 45 per acres Yes; the hard is not good; most of it is waste land.
- 131. Q In Ahmednagar there are only two second class only sure; they are looked after by the Public Works
- 102. Q. The average annual expenditure for the last ten-teurs on these is Rs. 2.440; the gross revenue Rs. 535. Can you explain why the expenditure is five times the press revenue?—The expenditure must have been incurred in putting the channels in order and rejairing the landharms; it is not a recurring expenditure; it is an initial expenditute
- 133. Q The amount shown under improvements is only an average of the past ten years !—Yes.
- 131 Q In your first note you say, "In bed yours well water has to supplement the cala, water especially for high class crops." Is that invariable the case?—Yes; in the Ahmednapar district to water application is ultimed for suprame or of er perenn'al crops, unless the country has a well in he will be a seen as the country. has a well in his fuld.
- 135. Q For what period do you supply canal water?— This year water non't last for inspect on another fortingle; the canal is a ready nearly empty.
- 136 Q For what period do they use nell mater?—It will be for more than half the period this year, to only half the assessment will be charged.
- 137. Q. Even supposing you have could water enough only to tast for a ferting it, what do you do f-We generally

- serve the perennial crops as much as we can in preference to other crops.
- 133 Q. Do you know anything about the Bhatodi tank? Yes.
- 139. Q. The average revenue is Rs. 4-12-9 per nere actually irrigated, and the working expenses exceed the revenue?—The working expenses include "establi-hment charges"; I do not know that really represents the actual cost of management.
- 140. Q. What proportion of establishment charges is inclined?—It is a very complicated and o'aborate system.
- 141. Q. The carabli-hment charges are out of all propertion to the revenue derived ?-Tes.
- 142. Q. (Mr. Higham.) Are there any provincial works in progress?—Very few.
- 143. Q. The establishment charges have nothing to do with them?—No, they are Local Fund works.
- 144 Q. Dn you charge to the Local Funds n certain percentage ?- Yes 12 per cent.
- 145. Q. The establishment charges are exaggerated figures?—Yes, always. In Khandesh the establishment charges are heavy because the number of works of the first class is very small. To charges ander the Januda Cand class is very small. Ho charges mader the Jumda Canni are very leavy, because the district has not got many first class irrigation works.
- 145. Q. Do the Jamila camble yield a good reroune!— Tes, but the number of high class works in progress is very small and the cetal lishment charges are consequently Arre.
- 147. Q. There is no debit for exhabitehment in regard to second class morks ?- No.
- 119. Q. It is debited to the first class works only ?- Yes. 14). Q There else grain Ahmedisgir are exceptionally high?-let.
- 150. Q What has pened in the case of a Provincial Divi-sion like chotas in f.—The clarics woold not be so heavy.
  - 151. Q. Only 23 per cent, would be charged ?- Yes.
- 162 Q. Trking all the Divisions together, it is too light in some districts and too low in others? I do not think it is too low anywhere
- 183. Q. (Mr. Meir-Markensie) In the last pamgraph of the fact that only n Landful of the labouring clause came on relief works from the rillings lirigated by cander—Yes; I neited that on the Jan d's canals.
- 154. Q. Wenl'it be fair to generalize from that that erers village which had an appreciable quantity of its measuringstet by a Government coral would send either none of its population or only a small proportion on relief works?—Yes One sillage in Planpher, in Khandesh, did not send a single person on relief works. In 1100 when we had a relief work on the Jamba caval for silk character, most of the beloud is come from the neighbouring villages and very for from the villages under the canals.

Applitional notes of witness of Ileication works in Knap of the District.

I hope it will not be considered presumption on my part I hope it will not be considered greenerphon on my part it intends on the valuatle time of the Commission, by senturing to make a few further remarks in recard to brigation works in Khan is shelter, which I unfortunately cuntted in my evidence before the Commission.

2.1 heg to attach a last of storage works in the district which have been investigated what the form time to time and the details of what which are given by Mr. hards in his report. I would divide them into three classes.

report. I would divide them into three classes:—

Coase A—I roductive works—Chunkapur Project is the only one that can be included in this. In the revenue forceast, Mr. Peste has assumed the proportion of crops the same as the last ten years aroung figures on the Lower Panjan works. I keep respectfully to point out that these latter works are situated in the content portion of Contral Khandesh, where cotton, the great enemy of irrigation, is extensively grown, whereas the scape of Chaokapur Project lies in the "Fagiam" that, where the prople, from time immercial, have been chiefly dependent on irrigation from the encient hambaras with recovious people, from time immersion, mare then once, appearance on irrigation from the ancient handhorse with precisions of meta-annile. Cotton is not crown here, and the "Phad," non strigation from the abetent complants with precisions are supply. Cotion is not grown here, and the "Phad," or squadrennial rotation system, is largely practiced in the irrigable lands, and generally as much as 50 per cent of the area ere deroted to supercase, rice, and other high class crops, (Bottom of page 5 of Mr. Pea'e's report.) For this

reason I ber to submit that under the proposed Girna Reft Lank Candland il e extension of existing Landfaras, the proportion of high class crops will be much higher than that on the existing Lower Panjra works, and thus the net return is likely to be more than druble the figure assumed by Mr. Ibale, vie., 15 per cent.; and I family believe the mork will prove to be a productive one. Of course, a productive work of this kind is bound to be "Protective" as well. Experience has shown that famines of the present time for not cross dearth of grain in the country, but want of mores, and couplourent to about that commodity. Systematic development of high elasy irrigation will meason much additional wealth to the tract, and the employment the working classes will find among these irrigated fields in times of famins will be a sufficient "protection," and will obviate the necessity of opening relief works by Government.

Class It—This consists of storage tanks for feeding the existing ancient "Landhams system." Owing to the light cost of the storage, there works are not likely to be directly "Productive." In the six valleys on which these tanks are proposed, three are at present 12,588 acres of permanently, assessed linguisting, under 97 ancient mesonry Landhards. The area used to be much larger over 50 years ago, and even in the recent survey actilement a me portion, has been converted into

"Jigget" (dry crop land), owing chiefly to the paucity of water-supply, which I have been told has been on the decrease, owing to the destruction of the forests in the hills. In 1899-1900 I had been personally over many of the villages, and observed, that most of the channe's censed to flow after December, and in others the discharge was very insignificant, and the loss to the irrigators, especially those that had no wells, was very great. I can quote one village (viz., Antapur in Raglan Taloka) where more than half the "that" had been lying fallow for soveral years, owing to sensity of water, and yet the people and been continuing to pay the full Bagayet assessment. I recommended remission of revenue in this case, and I hope they gat it. Henrissions were granted for several other irrigation villages, but I am afraid the number was small and the compensation was in no way sofficient for the less the people sustained. The people of these parts, unlike those of East Khandesh, are chiefly dependent on irrigation, and if the water-sapply is oneured by the above storage tanks, the irrigation will tapidly develop and the whole tract will be immune from famine in future, and there will be no necessity of remissions. In versa of drought, the emplayment, the laboring classes will find in the fields as mentioned in the previous tractions in the first in the first saving to Governower. These works are meant to introduce irrigation for Governoment.

Class C.—These works are meant to introduce irrigation.

Class C.—These works are meant to introduce irrigation in outliely fresh tracts, where it has rever been practical before, and the projects too are very coath, and in regard to Baigur Tunk there are professional difficulties. They will be very useful for concentration of large number of reliaf workers in times of fomine, and I would recommend these works to be only reserved as such. There is no doubt that in a year of drought the tunk water will be fully utilized for any crops, but in ordinary years I have very gut at doubt as to the development of huch class irrigation, especially under Reipur Tank—as cotton is the earlie 'crop in East Khandech. The Auer Tank being of a accury will abord very little work for relief purposes—and lesides, it is too costly to be tried as an addinary ynterize nork. Karunud Tank may be tried as and discovered has reliclarach cultivated here, but I may add the North Taght region, being close to the Satpidae, rarely schief foundrought. The case of the Munad Tank is unique. The Jamda can do are recent the error of works in Rast Khandech. They have not been funguially successful, but, as the people have bearnt the value of irrigation since their construction, there is no doubt that, if a storage tank channes the water-supply, which is the chief drawhach for. It ligation will extend and flourish, then hat a the same rate as in the case of the other weeks under Class B. The construction of this tank is strongly to commended as an ordinary protective work.

strongly recommended as an ordinary prote tive work.

3. The shore deals with all the important projects in Khandesh, but over and above this, there is a very large reope for smaller lanks of the Parsul type; throughout the district, in fact, one or two can be constructed in reach Talaka or Yetha for inmine relief purposes. I may mention, for example, supplementary tank on the Konoli it feed the Hori system, also similar one on the Puanud, Aram, Panjan, etc. Besides these, there is almost unimited charge with he more or less rained state, all of which already exist he more or less rained state, all of which can give heaple employment for relief purposes. There is also nother very useful form of relief work, that could be statted as text notes in the highming of a famine, rize, slit chanance of existing channels and landbarne. I had recommended this in April 1960, but the famine was too far advanced then, and large concentrated walks were needed. These test works can be undertaken in groups of four or two villages under the supervision of the Civil Department. The above programme is ample for the district and will obvide the necessity of breaking mountain heaps of ractal to waste, or opining roads that the local funds cannot afford to keep up.

1. I am not in favour of construction of acts bendhoras and absences generally, nuless the water-supply of the strong is perensial, or it can be replainfied by storage truks. They only sit up and cross trouble and disappointment. In Shahara and Islands talukas, at the foot of the Satpadas hills (which are full of done toosts and the rabifull is very brays), the etroms, even in lad years, have a perennial flow. I may make particular mention of the Shadada buildhara, and channel (5 miles long) on the Gomai, that has re-tored by famine labour in 1896. In the exceptionally dry year of 1899-1900, the discharce was copous even in April. This small work irrigated (16) acres of dry crops that year which savel the threa villeges from slavration. I think similar experiments should be made on other streams in this region.

I would recommend the amo in Navapur Petha in the remote west of Khandesh (which is really a part of Gujrat), where the mortality during the last famine was very heavy. There are several bandharas here in ruins, and these should be rovived, as the streams here, being near the fact of the Ghals, are more or less personnial. The Executive Engineer for Irrigation is gradually taking up these works as minor works, but these works should be surred on a much larger scale.

5. Much has already been said about the unpreparedness of a district as regards irrigation programme.

Preparation of famine projects, in times of famiac. In 1866 and also 1809 the Collectors of Khandesh and Nasik were very anxious to start irrigation works in place of metal-breaking and read-making, but I was only able to start one work, the Tulmada Tank, in 1869, which was completed in that senson by 3,000 relief workers. The Furnapada Tank was badly wanted for relief purposes in November 1899, but owing to the incomplete cinto of the project, it could not be undertaken till May. If it had been started in the beginning of the senson, I think with the 15,000 workmen uvallable, the whole of this extremely useful work would have been completed by the end of the season. Similarly, I may mention I abivel, Mulber, and Manad Tanks. The project, although roughly ready—some professional points had to be carefully considered by Government regarding them. The puddle trench, being deep, required skillfut workmanship, and until this was completed, the embankment work coult not be started by relief labour. I respectfully beg to sobrid that, if these projects are thotooghly sifted and the skillful portions, uncluding outlet works, etc., are completed as ordinary works, in ordinary years, they can be utilized at once for relief purposes, when wanted, and lace that are spent—in urcless metal-breaking work nould be caved.

desirability of employing a special staff for prerandou of probes.

I would go further, riz, to construct the difficult parts of the more useful projects of class B—as mentioned in the above paragraph, and that nithout faither delay. I believe I am right in thinking that the final report of the Commission will not be ready before July or August, and if the Government wait till then, the special staff will not commence work till the next cold weather. If famine re-appears next year, we shall be in the same plight as before. I would therefore respectfully a ggestibut the special staff should be imponsed now, without waiting for the final report of the Commission.

7. The above recommendations may briefly be summar-

- 7. The above recommendations may briefly be summarized as follows:-
  - (a) Early completion of Chunkapur and Purmapala Tank Projects,
  - (b) Gradual construction of all the tanks of class Bins familie protestive works, in preference to others of class C, as they are intended to improve and extend the existing bandlara irrigation, and are therefore likely to be very successful. A sum not less than one has may be devoted every year for these works.
  - (c) Speedy completion of the juddle treach and other difficult portions requiring skilled labour of Duluvel, Manad, Mather Tanks, so that they may be undertaken as relief works, whenever necessity orises.
  - (d) Construction and restoration of bandharas on percannal streams of Shahada, Taloda talukas and Navapar Petba.
  - (c) Reserving tunks of class C for relief purposes only.
  - (f) Early preparation, by a special slaft, of a complete famine programme, so that one or two tulk projects may be ready for each Taluka or Petha, in case of famine, as mentioned in the latter portion of paragraph 3.
  - (g) To undertake silt clearance of channels in groups, and repairs to old village tanks, as test works in the beginning of a famine.
  - (h) To do may altogether with motal breaking and road making by famine labour in Khandesh, as already too much money has been spent in this direction.
- 8. I trust that the Commission will not consider that my report is too exhaustive. These points I fully intended bringing forwart in my evidence, but as the drift of the questions usked did not lead that way, I unfortunately omitted what I consider to be the chief points in my experience of Khandesh.

Mr. J., M.

# TWENTY-FOURTH DAY.

# Poona, 20th December 1901.

WITNESS No. 55 .- Mr. M. VISVESVARATA, A.M.I.C.E. Executive Engineer for Irrigation, Peona.

# Anexers to printed questions.

## Ţ.

Mr. M. Vis- Preliminary.—In comparison with other parts of the restaraya.

Presidency, Government have expanded large sums on irrigation works in the Peona District. The Mutha and Min 20 Pec. Cl. Charls are the two largest irrigation works in the Presidence, excluding Sind. The storage reservoir at Bhatghar, which supplies the latter canal, is the largest io India after the Periyar.

All the new irrigation works for which Capital Accounts are kept are situated in the southern half of the district. The culturable area commanded by the works is 259.81 acres, or about 12 per cent. of the total culturable area of the district. There is room for further extension, especially in the northern half of the district.

The following table gives the Capital outlay, Revenue results, &c., of the irrigation works in the Peona District as compared with the works in the Presidency (excluding Sind) taken as a whole:—

	Whole Presidency excluding Sind.	Poena District.	Percentage of (3) on (1):
1	. 2	3	4
Capital expended Laklis Es	203 23	131	50
Area irrigated in 1859-1900 . Acres	101,621	88,742	57
Gross Revenue in 1859-1960 . Re.	2,25,561	1'61'+12	, c7

According to the results of 1893 1909, while the Carliel expended in the d'errict was one-half, the pross recome was two-thleds of the whole. The percentage of mit revenue on outly was 170 as against 07 only for the rest of the Presidency. The reason of more favourable results in this district is that large etorage works which have an unfailing ghant supply have been constructed in combination with carels which reach down to tracts of scanty or nucertain rangel.

Paragraph 2.—The gross area of Poona District is 3,423,609 arres and the culturable area 2,692,754 arres Area protected by Government irrigation works is 137,220 acres only, or 5-5 per cent.

The country is hilly and the culturable area vails from light sandy to yieh black soil, generally with murum from 1 to 3 feet below the surface.

The minfall varies from 185 inches at Loudvil on the ghants to about 23 at Lu2spur in the eistern most tiloka of the district. Except in the grant region, the average minfall varies from 23 to 20 inches, but is generally below 25 inches.

In the western portion of the Poona District there is columnity no demand for water during the southwest monster except for percantal engage the sugarcars and conden crops. Water is required for these at intervals of 10 to 15 days according to nature of a days according to nature of a days along the sugarcary.

Artificial irrigation is almost always in demand in the central and castern parts of the district.

The following information relates to crops mised by irrigation:-

Na'ure of crop		Period of the year wher water is required.		Number of water-	bring the crop to	maturity.
				!		
l'erenotal .	•	All the year room! .		: 20	fo	<b>32</b>
Eight mentle	•	July to end of February		. 12	10	15
Moreson dry		July to October .		; 1	to	4
Do. net		Do		. 4	10	6
liabi		October to Fibreary		3	to	6
Hot wentler	•	April to June .	•	, 6	to	8

The lighter the soil the more frequent the need for water-

Tre distribution of water is central ed by dividing the indicated area into a ctions in charge of Smi-Oversteen and Inspectors and the a client egain into sub-sections, each looked after by a l'atheri who distributes the nater.

The area irrigated is measured each sesson by a special measuring establishment and demand statements are seen in to the Collector for realizing the water-rates

The rate- are levied a wording to the class and area of errors were ed.

Paragraph 3.—Dant constructed of pure black will are nover satisfactory or safe. But black soft is used (a motimes with an admixture of sand) for the learning or one of american dam, with cosings of murum or other satisfact material. Makency care walks are not in use in the 11-ccan.

Black toll is god for angazone and garden only grown by intigation, but it requires monte.

On such a lithere is demand for water for cereals and food-grain ere; sonly in case of prolonged drought. Where there is chrome debricacy of raiofall, there is demand for water every year on black soil also.

Wherever the irrigation is limited to measoen or rabi errps, the demand for water is slack in years of fair or go d rainfull. With a personnal supply available for growing high class crops the demand is more or less seemined.

The revenue in this district depends chiefly on the area of sugarcane and garden every for which water is available. Black soil is better saided for high class crops than any others, and it is no deadminage to have black soil where the supply is personnal.

Owner of black soil desire to have irrigation weeks on necessary of the opportunities they provide for growing juntiana other fordering crops in a year of security religious and sugartane and garden crops during from of near if simfall.

Paragraph 4.—There are six irrigation works in this distict, particulars regarding which are given in (1) the latest Irrigation Revenue Report and (2) Appendix X of my manorandum on Irrigation Works separately submitted to Government.

As the Superintending Engineer on special duty has collected this information, it is not soparately given here.

The annual irrigation capacity and rauge of variation are given in Statement I attached.

The Nira and Mutha Canals can be depended upon in a season of drought. The other tanks are only partially successful in such reasons.

The rivers and streams in the northern part of the district are suited for extension of irrigation to that region. There are none now there except a few small old works of little or no value for irrigation in a season of drought.

Paragraph 5.—I here are nu Provincial irrigation works in the Poons District.

Paragraph 6 - There are very few village works in this district and these are used for drinking water and washing eattle. The construction of village tanks and weirs on small streams can be encouraged if funds are set apart for the purpose. The villagers concerned should be held responwille for their upheep.

The village tanks will provide water-supply for men and cattle. When the tanks ran dry, the subsoil water level in the neighbourhood will be high and wells in such places will supply water for irrigation as well as for drinking and

Paragraph 7. - Construction of new wells can be stimulated by liberal advances to enterprising cultivators who are not in debt.

Enquiries show that during the drought of 1699-1901 the water-supply of wells ran short; unly about 25 per cent. of the wells in the entern part of the district were in use.

Douth of wells varies from 15 to 25 feet in kachcha wells and from 30 to 40 feet in pakka ones.

Cost of pakka wells . . 1,000 to 1,500. " kachelin wells and budkles . 200 to 500.

Paragraph 8,-'I here has been very little damage done in this district by water-logging or excess of water. No

drainage works are required. The cultivators use tee much water when they are allowed with the result that the quality and value of crops suffer.

The rules for distribution and menagement of water which have been in force in this district for the past 16 months provide for light waterings and frequent olesnres of distributary chennels and are calculated to prevent injurious effects from excess of water.

Paragraph 9.—The information under this hend will be supplied by the Seperintending Engineer, Central Division.

Paragraph 12.—Statement I attached gives the initial statistics asked for in Section I of the paragraph.

Information as per Section II is being supplied to the Superintending Engineer on special duty as far as possible. Paregraph 13. - The scale of water-rules is given in

F attached to the Irrigation Revenue Report for 1899-1900.

Applications for water are received by seasons and for perennial crops nanually.

Outlets are opened in rotation and water is given on each distributary from the lowest field upwards. When all the fields are watered, the outlet is closed. Water for sugarcane is given once in ten days as far as possible, except towards the lower reaches where the supply is not constant.

During favourable rainfall the demand for water for cereals and food-grain crops is slack as already explained. For sugarcage and garden crops the demand is more or less constant and is partly independent of ramiall.

The water-supply of tunks in this district is so controlled that they are empty, or nearly so, by the end of June. The smaller tanks dry np earlier. In Lake Fife a proportionately larger supply is maintained to onsure the supply of water to the Civil and Military station of Poona.

The irrigation works got no credit for the increase of land revenue by reason of their construction.

In the Pooun District the charges for maintenance and establishment are fair.

This is not the case in districts like Nasik and Ahmednagar as explained in a separate memerandum.

14. The areas irrigated and the estimated value of crops

NAME OF WORK.			Area trigated.				Retimated Value of Irrigated crops.			
		1696 97	1807-89	1600-1909.	1900-01.	1590-97.	1807-03.	1699-1900.	1900 01.

	Toral	52,037	G6,703	88,862	65,110	40,83,204	25,89,560	29,03,427	59,00,40	

The year 1898-99, not being a famine year, is emitted.

All the villages under the first 25 miles of Muthn Canni and for about 60 miles of Nira Canal were protected. only this, but large numbers of people from unprotected tracks also found employment in held operations in connection with brigated crops. The Minor works gave portial protection to from one to three villages only.

protection to from one to three villages only.

Assuming an average cultivated area of 1,600,000 neres for the district, and the yield in a funine year taken at an average rate of its 6 per acre, the total valuation of the produce of the district will amount very roughly to its 96 lakis. The above table shows that the produce due to irrigation varies from 25 to 60 lakis annually. This forms a very appreciable proportion of the total produce of the district, and bearing in mind that the wealth accommulated by means of irrigation works in previous years also helped to mitigate distress, it may be confidently unserted that but for the irrigation works the cust of relief in the district would have been increased by 25 to 56 per in the district would have been increased by 25 to 50 per rent.

# A.-General.

1. The miswers below refer to the Poona District in particular, but opinious of u general nature apply to the Deccan Districts as a whole. I have served in the Khandesh Irrigation District and as Personal Assistant to the Superintending Engineer, Central Division, and have for the past 22 year held exceptive charge of the Poona Irri-gation District.

2. The average rainfull in each mouth of the year in Poona and Indapar, the two representative stations of the district, is as under : -

Mont	<b>.</b>	Peçun,	Indapur.	Remare.
January February March April May June July August September Ostober November December		2.70	Inches. 0 02 0 09 0 28 0 50 1 49 3 03 2 04 1 86 6 90 2 97 0 80 0 03	The average is taken for 10 years onding 1900.

Mr M. Fisvesvaraya.

20 Dec. 01.

Mr. M. Visresvaruya.

20 Dec. 01.

3. (1) No obstacles.

(3) Yes. Slight for high class crops, but not

serious.

(4) Yes. In the case of cereals and food-grain crops which do not require irrigation in a year of normal rainfall.

(5) Yes. Insufficiency of the supply of water is all cases in a year of drought and chronic uncertainty in the case of small tanks on the plains.

(6) No great obstacle from lack of capital in this district.

(7) (The fear of enhancement of revenue exists in the case of well irrigation, though it is in most

cases groundleso (9) These are dealt with in a memorandum separately

submitted by me. 6. As irrigation does not afford any special facilities or advantages for the cultivation of cereals and pulses, except during a drought, irrigated tracts do not attract any large

during a drought, irrigated tracts do not attract any large namber of outpurature. People with capital and enterprize sometime lease, for a time, land under command of irrigation works for growing high class crops.

There is a very strong desire among the people of this district for new irrigation works where there are none and for extended means of irrigation where works exist

# B .- Canals of continuous flow.

7. (1) Two harvests in a year in irrigated tracts are rare, because black soil requires maoure, and during years of favorable minfall people do not go to the trouble of cultivating for two barvests, except where land is valuable.

(2) In this district wherever water-supply is good there is great demand for engarcans and guiden crops. Sugarcano is valued especially because the seed once sown gives from two to three harvests and occasionally up to six.

from two to three harvests and occasionally up to six.

(3) In a year of numblo reinfall there is no appreciable increase by irrigation in the value of the produce of land in the case of ordinary orops. In a year of scanty rainfall ordinary crops are improved by irrigation, and in a year of drought a good crop is obtained by irrigation where without irrigation there would be nose.

If water-supply is available for perennial crops, the gross yield may be increased by about five times, but much depends on local conditions.

depends on local conditions.

8. This depends on the nature of the water-supply and

the crops grown.

(1) In the cess of cereals the gross value of the yield is increased by about 20 to 70 per cent with sufficient mannro.

(2) The crop is saved from total ruin.

9. (1) Ou the Nira Chaal the average water-rate paid to Government is about Rs. 3\frac{1}{2} per sers. On the Mutha Canal the rate is much higher on account of the large area.

(2) About Rs. 6 for ordinary oreps and Rs. 15 to 20 for

(3) Ni, except on second class irrigation works where a consolidated land and water-rate is charged.

In the first case, the rate is paid on the area actually irrigated during the year; in (2) sometimes on actual area and sometimes on the whole holding; in (3) on the whole irrigable area.

10. The expenditure to bring the water to the field varies according to the distance of the Government distributary and local circumstances. The work is usually done

bntary and local circumstances. The work is usually done by the cultivators themselves.

Roughly, the initial cost of the field channels may be taken at about its. I per nore and annas 4 for namual maintenance. For preparing land for sugarcane the rate is about Rs. 16 per nore.

The expenditure is iccurred by the tenant who recoups himself by the value of the produce.

11. The health of the penale is affected when there is irrigation too near a village. Government have prohibited extension of urigation of perennial arops within a quarter mila round all villages under command of canals.

In places, the soil has also deteriorated as noticed by the poor quality of the crops.

poor quality of the crops.

Ou the Mutha Canal, the hand bas got water-logged in a few places, but the aggregate aren is very small. The irrigation under the Mutha Canal is of about 25 years' etanding.

The evil is arrested by the system of rotation now in force. Draining is resorted to by the cultivators with very satisfactory results

# C .- Canals of intermittent flow.

12 to 21. Works of this class are not numerous in the Peona district. I have a general idea of their management, but here no intimate acquaintance with the details.

22. There should be no objection to the construction of 22. Increase and the no objection to the construction of further canale by private persons who own the lands proposed to be irrigated. They may collect the necessary funds among themselves for initial onlay and consent to pay an enhanced water-rate on the area to be irrigated. Government might resist either by a contribution towards the construction of the work or by promising to forego water as-essments for a fixed term after construction.

Before new works are undortaken, Government Engineers should inspect and report on the proposals to ensure that new works do not interfere with the supply to existing carals.

### D .- Tanks.

23. (1) Tanks in the Paona District are replenieded by rainfall.

The Matcha tank is fed partly by rainfall and partly by monacon flow in the Mutha Canal.

- (2) Water is conveyed by channels to the fields to be untered and controlled as described in previous answers.
- (3) In a year of ample rainfull, throughout the year; in year of drought, about the end of the cold weather depending on the rainfall.
- (4) Depends on the size of tank and class of crops watered (vide Statement I attached).
- 26. Yes. When the supply from the tank fails, the cultivators who have sugarcane and other high class crop fall back upon wells for their supply. I consider wells should be opecially occouraged in land commanded by tanks and by the tail persions of canals where the supply is not peronnial,
- 80. The principal distributaries are maintained by the tank establishment; the field channels are kept in repair by the cultivators.

Approximate annual cust of maintenance is about lie. I par acre. With high class crops, it is higher. No legislation scens required.

32. Pleaso see answer to question 22.

The construction of private tanks may be encourged in seasone of drought to give employment to rolled labour. The cultivators require special encouragement and concessions where the laud to be subnetged is not Iném or private laud.

33. The accumulation of silt in Bladalwadi and Shirenphal tanks in this district has been at the rate of 0 83 and 0 09 per cent. per annum, respectively, calculated on the total capacities of the tanks.

In large reservoirs the accumulation is so small as to be inappreciable in a generation. In the Bhatybar Reservoir, under-sluiers are provided to prevent silting.

- 34. (1) The average depth of pakka wells is 30 to 40 feet, and the level of water at the beginning of the hot weather may be taken at 20 to 30 fort below ground surface.
- (2) Chiefly from springs and where the wells are under a canal by percolation from the canal. For purposes of irrigation only about 25 per cent of the wells are useful in a year of dronght.

There are very few localities where the water is saline in this district.

- (3) Please see reply to paragraph 7 of memorandum
  - (4) About 75 years.
  - (5) By mots only in this district.
- (6) By n well of one mot, 4 sores.
- By one of two mote. 8 to 10 neres.
- (7) Varies according to crops and scasone and depth of water, but generally with a well of one mot, 2 to 3 nores of sugaroune, 4 to 6 acres of fruit-trees or fond-grain crops.
- 38. (1) Serious difficulties are experienced in the selection of a suitable spot.
  - (2) Not much diffi nlty in actual construction.

No expert advice is given in this district It would pronote coolidence in well-sinking if such advice were available. If one trained Upper Subordinate of the Public Worls Department is employed for two or three districts, he will be able with the aid of a small staff to take levels and trial borings and thereby offer usefol advice.

39. Yos, to a limited extent.

Welle may be constructed at the junction of two or three fields owned by different owners.

The chief objection is the cost. The Government work will be more expensive, though very substantial, by reason of the cultivators' labour not being utilized.

People and agree to take water for specified areas for a fixed torm of years. The wells should not be constructed too 20 Drs. Ol. close, but at distances varying with the underground supply.

40. Yes. Bulkis, i.o., wells on the banks of nalas, They are useful for mension and rabi crops during years of drought and in ordinary seasons for vegetables and occasionally for perenaist crops. When the rainfall is seanty, the streams also run dry, and their protective value is therefore limited. If a supply of mot appliances with fixtures are kept ready for sale or hire, it will be a great encouragement to well irrigation during seasons of drought.

III.—Explanatory note, dated 31st December 1901, on the evidence given on 20th December 1901, before the Indian Irrigation Commission, by Mr. M. Vieves-caraya, Executive Engineer for Irrigation, Poona.

From the experience in Northern India, Slad and the Madras Presidency, the Gorernment of India neutly associate improved management of Irigation works with extension of area irrigated. They have laid down that many of the irrigation works in the Bombay Presidency were undertaken "with the object of affording relief in seasons of drought" and af "furnishing nearer-supply for cultivation in seasons of deficient rainfall." The impression has therefore prevailed that an extension of irrigated area is expected in seasons of drought, and that the water-supply in such ecasons should be madr available for growing as large an area of food crops and cricals as possibly in preference to percanial and other valuable crops.

- 2. If the works are of limited value in normal seasons through slackness of demand, the Government of India naturally expect a large extension of area in seasons of drought. But there is no large extension nuticeable. When the minfall is normal and the supply abrudant, the staple food crops do not require weter. When the rainfall is deficient and there is demand for water, the rivers are low and tho tanks not full, and the water-supply is not sufficient for the whole area classed as irrigable.
- 3 The members of the Commission have stated that it a memore of the Commission have stated that it is not the desire of the Government of hudla that water should be received for food orops, in a reason of drought at the sacrifice of richer crops, and that no restriction of irrigation of perennial and high class crops is intended in such years.

This interpretation does away with one of nur chief difficulties, and clears the ground for the introduction of suitable measures for making the works more useful and remunerative. If worked on productive lines, the irriga-tion works in the Decem will yield more resenue to Government and do much more permanent good than at present to the area served by them.

4. In clause (9) of paragraph 55 of my memorandum I Proposed where of Re- bave suggested a scheme for pro-trate Menagement of large finably utilizing the mater supply works. works would be protective doring years of searcity and productive in all other years. I have there proposed that the area under each work should be divided into three classes, namely, (1) the fixed, (2) the permissible, and (3) the dry arm. the dry crop.

As the Commission would place no restriction on the irrigation of high class orans in scasons of drought, the scheme can be simplified. I should now have only two classes, viz., (1) the fixed and (2) the permissible.

About two-thirds of the minimum water-supply uvailable may be set apart annually for the "fixed" area. The remaining one-third and any surplus water there may be in good years may be used as at present at the iliserction of the local officers for food grain or rich crops according to the character of the season and circumstances of the locality.

The "fixed" area will be distributed by villager, and each village may be given one or two blocks at a fixed rate of a sacesment per acro on the whole area of the block. Applications may be accepted for, and reaswed once la, six or ceven years.

It would not be desirable to guarantee water to other areas than those meladed in the regular blocks, as the waste of water in the channels will be large. There should be one channel and one outlet if possible to each block, and the water-supply should, as far as possible, be by measure.

If, with the same water-supply, the cultivators irrigate a larger area by a common understanding among themselves, the excess area, that is, area irrigated outside the block, may be separately measured and charged for.

Of the " fixed" area it may be stipulated that not more than one-third shall be sugarcane or other perennial crops.

Also the fixed area should not eccupy more than one-fourth or one-third the total culturable area of the village.

The area should be large enough to make the whole body af cultivators take an interest in irrigation, but not too large to constitute a surfelt or to get water-logged. A small defined area in each village will enable people to concentrate their capital, manuro and skilled labour, and to take the naturest advantage of 1 be water-supply given to them them.

The water-supply to the blocks may be guaranteed for six or seven years at a time as already explained and the rates of assessment revised at such intervals. The area assigned for the blocks may be changed also at each revision, if in the interval any portion of it has deteriorated by water-logging or other causes, or if the people desire a change. a change.

During the mensoon, water may be given to food grain crops and cereals without water opplications wherever the caual is large enough for the purpose. The privilege may he withdrawn by notification from the whole or stated lengths of canal whenever the water-supply is not in excess of what may be required for the "fixed" area.

Farther details may be worked out according to the requirements of each locality.

requirements of each locality.

5. The storage of the Bhatghar Lako is roughly 5,300 million cubic feet. Twa-thirds of this, or about 3,500 million cubic feet, may be set apart for sagarcane and other perennial crops. At two acres per million cable feet (the duty will be larger with black irrigation), this will suffice for about 7,000 acres. Twice this area or about 14,000 acres may be allowed for eight months and four months crops in rotation. Supposing half this area is irrigated outside the monoon months, the additional storage required will be about 500 million cable feet. The total storage reserved for the "fixed" irrigation will thus be 4,000 million cubic feet, leaving 1,800 million cable feet for the premissible ares, including rabi crops at the tail of the canal. tail of the canal.

Water will ordinarily be available for monacon crops without stint over the whole area.

These measures will latroduce an element of fixity into the traction of the tract generally, give opportunities for the application of capital to land and time for the collection of manure, improve the revenue and bring increased prosperity to the villages under command.

6. I was asked why water appli ations should not be dis-Water aggftentione. Water applications controls instances the difficulties likely to arise if the area irrigated were not kept nuder control by incine of water applications.

control by incens of water applications.

In 1899 the water-supply of Lake Fife (Mutha Canal) was deficient by reason of the failure of the later monsoon rains. For two or three year-previously the demand for sugarcane was slack on account of plague and the low price of "gal" or raw angar. So we went on giring water for sugarcane to whoever asked for it till about April 1900. We then found we had only just enough water for cropy alrealy on the ground and had to restrict new sowings. As sugarcane cultivation was particularly profitable in that year, a large number of people had spont money on manure and prepared their lands anatwithstanding they were warned by written notices. We did what we could to meet the demand, but the water-supply fell short of the demand and there was disappointment and complaints. ment and complaints.

In the briginning of 1991 also, people were anxions to put down as large an area of angarcane as possible, so much so that some of them extended their area of came by stealth by utilizing for new sawings the wa'er given for erops stready soun. This had to be stopped by threats of penal assessment. If they had had their own way, the cultivators would probably have doubled the area. In all probability the supply would have failed in May or Jone, and crops valued at about Rs. 15 lakks perished in whole

Again, take the case of the Nira Canal. The shrage at the end of the last monsoon was about 5,200 million cubic

fect. About half the supply is given for sugarcane and bigh class crops and the balance for rabi crops. The rabi supply will be used up before February next, leaving just enough storage to maintain about 5,500 neres of perennial crops till the next replenishment in June or July next. If no restrictions are placed on new sowings, the area would probably go up to 8,000 seres, and the water-supply would initialmost to a certainty in about May next, and crops voluced at over 20 lakks may be runed.

Careful regulation of area is only possible when permission is taken for extensions on regular water applications. Otherwise the water-supply may fail in the hot wenther, and the cultivators may be ruined. It costs Rs. 150 to its. 500 to prepare an acre of land for sugarcane. With borrowed capital, the tisk of even a partial failure will result in loss of confidence and a suddon contraction of area and respected. traction of area and revenor-

7. In Northern India, the water-supply is chiefly from Reasons why water appli-large rivers. They profer to callons are necessary on admit into the cased us much large works in the Peccan, water my they can take; for whetever apply is not drawn poer to waste down the river. They prefer to waste the water, if it should be wasted at oll, along the canal where there is a chance of its being

In Bombay, on the other hand, we draw our supply from tanks or artificial reservoirs, and whatever supply is not drawn is so much saved for further use till the next replenishment. The supply saved may be used for extending the hot weather crops or for new sowings of sugarrane.

The demand for water for irrigation in Northern India is fairly constant. Here in Bombay, the area under an outlet may be 50 acres in one seeson and 500 in the next, depending on the character of the local rainfail.

Water is very expensive in Berthay. In Appendix II of my memorandum, I have shown thus an expenditure of Re. 100 has provided facilities for the inpartion of about five acres in Panjab, four in Madras antion ree in the North-Western Provinces. In Bombay the exact spouding area is less than half an acre. It may be rougher stated that, on account of the great cost of storage, water-capply is three to aix times more expensive here than on the other insignation systems.

more expensive here than on the other irrigation systems.

Careful regolation is important. On the Nira Canal, for instance, the hot weather discharge is frequently not more than 100 cable feet per second in as tunny whice of canal. It is necessary to promibit irrigation at the tall portions of main canal and distributaries, herause more water is lost by percolation and waste in transit than is actually applied to the crops. Regulation is not possible without we know what area there is to water under each cotlet, and for watering which the Canal Department has accepted responsibility. The areas have to be determined beforehind, approximately at least, if the regulation is to be effective.

Remarks on suggested canal should not be classed as permissible." If this were done and water liable to be withdrawn from valuable or ops on the appearance of scarcity, only rich people would risk capital, and there would be no great demand for canal water in ordinary seasons. The expense of using wells for a part of the year is large and the wells may fail. The risk is too great for the average oultivators who undertake oultivation with borrowed copital.

A further suggestion was that cultivators might be given water from year to year till they relinquished the area. This, if followed within safe limits, would be an improvement on the present system. The objection to it is the loss of water on a net work of distributory channels which are necessary for maintaining scattered patches of irrigation. The loss of water, especially during the hot weather, would be out of all proportion to the area watered. Concentration is most important for economizing the supply in the hot weather. Hence my suggestion for irrigation by blocks and the allotment of one or two blocks to each rillage. The blocks may be shifted from one part of the rillage to mucher once in six or seven years as

O. While I believe water applications in some form Water applications may be or other ure a necessity on large dispensed with for small works, I have advocated their nbolitian in the case of the smaller works. I attach much importance to the suggestion made in section (10), paragraph 55 of my memorandum, to sabiah Than motorana. which I hog reference.

10. Closely allied to the recommondation in the previous

Management of small the transfer of small works to the transfer of Management of small works by Civil Agency.

(6) and (12), panagraph 55 of my memorandum. Works conting, say, less than fls. 3 lakks, may be so transferred. Important or difficult engineering works may be maintained by the Public Works Department, but the maintenance of minar works, channels, stc., may be left to the villagers, nador some recognized rules, for control by the local Revenue officials as in the case of the second classification works. There are too many small works borne on the list of works for which Capital accounts are kept in this Presidency. The capital expended on works in Bombay is only about seven per cent. of the total expenditure for all India, but the number of works here is 40, out of a total of 124 (rhide paragraph 15, also Appendix III of my memorandum). Small works are an exception in other Provinces. They should be constructed by the Public Works Department, but may be managed, as in Madras, by the Revenue Department. The revenue on these works is assessed and collected under rules not suited to them, the funacial results are unsatisfactory, and, as the results affect irrigation works in the presidency as a whole, the larger works suffer by association with them.

# IV .- Memoraudum on Irrigation Works in the Bombay Presidency, excluding Sind.

# 1 .- PRELIMINARY.

During the successive famines in the Deccan since 1890, During the successive famines in the Decean since 1890, the coostruction of a number of irrigation works, principilly tanks, has been nedertoken as relief works. With the re-establishment of ordinary agricultural conditions, the works are being closed one by one; and the goestion now arises whether the works should be left incomplete, until perhaps there is demand for them in a future famine, or they should be pashed on and brought to an early completion. Are the works to be regarded merely as aids to famine rollef, or have they any higher value justifying the onlay and construction for their own sake? Before attempting an answer to this question, it is necessary to examine carefully the results of the irrigation works, already constructed in the Presidency, in the light of similar results of similar works in other parts of India.

similar results of similar works in other parts of India.

2. A comparison of the financial results given in Appendix IV clows that the net return for the year 1899-1900, on the Capital outlay on irrigation works in Bombay, was 1'd per ceed, while the average for such works for all India was '6'd per cent., and the maximum for any one province amounted to nearly 10 per cent. Comparing the areas irrigated in the same year (Appendix II), it will be seen that, while in every other province with the exception of Bengal, irrigation kept pace with the facilities provided, about a third only of the irrigable area in Lioubay was actually irrigated.

3. Opinion of the Government of India.—These results which have been more or less the same in all recent years, have discredited the Bombay works in the estimation of the Government of India. The nound grants for new works have in consequence been curtailed and the strictest economy

No. 23-1, dated the March 1813; Review of the Bombay Irigation Reviewe firm Reviewe firm Reviewe Report, Resolution noted in the maintenance of March 1813; Review from the Government of India 1801-92.

the Account Frequency in the State of Inches in the Margin is a Resolution noted in the margin is a forcible expression of the opioion of that Government on the operation os a whole:—

1. The irrigated area of 1801-02 shows an increase of 21,207 acres which is said to be due partly to an increase demand for water cased by deficient rainfall and partly to a the axional for water acres of the reaches of the proper of the demand for water cased by deficient rainfall and partly to the extensions carried out en some of the works. Considering that drought prevailed over n large area to the Decean districts and that many of the major and minor works under notice were undertaken with the object of affording relief to that area in soasans of drought and that the nercoge brought under command of a water-supply is very largely in excess of that for which water was taken, the increase in the irrigated area is much souther than might have been expected. Viewing again the large expenditure incurred in the construction and upkeep of these works, the Government of India cannot regard as attisfactory the results obtained, and will be glad to receive from the Government of Bombay an explanation of the from the Government of Rombay an explanation of the reasons why greater progress has not been achieved in

Mr. M. Vis. extending the irrigated areas below new works of irrigation resvarays.

in the Deccan as to the efficiency of the several works in farnishing a water-supply for cultivation in seasons of deficient rainfall nad whether they are worked with careful regard to their offsective utilization for that service."

regard to their offective utilisation for that service."

4. Object of this memorandum.—One of the objects of this memorandum is to bring into relisf the special features which differentiate the works of irrigation in Bombay from those of other provinces. For instance, un extension of the irrigation of the monsoon or other food-grain crops almost everywhere in India means an increase of revene and improved returns on Capital outlay. But this is only partially trus in Bombay. In 1895-97 the total irrigated area in Bombay exceeded that af the previous year by 674 per cent, but the corresponding increase in the ussessed revenue amaunted to 22 per cent, only. This shows that there are certain distinctive features in Bombay irrigation which have to be reckened with, and which might necessitunore are certain distinctive features in Bombay irrigation which have to be reckened with, and which might necessitate meditiontions in the eyetom of administration and assessments to adapt them to local conditions. The directions in which changes may he made with advantage will be indicated and the question will also he discussed as to how far the results and possibilities of these works justify the unfavourable estimate formed of them.

the unfavourable estimate formed of them.

5. Class of Irrigation works considered and basis of comparison.—The irrigetion works considered in this memorundum are those chased as Major and Minor Works for which Capital and Revence Accounts are kept in the dinancial accounts of the Government of India. The results of working of the official year 1899-1900, us given in the Government of India Review of Irrigation Works in India for that year (vide Government of India Review No. 859.—C. W. I., dated 28th July 1901) will be taken as the basis of comparison for the various provinces. Though the year was marked by famine conditions over a large prea, the results of that year are fairly reliable so ngaide to the relative value of the several systems at the present time. The results of other years will also be referred to as occasion requires. Out of the total outlay on new irrigation works in the Bombay Presidency (Decean and Gujarat) more than 30 per cent. (vide Appendix IX) is invested in works in the Docean. Whenever, therefore, Bombay works or Decean works mentioned in the Irrigation Revenue Report for Bombay (excluding Sind) are meant. Sind is treated as a separate province for purpasse of this comparison.

# 2.—Conditions of Irrigation in Bombat confared with other Provinces.

6. Financial results of Irrigation works in the various provinces.— Details of Capital ontlay and percentages of net revoune for Major and Minor Works for which Capital Accounts are kept are given in Appendix IV, from which the following figures are extracted:—

Province.	Total Capital Outlay to and of 1 899-1900.	Percentage of not Revenue on Capital Outlay, 1g39-1300.	Remarks.
Bombay, Deccan, and Gujarat Bombay, Sind North-West Provinces and Ondh Panjab bladras Bengal All India, including Minor Provinces	Million Bs. 26-78 21-75 90-14 96-68 81-57 62-35 389-78	1.4 8.7 7.2 9.9 7.4 0.7 6.4	Worke in the Minor Provinces costing oftegether about 105 lakes are not separately considered in this comparison.

Out of the total outlay of 3892 million rupees, Bombay has received a little over 262 millions, or nearly 7 per cent, for its chare. During 1892-1900 four of the above six eystems gave a return of over 71 per cent., Bombay gave 12 per cent., and Bongal less than 2 per cent.,

7. As a succession of unfavourable seasons in various parts of the country since 1896 created a demand for irrigation and in parts diminished the water-supply, it may be interesting to compare the above with the results before

The following table gives the corresponding figures for the year 1895-98:—

· · · · · · · · · · · · · · · · · · ·	•		
Province.	Total Capital Ontlay to end of '835 f6.	Porcentage of not Revenue on Capital Outley, 1895-96.	Romarks.

All India, including Minor Provinces	10,000,128	13,921,756	39

9. In Appendix V n camparison is made between the several provinces in respect of physical features, local peculiarities of cultivation, assessment, etc.

Bengal.—Bengal hes an ahundant rainfall, and irrigation is not practised in that province as an ordinary part of cultivation. Rice is the only crop for which irrigation is practised extensively in this province. Ont of 754,577 acres irrigated in 1899-1900, 691,073, or over 78 per cent, were under rice. As Boagal shows even less favourable results financially than Bombay, that province need not be further specially considered for purposes of this ounquiry.

specially considered for purposes of this ouquiry.

10. Sind and Punjab.—In Sind the rainfall is very scanty, and cultivation is ulmost entirely dependent on artificial irrigation. Extension of cultivation is dependent ulmost entirely on the facilities for irrigation. The annual inundation of the River Indus fertilizes the soil, and the people are used to irrigation. Many af the old canals have been improved and extended. The new canals are constructed at a comparatively small cest, and are extraordinarily remunerative. The conditions in Sind and in South Panjab, where the practice is similar to Siad, are totally different to Bombay. In North and East Panjab the conditions are somewhat similar to the North-West Provinces, and will be referred to in speaking of that provinces. will be referred to in speaking of that province.

will be referred to in speaking of that province.

11. Aladras.—In Madras, again, the most extensive irrigation is in the deltas of the epring-fed perennial rivers like the Cauveri, Krishun, and Godavari. Irrigation is also practised from tanks chiefly for growing rice. Rice in that province is both a monsoon and rabi erop, and is not ordinarily grown without irrigation. The principal use of irrigation in Madras is the stimulus given to rice cultivation. Out of 3,229,024 neres irrigated in 1898-99, 2,977,008, or 92 per cent, were under paddy or rice. If rice is excluded, other irrigation, including the perchaial, is mall. Irrigation is thus mainly a question of rice cultivation in Madras.

12. North-West Provinces.—In the North-West Provinces irrigation is practised from large canals taken from rivers like the Gauges and the Jumna. These, rivers are fed by the Himnlayan snows, and contain a large supply of water throughout the year. As the minfall conditions in the North-West Provinces are similar to Hombay, a good crop cannot always be depended upon in ordinary years. The difference between the two tructs, however, is that while monsoon or dry crops always benefit by irrigation in the North-West Provinces, the soil of the Decean is such that irrigation is only of partial value for protecting the staple crops of the nrea except during severe drought. The area under wheat during 1803-09 was 895,389 acres out of a total irrigated area of 2,253,802, or nearly 40 per cent.

13. Decean, rugged and broken.—Unlike the plains in

13. Docean, rugged and broken.—Unlike the plains in the North-West Provinces and the river delias of Madras, the Decean country is hilly and undulating, and the con-struction of large canals, where feasible, is a matter of

great expense.

14. Necessity of storage tanks in Decean Irrigation.—
Wherever irrigation is extraordinarily remanerative in
India, it will be found to be dependent on inundation or
perenulal flow. There are no perenulal rivers in Rombay
fit for irrigation on a large scale without the aid of storage
tanks. The rivers on which patches of irrigation exist
carry large volumes of water in the monsoon, but they
either dry up or dwindle iate small streams of little or no
value for irrigation in the bot meather. The cold weather
supply is also small. For irrigating the higher classes of
erops it becomes necessary to store water in the monsoon erops it becomes necessary to store water in the monacon for supplementing the natural flow of the rivers throughout the year as required.

16. Works small and scattered.—Again, the Deceme works are small and scattered unlike the large system elsewhere. Out of 124 works in India for which Capital Accounts are kept, 49 me in Bombay (Appendix III). The average cost per work for all India is 803 laklas of rapecs, while that of the Bombay works is 62 laklas only.

In large tanks there is comparatively less ioss of water in the second of the second o

16. Labour scarce and expensive.—In the North-West Provinces and Oodh the density of population per square mile is 486 (Appendix I), in Madras 262, and in Punjah 189; while in the Decean, where the greater number of Bombay irrigation works lie, it is 165. The population is sparse and labour is comparatively scarce and expensive in the Deccan.

17. Comparison with Madras tanks.—The only other province, besides Hombay, where tanks exist on a large scale is Madras, though even there tanks are not the mest successful irrigation works. The reason why tanks in the Madras Presidency are more reunnorative than in the Decae is that they are nosity of native origin and the Decao is that they are nostly of native origin and the Capital ontlay shown against them rapresents in most cases the cost of improvements only and not the real total cost. A large number of the smaller tanks (not works for which Capital Accounts are kept) perform a useful office in Aladras, namely, to protect the rice crop daring a break in the weather, while similar tanks would be of little use in Hombay. The small tanks collect water in a heavy downpour and give out during a break for the rice crop. In most tanks there is very little water left at the end of the cold season.

The soil of Madras in the districts where tanks are formed is generally more retentive, and the loss of water by leakage and absorption is less than is noticed from tanks and canals in Bombay.

18. Oss per acre of irrigable area high.—According to the reports for 1809-1900, the total irrigable acreage under command of irrigation works in the North-West Proviners is 3,076,000, and the Capital outlay on the works amounts to Rs. 901 lakhes, giving a rate of Rs. 29 per acre. The corresponding figures for Bombay are 316,425 acres and Rs. 268 lakhs, respectively, giving a rate of Rs. 85 per acre. The comparison is really more unfavourable than these figures indicate, because while nearly the whole of the area classed as irrigable is anothly irrigated in the North-West Provinces, the area actually watered in Bombay is about one-third only of that estimated to be irrigable.

10. Preponderance of black soil, Properties of black soil.—A good harvest can always he seemed in the North-West Provinces by supplementing the natural rainfall by artificial irrigation, whosever the former is found to be deficient. It pays the cultivator to sock the protection of the canal and to insure his even by contributing a small

water-infe. In the Decean, although similar elimatic Mr. M. Visconditions prevail, the soil is not favourable for the vesuaraya. irrigation of the staple crops of the province. Black soil, which is derived from trap rook, prependetates in the 20 Dec. 01. Decean, and black seil has a peculiar property of resisting ovaporation.

"The ullavial soil of the North," says Dr. Voeleker, "lands itself rather to eausis, wells and shallow ponds and the rocky ground of Madras to the tanks as well as to channels, while the central or black cotton soil needs neither particularly." The same authority says that "the retention of exersive moisture in the soil produces a state of stagnation and coldness unfavourable for the supply of clast food." plant food.

plant food."

20. Black soil does not freely lend itself to irrigation.—In good seasons the black soil of the Decean yields a full harvest and in ordinary years a fair harvest. During a partial break or drought, canal water is not sought for to save the dry crops to the same extent as is done in Madras or North-West Provinces. Such waterings are even found to be harmful in certain places. It is only in a year of severe drought that irrigation of dry crops is really useful, and that there is any large demand for water for them. Also, irrigation without manure is found to impace of the black soil. porerish the black soil.

21. Principal food crops not dependent on irrigation in Bombay — The rhief stimulae to irrigation elsewhere is the demand for water for food-grain crops. This is wanting to the Decean. In the North-Wost Provinces there are two crops in a year. The area under wheat prependerates. Coin, cotton, and other principal crops are grown in the rabi season and require irrigation. In Madras, as already remarked, both the early and late rice require irrigation. This is why irrigation is so extensively practised in these provinces. in those provinces.

22. Bembey cultivators not used to irrigation.—Are ference to Appendix I shows that the proportion of total irrigated area to tetal cropped area in Bombay in 1899-1900 was 4½ per cent, in Madras 25 per cent., in Puajab 72 per cent., and in the North-West Provinces and Ondh 33 per cent. The irrigation, here referred to, is from all sources, not merely from the Capital Account works with which the present enquiry is concerned. The figures bring out prominently the fact that irrigation is not an ordinary accompaniment of cultivation in Bombay.

One reason why well irrigation is not largely practised in the Decean and Madras is that the sub-soil over wide areas is rocky, which makes well excavation a matter of great

23. Dry-rrop irrigation will not pay in Bembay.—
During 1805-66 the area irrigated in the Decean and
Gujamt was 74,023 nerse, and the assessed revenue from
water-rates amounted to Rs. 4,52,476. During 1897-98,
though the area was to 126,516 nerse, the revenue amounted
to Rs. 4,93,139 only, so that with an increase of 69 per
cent in area the increase in pagenta was about 9 per cent cent, in area the increase in revenue was about 9 per coat, only. In 1897-98 there was a considerable increase in monsoon and rabi irrigation due to drought. The rate for monsoon and rabi irrigation due to drought. The rate for mensoon dry crops is generally Ro. 1 per acre, and that for rabi crops its. 2 per acre. At present the average working expenses amount to more than Ro. 3 per acre. If the whole of the area estimated to be irrigable at present, which is about three times the area actually irrigated annually, were put under monsoon or rabi crops, there would be a reduction instead of an improvement in the present revenue from water-rates.

The works may justify their oristence as "Protestive Works," but the accounts will get no credit for mero increase in area. Increase in the irrigation of ordinary crops will never pay in Bombay. Water is too costly to be profitably applied to them.

presitably applied to them.

24. Financial success bound up with improvement in high class cultivation.—Daring 1889-1800, although the area of percental crops irrigated was only about 12½ rerect, the value of trigated crops from the area was 47 percent, of the whole. The area under perennial eight months, and special bot weather crops, for all of which high rates are clarged, was only about one-fourth of the total area, yet the assessment on these three classes of crops alone paid ever 70 per cent, of the total water-rates of the year (bustement G, Irrigation Rovenne Report, Bembay). If the Bembay works are ever to prove remunerative, percundul and other high class irrigation should be largely encouraged in ordinary years.

If protection is the main object, and water-supply is to be reserved for dry crops, which may or may not take it while it could be otherwise profitably used for growing,

Mr. M. Vis- Percunial crops, a substantial contribution from land resonne resourage. should be credited to the works as is done in the North-West Provinces and elsewhere.

20 Dec. 01.

'S.—Present position of Irrigation Works in Decean and Gusabat.

25. Importance of irrigation scorks in the Central Dirision.—The following figures (Appendix IX) give the distribution of the works and the Capital outlay on them, among the three Public Works Divisions of this Presidence.

		Cests. Lakks of Rupecs,	Remarks.
t'entml Division .	30	211	Works under con-
Southern de	16	41	abernaceure not included.
Northern do. (Gujarat)	2	8	incluara.
Total .	36	263	

The Capital antlay on works in the Central Diricion is over St per cent, of the total irrigation outlay in the Decem and Gujarat. The greater number of the works and the most urputant of them are in this division. The area of uncertain rainfall in the Presidency is also the Director.

26. Works in the Northern Division.—There are only two Capital Account Irrigation Works in the Northern Dirision (s. e., Gujarat) coating together about 6 lakbs. There are the Hathmati Cayal and the Klani Cat. neither of which paid its working expenses during 1800-1600. In favourable seasons the former pays about 1 per cent. and the latter 2 to 6 per cent.

27 Blocks in the Southern Division.—In the Southern Division also there are few marks in arous of sounty or unsersonable rainfall. Almost all are however, useful on the occurrence of a drought. The intract went which is the fishal Urnal, let Soction. Lasguer a little over 18 likks. The Kilshna Canal is absulted more they by likks. The former is new and the latter wants a steam received. The question of providing storage arches for the Krishen Canal is mader consideration. The remaining tanks, if which there are only large at tangence than one likk (the largest met exceeding seven laths), call for no remain.

One perdicately of the Pharman table is that waver assessment recallected on some of them along with land revenue as a consolidated cats.

15. Works in the Control Division.—Affact all the works in the Control Division are either either by access of sensity mutall or affact prote time to such areas. The largest are the four felloming.—

			,	4	•

The set revenue from these four works fermel 63 per cent, of the total net resence. The retaining norks in operation taken together poid less that I per cent. The first two works of the four mentlined above may less considered as very successful works, although the revenue is not yet sufficient to cover the annual interest expected upon

the Capital outlay. The Mutha Canal is the oldest work. Though constructed primarily for famine protection, a large part of its revenue is derived from the water-sapply to the Peana City and the irrigation of the sugarcane cross. The canal is single-banked, and therefore expensive to maintain.

canal is single-banked, and therefore expensive to maintain. The Nim Canal is the largest and the mest recent work in the Presidency, and it gives every promise of successful working. It has proved its great value in the recent famine. According to the results of 1900-1901 (a famine year) the canal irrigated by Capital Account works in the Decean and Gujarat during the year. The value of crops amounted to about 40 lakins of supers. It is calculated that the area of food-grain crops freighted gave crops sufficient to feed a population of more than 12 lakin for six months. Without the canal the greater part of this area would have remained uncopped in such a year.

litt the Mutha and Nira canals are provided with storage tanks having ghat catchments. The remaining two works mentioned above are on the Deccau plains. Out of them, the Minavad Tank, had ind its full supply level restored only recently, and the Ekruk Tank is handicapped by the unentisfactory state of its canals, which, being single-bankel, are expensive to clear and resintain. Both tanks are in areas of scanty rainfall, and do not fill during years of famine.

29. Principal proulisations of Decean Works explained in Appendix A.—The principal conditation of each of the 38 works will be understood from the information given in, and the brief explanations entered in the remarks column of, Appendix X, to which reference very he made.

Of the 26 works in operation, eight imputant ones are dependent on elvers with a previous water-supply. Until storage tanks are provided for the latter, the best results cannot be had for the knoney invested in them. Nearly half the tend outlay is on norther which are admittedly incomplete or not in full quarter.

10. Generally Horden Works have not entired expectations—The following are the principal reasons why the expectations formed of the Decem works when they were first projected nearly 30 years and fore not been realised to

(i) In the early days of irritation it was accorded as an action that water was tally to be brought to the find to be used. Raperious with the black soft contry has shown that extended discovery irritation is not to be level for except in a year of sourced tought.

in the principal to degrain crops of the Becom are onto soly grown with at irrigation. There is no demand either for wheat, which is extensively grown in Parish and Aurit-West Provinces, or for rice, which is the principal professed crops in Friends and Regard.

frigition crap in critical and normal.

(bit) Any then, it was thought, would afford irrigation for thy crap. As the mens, it maters upoly is abandant, extensive dry-crap irrigation was cracked position and large areas necessitizate has irrigable in an ordering year. The areas there are given by extincted have been forelisted extensive, and the estimates have been considerable acquired within accept year.

(it) In the original estimates sufficient allorance was not rich for also prior, lechage and waste, and high duties were mainted. An examination of the working of the Mutha Cara's in 1824 showed that the date of water on that eanily had been correstimated. Similarly, enquires on other matha have regulated in large reductions in the duties originally seemed.

(v) Countrainment which and leader.—The canale mero desympt in the early days of irrigation with charle bancs. The idea was that example would keep out with. Thus has been outralisted by the experience of example the the Matha, Fland, and Januda, which are singled calculated which require large some annually to clearance with.

Sufficient allowance was not made for leakage, which always takes place in musical ground. The live ship time already referred to, in connection with the Mutta Cind in 1941 array tel the accessity of restricting origation, riller than send them water a great length where westage was out of prejection to irrigation.

Fallfelling or previous of a rore of pulle is expensive, but it had to be not rued to stops ome of the larger leaks on the Musha and Nico Canals.

(e) The croprate system induces the cultivator to raise up to the last more at the raiself before thing could water. He then takes either too med water or too little, generally too much when he can, and the count mater gas the discredit for any damage to the crep atture you an exercise or minus.

20 Dec. 01.

The formalities of the water applications and special measurements, etc., are also obstacles in the way of extension

(vil) The country being uneven, levelling and terracing are in some places exponsive, and the cultivator, unless forced by drought, does not often think it worth his while te prepars his field and the channel necessary to lead water to it.

(vii) The rain water deposits its silt in storage reservoirs, and thus loses a great deal of its fortilizing quality before it is distributed for irrigation.

(ix) Capal water is considered too cold for garden calti-

(x) Can't water is considered too garden canter ration, and well water is often preferred. (x) The Decem caltivator is heavily involved in debt. Irrigation of personnial crops requires capital and manure. Plack soil requires a liberal use of manura to fertilize it. He does not often trouble to collect manure himself, and is too poor to prichase it.

# 4.—STETEM OF ADMINISTRATION AND ITS EFFECTS ON TINANGIAL RESULTS.

31. The reasons given in the preceding section for the disappointing results on the Bombay works are based on unfavourable natural conditions and partly on the defects or incompleteness of the works themselves. It will next be considered how far the system of administration, accounts,

and assessments has operated in the same direction.

32. Reference.—Appendix VI is an anthorizative statement explaining (1) the classification of works for purposes of account and (2) the sources from which funds are

derived.

Appendix VII gives a summary of account rules and Government orders in force for regulating establishment

Sintement I-C attached to the Annual Irrigation Revenue

Statement 1-U attached to the Annual Irrigation keyonue Reports gives the main heads of rovenue and expenditure. 33. Administration of small Irrigation works.—The 36 irrigation tanks and canals in the Doctan and Gajsrat are spread over several districts. There are special Excentive Engineers for irrigation works in Khandesh, Poon, and Dharwar, but in all other districts the works are looked for the learnith and hardling and these mith several products. after along with reads, buildings and other public works by the Executive Engineer of the district concerned. On small irrigation works, he is assisted by a Pahlic Works subordicate, who may have several reads and buildings in his charge at the same time and who often has no epecial training or aptitude for irrigation work. He generally has no information on the financial results of his work. He gets instructions to debit such and such a charge to such and such a head of expenditure, according to certain rulings of the Code and the Examiner, not understood by him. If he does this and submits the usual statements on prescribed forms and sees that there is nothing vory wrong about the upkeep, his duty to the irrigation work is discharged. Except in the special irrigation divisious, the Exceptive Engineer has his hands full with other work. As severe economy is onforced in maintenauce, he finds it a struggle to ensure bare efficiency of the tenks and cannls in his charge from a professional point of view. In judging of the efficiency of management, Government take into account both increase of area and not revenue. So, it is not clear to the Executive Engineer whether the water-supply should be reserved for valuable crops which pay best or for protect-ing food crops which pay least. He might try to extend ing food erops withou pay teast. He higherly to extend irrigation by a few norce every year or eave a few hundreds by reducing expenditure; and he would persovere to do so if favourable results followed his zeal for efficiency or economy. But he finde all his efforts rendered unavailing by a system of book debits made in hie office and by the

Examiner, under which it is often impossible to show reli- Mr. M. Vivable working results.

34. Book debits under 'Interest charges'.—According to the Interest of the Interes

34. Book debits under Interest charges.—According to the Irrigation Revenue Report for 1899-1900, the total balance of interest charges on major works up to the end of that year amounted to Rs. 1,25,18,353. Under present rules, fatorest during construction for major works in progress is calculated at 3% per cent. per summ on the oatlay at the end of the previous year plus half the outlay for the year itself. Funds are provided for new works according to the financial exigencies of the Gevernment of India. The fact that the construction of a work is prolonged, ie in most cases due to this reason, rather than to the necessities of its execution. Prolonged interruption is in itself the very reverse of beneficial, but when the interruption is caused because funds are not available, or a design is not completed or approved, the accumulation of interest charges in the interval becomes a mere matter of form.

Taks for example the case of the Chankapur and Maladevi reservoirs. Both these works have been in aboyance for many years past (the Maladeri Tank work was recently re-opened for a short time as a relief work): in the one case because there were no fuads, and in the other, besides case because there were no fuads, and in the other, besides want of funds, there were doubts as to the saitability of the design. All the same interest charges are being added to the total sum-at-charge. Up to the end of 1899-1900, the work's expenditure on the Chankapar Tank was Rs. 60,495 and the interest charges in the Administration Accounts amounted to Rs. 49,608.

35. Book debits under 'Working Expenses'.—The nature of charges for maintenance and management is explained in Appendix VII. Percentage charges were made for establishment under fixed rules instead of the actual expenses under that head. Appendix VII shows that the expenses of revenue management are affected by

that the expenses of revenue management are affected by various fortuitous circametaness such as the classification of a district into Imperial or Provincial, the progress of large Capital Account works in the district, the extent of the yearly grants for other works in progress in the same executive division and so forth.

To take a specific instance, the Nasik District is classed as an Imperial Irrigation District, though the emesca as an Imperial Irrigation District, though the expenditure on Imperial Irrigation works bears a very small proportion to that on Provincial and other works. The result is that these other charges are debited with authorized perceatinges for establishment and the balance of the establishment of the whole district is written off en maste against Irrigation Major Works (working expenses) and Miner Works for which only itevanne Accounts are kept. The Excentive Engineer, Nasik District, mentioned these circumstances in a report in 1898 and quoted the following debits in his accounts for April 1897 as an instance in point:—

# Irrigation Major Works.

							Re.
Works.			,		•		44
Establishm				•			4,947
Percentage	of	establ	iabm	ent o	bargee	on	•
Capital	ontla	у .					11,243

This is, however, an extreme instance, but the fact that the rules allow of such debite shows that on some works at least real and unreal figures are mixed up so as to disguise the real quarations.

36. Effect of the accident of situation on financial results.—The following analysis of the working expenses in 1899-1900 in two districts adjoining one another shows better than any general explanation can, how the accident of the classification of the district affects working expen-

District.	Name of Work.	Capital Cost. Lakhs of Rupces.	Cost of Revenue Management plus Indirect Charges.	Total cost of mainte- nance, including Share of Establish- ment.	Total Working Expenses.
Áhmeduagar (Imperial)	Lakh Canal Ojhar Canal Bhatodi Tank	314 314 314 314	Rs. 11,097+1,640 12,035+1,765 5,878+760	Rs. 3,488 8,584 1,565	Re. 16,225 17,374 7,703
•	Total .	105	\$2,665	8,637	41,302
Sholapur (Provincial)	Mhasvad Taak Ekruk Tank Koregaou Tank Ashtı Tauk	204 131 81	4,572+700 3,584+520 . 301+49 1,039+215	7,268 5,898 376 3,055	12,640 9,502 726 4,309
	Total	43	10,980	16,097	27,077

Mr. M. Vis. All the irrigation works in the two districts are given in vessaraya, the nhove table for an impartial comparison. Ahmednagar is classed as an Impartial District and Shoinpur a Provincial 20 Dec. 01.

one, notwithstanding that the irrigation works in the latter are about four times larger than these in the former. The maintenance costs more than revenue management on every maintenance ossis more than revenue maintenance costs more than maintenance on every work in Ahmedingar. The two districts lie side by side, and there are no special characteristics in the works thomselves to account for a difference. Yot the proportion of working expenses to Capital outlay is a littin over \( \frac{1}{2} \) per cent. in Sbolapar and nearly \( 4 \) per cent. in Ahmsdangar. A comparison of the results of the year 1895-86, that is, before the familia, gives very nearly the samo percentages.

37. Percentage of working expenses on gross revenue.— The Government of India, in their annual review, compare the percentage of working expenses on gross revenua in the various provinces. The following figures are, for Major Work only, taken from the review for 1899-1900:—

				Percentage on gross revenue of				
				Cost of Revenue Management only.	Total Working Expenses.			
Bombay, Deccan,	and	Guj	arat	16·0ô	89-20

Funjsb .			•	11-20	80-80			
Madras .				10.90	20.70 .			
Bongal .	•	•	$\cdot$	26.80	77:80			

The above comparison does not show the Bombay works in an unfavourable light. If the working expenses in Bombay nre heavy, the gross revenue carned per acro is nlso high.

38. Working expenses per acrs of irrigated area.—As regards working expenses per acre, the Bombay mte is far and away the highest. The following figures refer to the year 1899-1900:—

,				Major Works only.	Major and Minor Works together.	
Bombay	, Deccar	n, an	d Gujs	arat	3.20	3:30
» North-Y		ovina	es Yes	•	0·50 1·10	0·50 1·10
Punjab			~~	•	1.10	
Modras	•	•	•	•		1.20
	•	•	•	•	0.80	0.70
Bengal	•	•	•		1.90	0.30

The rates of working expenses per acre far 1895-96 (before the famine) do not much differ from these in this table. Comparison as above by the rate per acre irrigated is also erroneous. In n year of excessive rainfall the arm irrigated will ordinarily be small, but the expense of maintenance on ascount of floods and breacher on canals will be heavy. To judge of the efficiency of maintenance, by the east per acre irrigated, in such a year will give n totally wrong idea of the year's operations.

39. Costly revenue management and cheap mainte-nance.—The direct obarges under working expenses came

under two heads (according to Statement I-C of the Annual Irrigation Revenue Report), namely,—(1) \*Revenue Management, (2) Maintenance and Ropairs.

For the purpose of comparison under these heads, two important and self-evident propositions may be laid down, namely:—(1) that the expenses of revenus management should be proportionate to the area irrigated; and (2) that the charges of maintenance should be proportionate to the magnitude of the work which is roughly represented by its Capital cost. by its Capital cost.

Under this test the results for 1898-99 compare as fol-

Province.	Cost of Revenue managsment per acre irri- gated.	Percentage of Maintenance Charges on Cupital Out- lay.
•	٠	
Bombay, Deccan, and Gajarat	1.41	0-68

Madres	0.32	1.82
Bengal	080	2-72

Some of the works in Punjab, Sind, and Madras are very Some of the works in Punjab, Sind, and Madras are very old, being nativa construction, and they have been recently improved by the Government. The capital cost of such works is not correctly represented by the outlay shown in the accounts. The high rate of revenue management in Bombay is partly doe to a comparatively larger proportion of perennial crops. Notwithstandingt hese qualifications, the nhove comparison is very important, as it establishes the fast that the revenue management is most expensive in Bambay, while the maintenance is least so. Bambay, while the maintenance is least so.

The excessive cost of revenue management is accounted for by the system of distrist administration and of book debits for establishment explained in paragraph 35.

Viewed as an ordioary Public Works question, the maintenance charges of any work are usually determined by a percentage on the original cost of the work. Works once constructed have to be maintained, whether or not they are used, in the same way that the repairs to a building are not materially diminished by the building not being occupied. Under this test the above comparison shows that the maintenance charges are really the lowest in Bombay, and do credit to the management. and do credit to the management.

In Madins, a maintenance grant of 2 per ceat, on the original cost is usually allowed for the annual upkeep of the tanks. Such an allowance would be regarded as extravagant in the Leccan.

40. System of water-rate assessments.—There is also considerable variation in the manner in which irrigation revenue is assessed and collected in the various provinces. This is explained in Appendix V, column 7, to which reference muy be made.

In Madras and Sind the water revenue is mostly consolidated with land raysnue, and accordingly the expenses of revenue inmagement are very low in these provinces (paragraph 39) The system followed in Bombay resombles that in the North-West Provinces, but while Bombay has all the disadvantages of that system, the owner's rates and the contribution from land revenue which are added to the regular water-rates in the North-West Provinces are decided to Bambay.

41. The system of accounts and assessments has been designed by the Government of India with special reference to the large irrigation works in the North-West Provinces and elsewhere. The same system is applied to the small and

<sup>&</sup>quot;Government Resolution (Bombay) No. 12 A.I.—19 of 12th January 1893, defines "Revenue Management" to mean "those duties exclusively connected with the revenue on account of irrigation water supplied to cultivators, and by which the collection of revenue in explaised. Such duties include the distribution of water, inspection and messating of crops, setting disputes as to cannot stare between irrigators, graging discharges, receiving and submitting water applications, preparing assessment, papers, etc., but are entirely independent of duties connected with the repairs or general multranee of the work which are required to render the canal efficient to perform its function of earrying the water."

soattered works in Rombay, presumably for the sake of uniformity and administrative convenience. The result is, as here shown, that while the direct useful effects are minimized, the initial cost and subsequent maintenance charges are exaggerated by a system of book debits authorized by tho

42. An enquiry into the details of maintenance charges of irrigation works in Nasik and Ahmednagar in the past will show that they are burdened with book dehits for establishmout although only a small part of the establishment is really maintained for the works. The debits arise from the situation of the works in districts which, for no concern of heirs, are classed as Imporial.

# 5 .- THUE VALUE OF THE WORKS.

43. Growth of Irrigation slow but steady in Bombay.—For reasons connected with the black soil and the absence of demand for canal water for food-grain and other common crops, the growth of irrigation on these works has been slow. Up to 1881-85 the Capital outlay invested in common crops, the growth of irrigation on these works has been slow. Up to 1881-55 the Capital outlay invested in them was 210 lakhs, and the results of that year showed an irrigated area of 30,665 acres and a net revenue of Rs. 55,090. The corresponding figures for 1899-1900 were 263 lakhs, 185536 acres, and the 3,55,665, respectively. Thus, in the course of fiften years, with an inocease in Capital outlay of only 25 per cent the area irrigated has nearly trebled, and there has been a seven-fold increase in net reserve. The increase of revenue and improvement in the revenue. The increase of revonue and improvement in the renumerative character of the works are of slow growth in Bombay, but experience shows that that growth is stoady

44. Value of irrigated crops.—The value of crops por acre irrigated is also shown in Appendix II. The Bombay crops were valued at Rs. 59 per nero in 1899-1900, while the best in the other provinces did not exceed Rs. 38 or 65 per cent, of the Lombay rate.

45. Value of the works if constructed and worked on commercial principles.—The contract charges for designing and constructing similar works in Europe would be from 5 to 10 per cert. on the outlay. In Bombay it should not exceed 12 per cent., including land charges, while on Government works, as explained in Appendix VIII, it is actually about 30 per cent. Under Government, the work is spread over a long term of years, during which a large amount is ullewed to accumulate in the simpe of interest on the nartial expenditure before the works begin to carn. Taking these and other similar circumstances into consideration, the cost of such works, if constructed by a private company or individual or on commercial principles by Government itself, would probably not be more than 76 per cent, of the capital value new charged in the accounts. per cent. of the capital value now charged in the accounts.

As regards maintenance, the private owner would be required to pay for expert advice at zaro intervals, especially in the case of minor tanks and canais. The working charges (of which at present establishment forms about 50 per cent.) would prohably be half, and the sepervision and maintenance more close and efficient.

The private owner would sell the water according to the demand for it, onhampored by nny rigid system of water-rates. He would advertise his supply and use his utmost enduavour to persuade oultivators to utilize all the water in the most profitable way to himself.

An irrigation work in the Deceau cost at present at the rate of about ks. 200 per acre of land actually irrigated (Appendix X). To a private owner and to Government itself, when the present disabilities are removed, the cost would propubly be about Rs. 120 per acre. The average yield per acre with high class cultivation may be estimated at about Rs. 65 in an ordinary year, and Rs. 85 in a famine year. The net profit would probably be Rs. 35 in the former case and Rs. 50 in the latter, or on an average, say, Rs. 40 per annum. If the owner of the irrigation work also ewood the land the net return to him would be from nlso owned the land, the net return to him would be from 20 to 40 per cent. on the capital invested.

The private owner would sell the water to the crop which pays him best. He would not reserve the water-supply for the protection of dry crops belonging to other people if his object was to carn a large return. The present peopreturns on the works are dus, among other causes, to the practice of assessing water revenue without reference to local conditions. The Executive Engineer is required to the described his lands and causes up to a cortain standard of efficiency, and whon he has done this the water may run to waste or remain locked up in the tanks for all he cares. There is no co-operation between the supplier and the purchaser. The cultivator is not bound to take the water nor the Government to give it, and in assessing water revenue, Mr. M Vis-no account is taken of the character of the season or the verturaya, market prices of the crops.

The above is a hypothetical case intended merely to 20 Dec. 01. illustrate the true value of an irrigation work. It is not of course recommended that the construction or maintenance should to my large extent be outrusted to private agencies. The Illustration is put forward to show that the tanks and causes are not constructed or worked on a com-mercial basis that the results shoold be judged too strictly on commercial principles.

46. Among other advantages of irrigation works may be mentioned the following:—

Direct and indirect benefits from irrigation .- Irrigntion works are most useful during construction as famine relief works on account of the useful employment they provide to large bedies of relief workers.

In a year of great scarcity, dry crops under command of an irrigation work are protected to the utmost capacity of the work, while unwatered lands in the neighbourhood would lie absolutely unproductive.

In good years, perennial and other valuable crops can be grown, which add to the wealth of the country. In times of varefry people can add back on the surplus of good

Loss of land revonne on the irrigable area is averted in a

No other improvement is so effective as irrigation, in an agricultural country, for keeping the oultivator to bis village and for preventing dismemberment of families and village communities on whose prosperity the regularity of the receipts on account of land revenue depends.

Irrigation works materially reduce the numbers flucking for Government aid on the appearance of a famine.

Fodder is grown for cattle and a water famine is of rare occurrence in the neighbourhood of an irrigation work.

The growth of food crops in a famine year is the irrigated areas helps to keep down prices and is indirectly of service to the neighbourhood and the whole country.

These and other advantages do not admit of direct money valuation, but they are not on that account to be ignored in criticising the value of the works to the State.

# 6 .- CONCLUSION AND RECOMMENDATIONS.

47. Most of the conclusions in this memorandum were derived by a study of the results of irrigation works before the famine. Tables were originally prepared for 1895-96. The results of 1899-1900 are marked by a large increase in the area irrigated and gross revenue everywhere, more especially in the Punjáb, North-West Provinces, and Sind, but there is no appreciable variation in the relative value of the results as affecting this enquiry.

45. The principal object of this memorandum, as already explained, is to bring into prominence the distinctive features of Bombay irrigation, so that if their existence is considered as calablished, the necessary changes in the rules and in the treatment of the works, in consonance with local and in the treatment of the works, in consonance with local conditions, may be made with a view to improve the reverence and thereby pave the way for further extension of the works. In point of financial results, Sind stands at the head of the Provincial systems or nearly so. As Sind works are officered from the same staff of Public Works Department Engineers as those of the Descan and Gujardt, it may be concluded that the comparative ill-success of the latter is not due to any lack of efficiency in the administration.

49. As was observed already, the conditions of irrigation in Sind and Punjab are very different to those in the Dec-can and Gujarat. Cultivation over large areas is imposalble in the furmer without artificial irrigation.

slble in the former without artificial irrigation.

Madras and Bembay (Deccan and Gujarat) fall under a different category. There is no great difference between the two provinces in respect of well irrigation. The percentage which the area under well irrigation bore to the total cropped area during 1899-1900 was 4.89 in Madras and 2.40 in Bombay. But in regard to canal and tank irrigation, while the percentage for Madras was roughly 19½, that for Bombay was about \$\frac{1}{2}\$ only. This great inequality is accounted for by the great demand for rice cultivation in Madras. Excluding rice, this were for Madras in 1898-1899 was 2025/10 hores under for Bombay 96,406 hores. The former, being less than two and three-querter times the latter, will appear small and even unsatisfactory when it is remembered that the relative capital outlay is more than three times, capital outlay is more than three times,

Mr. M. Tise resvaraya.

The chief reson for the inequality is the difference in sail and climate and the absence of deltaic areas in Bombay for the sultivation of rice.

50. In all provinces any large extension of irrigation is dependent on the damend for water for faod-grain crops, namely, cereals and pulsee. As a general extension of irrigation to cereals and pulsee is rendered impossible by peculiarities of soil and climate, sugarcane, and other high class crops might be oncouraged in the Deccan by a system of rulee and management specially odapted for their development.

51. It was remarked before that whils the financial results are judged in a commercial sease, the works are not administered on a commercial basis. To begin with, most of the works owe their origin to famines. They are commenced without sufficient preparation at a time of pressure. When the famine is over, either the works are kept on for a subsequent famine or completed slowly os famids allow. In the meantime, the partial outlay remains unproductive and an account of interest charges is maintained. During 1899-1900, repaire to irrigation canals and tanke were undertaken to provide work for famine labour, and in come cases the outlay incurred was heavy. The returne for the year on such works were in consequence unsatisfactory. We have seen that in come cases dehite are made for establishment not really omployed on, or required for, the works. During famine years, water is given for protecting drycreps as on the Nira Canal by withdrawing the same from high class are and, therefore, in the sacrifice of canal revenue. While both during construction and maintenance the works anheered in this way a variety of purposes of public policy and civil administration, Government should be content with a lower rate of return for the capital than the strictly commercial one. Either the financial results should not he taken as a test of success, or the works should he managed on a strictly commercial basis.

52. It most be admitted that the Bombay irrigation works will never make a neark as Productive Public Works. No large outlay on the scale of Sind or Punjah is justifiable here. The capital outlay per zero actually irrigated is about Rs. 200, the overage value of the produce will be about Rs. 70, and the grees revenue, easy, 34th of the produce or Rs. 6.5. The working expenses amount to about Rs. 3, leaving a net revenue of Rs. 35 and a net return of about 1½ per cent. on the capital outlay. If menaged with due regard to local conditions, the works can be made to pay over 2 per cent., and if constructed and managed on strictly commercial lines more than 3 per cent. The indirect advantages to the State do not admit of valuation, but there is no doubt that the State picks up in a variety of ways the full productive value of the entlay.

Successive Famine Commissions have urged the extension of irrigation works as a protective measure. During the quinquential period ending 31st March 1891, the innual outlay on now works was 5 to 10 lakis. This was reduced to one and a half lakis in 1895-96, and to less than one laki in the following year. The enbequent expenditure does not count, as it was ell, or nearly all, for famine relief.

An annual outlay of from 6 to ten lakes, or about 2 per cent. on the land revenue of the Presidency, would be a reasonable provision in this respect. This outlay would be little more than the interest on the expenditure incurred in the famine of the past two years. It would be necessary to lay down a definite policy in this respect for, say, ton years at a time.

63. Irrigation works in this Presidency have a limited protective value. The tanks on the plains de not generally fill in a year of dreaght. When the ruinfall is good, the crope are good also, and there is no demend for water except for a limited clase of crops. The Nira Casal is developing into an ideal protective work, because the storage reservoir has a ghat catchment, the cupply from which never fails. The canal supplies a tract where the rainfall fails frequently and is almost always defective. Areas in other parts of the Decean which lend themselves to the construction of such worke should receive the first consideration. The experience of the writer on the Nira Canal is that, if managed with an eye to revenue, the work can be made to give a return of over three per cent. Onring 1900, the cultivators were consulted as to their willingness to hind themselves to take water for selected areas for fixed periads of 5 or 6 years. There was a very ready response. Applications were received for about 18,000 notes in the upper half of the canal. They were willing to pay Rs. 10 per acre, and to bind themselves not to grow sugarcane or other orops, requiring a supply in the het

weather, except on a fraction of the area. At present, the productive value of the work is marred by the exigeucies of protection in seasons of drought, and water cannot be given entirely for crops which pay the highest water-rate and for which there is demand.

54. A "Productive Work" is also largely "Protestive." If n work is managed so as to get the heat return from it every year, not meraly us a reserve for the protection of ordinary crops in seasons of drought, the wealth produced in normal seasons will belp to mitigate distress in times of searcity.

## Practical Recommendations.

55. A number of recommendations and suggestions will now be submitted us a logical sequence to the foregoing enquiry to indicate in what directions improvements are necessary and possible. One of the objects in putting these forward is to reconcile the protective with the remunerative character of the works. The suggestions themselves are doubtless expuble of considerable modification and development when the difficulties and objections likely to be raised are met, and the expert knowledge of Revenue and Account officers is brought to bear on them.

(1) It would seem desirable to lay down n definito pelicy to be followed without heetation for n period of, say, ten years at n time, and to decids on a meximum average expenditure of Rs. 8 to 10 lakhs annuelly on irrigation works in the Docean and Gujarat. A larger sum than this may he spent on works, if any euch nro found, on which the outlar is directly productive. There should be no sudden changes of policy.

ba no sudden changes of policy.

(2) If Government decide upon further extension of irrigation works and u liboral expenditute of money on the scale suggested, an officer of the rank of Executive Engineer, let grade, or of Superintending Engineer may be attached to the Scoretariat. Ho will work as a personal assistant to the Chief Engineer, collect technical information for Government, investigate projects, which progress and maintain a continuity of policy both as regards construction and maintenance. Such an officer would be very usoful, especially if he looks upon himself as a helper and adviser rather than as a critic of Superintending and Executive Engineers, and he is not burdened with heavy office Work.

(5) The coestruction of small village tanke and river weirs may be encoeraged, and an expenditare of Rs. 2 to 3 lakks from Provheial Fands set apart annually for the purpose. Small tanks will store water in flood time and give out during a break. They will maintain the subsoil water at a high level in the neighbourheod. Well irrigation might be encouraged in combination with small tanks. Where cook would fait without the other, the two together might be mutually helpful and justify the outlay. (This suggestion is, however, cetside the scope of this enquiry as it relates to works for which Capital Accounts are not kept.)

(4) On lang canals it is not usually possible to supply water throughout the year for percanal irrigation towards the tail. On the Mutha Canal, for instance, water is given for engarane and other perennial crops dependent on wells in the lower reaches during the monsoon only, in the middle reaches for eight months, and in the upper reaches where they are not so dependent throughout the year. In a similar way well irrigation may be systematically encouraged in such lecalities to the mutual benefit of the cultivators and of canal revenue.

(5) There is a number of small tanks costing Rs. 2 lakhs or less included under "Minor Works and Navigation" in the Bombay list, which might be handed over to the Civil Department for maintenauce. The capital outlay on them may be written off against the Surphue Imperial Irrigation Rovennes. Such small works are not maintained by the Public Works Department in other provinces even as Provincial Works. Important repairs might be carried out by the Public Works Department staff, as is at present done on the second clees irrigation works in Khandesh, Nasik, and elsewhere. An arrangement may also be made for a periodical inspection and roport on these works by an expert to onsure that nothing very wrong in the manegement is allowed to occur.

(6) Large tooks should be constructed, as far as possible, in preference to small ones where a olioioe exists, and preforence should be given to streame having ghat catchments. In the case of small tanks (Capital Account Works also), the exervation of wells below them should be encouraged to make the two mutually helpful.

- (7) Levels may be taken, and a careful survey made of (7) Levels may be taken, and a careful survey made of the various districts to see if any very large schemes are passible. An ideal protective work would be our comprising a storage reservoir with a ghat catchment and unfailing rainfall, and a long canal or canals like, the Nira which will carry to supply to plains where the rainfall is scanty and uncertain. The country should be surveyed to see where such schemes are passible, and the most feasible and profitable of these taken in hand first. Sach canals hard a sheave affarding protection to the monsoon craps besides always afferding protection to the monsoon craps irrigate a large area of rabi secording to the supply stored.
- (8) Very large canals may be taken from rivors with ghat catchments to the arid pleins in Shelapur, Ragar, and Bijapur and other districts where possible. Such canals may fill depressions and small tanks along their course, and irrigation may be practised from small tanks, pools, etc., instead of direct from the canal. Irrigation direct from the canal by inandation might also be attempted. In a broken country cross drainage would be costly, but all small makes might be intercepted with enitable eventless weirs. Such canals may be used in a sense as able overflow weirs. Such canals may be used in a sense as inundation canals. They will distribute moisture over a large area in a season of drought and will help well irrigation as well.

(B) At present, only about a third part of the area classed as annually irrigable, is actually irrigated in ordiarry years. The works have been constructed at much expense, but the cultivator is not bound to use the water, expense, but the cultivator is not bound to use the water, oven though his land may benefit by it. In a year of ecarcity, Government may not be willing to give water for perennial cropy. This uncertainty and want of touch between demand and supply has a large moral effect in retarding development. It is astonishing how carefully water is utilised on second class irrigation works in Nasik and Khandesh whare a consolidated rate is levied. The water-supply on many of those warks is precarious, but as the cultivators are obliged to pay for a fixed area, whether or not it is watered, they are careful to take the atmost advantage of the supply available. As it is found that the same area cannot profitably grow perennial or other valueable crops in successive years, they have adopted a system of crop rotation, according to local circumstances, by changing the crops and the intervals at which they are shawn.

The old works furnish an analogy as to what might be done with advantage on the new works. The future success of the latter depends on some each arrangement as the following :-

- In a number of villages under command ucarest the head works from \$ to \$ of the total culturable area might he classed as a that or irrigated area, and a fixed water-rate put an it for a term of, say, six years. This area will bave the first claim on the water-supply during that period. The tatal extent of this fixed irri-gation should be, say, about one-third the area that the tank or canal can permanently irrigate.
- The remeining water-supply should be ased in ordinary years for growing high class crops and doring years of scarcity or famina for the protection of dry-crops. There will thus be three classes of irrigation, namely,—(1) the fixed, (2) the permissible, and (3) the dry-crop. The rate for permissible irrigation should be a self-similar low to cover the loss covering and her the rate for permission triggetor should be sufficiently low to cover the loss occasioned by the interruption of high class cultivation and the divorsion of water-supply for the use of the dry crops when the accurrence of a drought renders it necessary.
- This arrangement will ensure about two thirds of the water-supply being made available for perennial or other valuable crops in all ordinary years, and the same quantity for food-crops in a year of scarcity.
- In the second division, the area of permissible irrigation, the cultivators should be encouraged to construct walls (by takavi advances if necessary) to supplement the canal supply at times of deficiency, or to fall back upon when the canal supply is stopped or diverted to save the dry crops. The precise of supplementing the good supply from wells is one largely followed on irrigation works in all parts of India with most eucoaraging results.

In those years in which the water-supply is diverted Mr. M. Vie-for food-crops, the water-rate on the permissible Mr. M. Vie-nrea should be partially remitted seconding to ofreumstances.

- Where no hardship is liable to be caused, the assessment on dry-crops irrigated should, as far as possible, be on a full area of the field, so that no measurements may be necessary.
- In order that the majority of the cultivators of a village might participate in "fixed" irrigation, an arrangement might become to by which the irrigable land is shared by nearly all the people of a village by the lease of plots for the period for which the area is classed as irrigable. The ners may be fixed after the cultivators come to an understanding among themselves in this respect. Government will forego the liberty of raising the water-rates at pleasure, but the possible loss of revenue will be very small com-pared with the improved receipts arising from fixity of irrigation.
- The works under this arrangement will be protective in a year of scarcity and pradnetive in all ordi-nary years. It will also lead to the concen-tration of irrigation and saving is expense on distributary channels.
- (10) The crop rate assessment with its attendant formalities is a combrous and costly process for small works especially. It should be gradually changed into a consolidated rate on as many works as possible. Under the smaller works, areas which can be conveniently irrigated overy gent may be classed as permanent bajuyat and a fixed canal water-rate levice on them for a period of, say, ten years at a time. Rules for the equitable distribution of water under all the varying conditions of supply might be leid them for the equitable of the prior of the same of the prior of the same of the prior of the be laid down for the guidance of the villago Paach. A epecial officer may give advice and control such cases. The consolidated revenue will tend to greater permanency of irrigation and will save a large amount of unprofitable work to the Public Works Department.
- (11) If the annual returns are to represent the actual transactions and to be a guide to future improvement, such arbitrary debits as these describe in paragraphs 35 and 36 ought to be impassible. The account rules may work very well on large irrigation systems where, owing to the ranguitude of the revenue operations, the burden of establishment is not folt. The Bombay works are so small and the revenue aperations on such a limited scala that even the pay of the subordinate in charge often counts. If the same official is on a work for a long time, the revenue diamnishes as he receives promotion and his salary increases. The remady lies is a new grouping of works and in a re-adjustment of the establishment employed eccording to actual requirements. The Executive Divisions are created for civil works and servo a variety of administrative purposes and, bearing this in mind, each work and service should be debited with a praportionate share of the cost of establishment according to the service rendered. It the charges are in any year excessive, no single work or service should be made the scape-goat. The excess should be debited to, or distributed over, all the warks and services. In that case, the evil will soon be cleared itself and find its own remedy.
- (12) In the case of the emailer works, only the dams and masory works of exceptional importance shoold be in charge of the Public Works Department. The channels should be left to be maintained by the cultivators under the supervision and guarantee of the Revenae Department. Such repairs as cannot be effected by the caltivators themselves, should be attended to periodically by the Public Works Department, as on the second class irrigation works at present.
- (13) For improved administration, a number of works, say, 15 or 20, should be formed into one group on which trained minor officials could be interchanged.

The subordinates of the Public Works Department chould be offered higher rates of travelling allowance in view of the difficulties of travelling in tracts imperfectly supplied with communications. This will also act as an inducement to them to remain on and take an interest in irrigation works.

(14) Irrigation projects should be prepared after a systematic examination, along their whole course of the nalas or rivers where such works would be useful. In the past, projects have received attention chiefly an the occurrence

Mr. M. Vis. of a famine or aente distress. If Government are prerescaraya. viously prepared, it will obvinte the rick of their committing themselves to unsound or imperfectly prepared projects 20 Dec. 01. which bring discredit on the whole system.

(15) A thorough inspection should be made of every irrigation work at fixed intervals of 6 to 9 years and a short report published with the proposed triennial Irrigation Revenne Report at such intervals. A knowledge of the history, defects and wants of a work, which such a report would furnish, will add greatly to the efficiency of maintenance. Such information can only be collected at present hy leborious search into old records which few officers have the time or opportunity to make. Unless a work is thus periodically examined and a programmo of treatment laid down, annual repairs, such as silt clearance and maintsnance of drainage works tending to the permanent efficiency of the works, are liable to be neglected and the establishment will be tempted to seek cheap credit for economy by miximising or postponing such repairs.

56. The system of design and management of irrigation works still followed is essentially on the lines projected more than 15 years ago when the office of the Chief Engioeer for Irrigation was sholished, and the strength of the special staff reduced. Enough is now known of the result of that system and the conditions under which only irrigation can be practised with any degree of success in the Decean. The sanguine expectations in regard to functional results originally entertained have not been realized. The time is now ripe for a study of the ficancial and other results on these works, with a view to determine the precise limits within which further oxtension is desirable and to arrive at a definite policy to be followed in regard to them in the future. It might then he decided how many and what classes of works started in the recent famine should he taken in hand and in what order and at what rate of progress they are to be carried to completion. There is a very large area in the Decean where the rainfall is uncertain and distress frequent to which the protection which irrigetion works can give would come as a great hoon.

# APPENDIX V.

Statement showing physical conditions, local psculiarities of Irrigation and sources of Irrigation Revenus, etc., in the various Provinces.

Mr. M. Visvesvarayo.

20 Dec. 01.

No.	Province.	Donsity of popula- tion per square mile.	irrigated arous.	Source of Water-supply.	Local peonitarities of Cultivation and Irrigation.	Sources of Irrigation Bevenue and manner of Assessment.
1	5	3	4	5	6	7
1	Bombay, Dec- can and Gujarat.	207	20 to 26	The water-supply is from tanks and small rivers or from a combination of hoth. The rivers not being recently practised from them without the sid of storage reservoirs.	The country is runged and broken. There being no perendial streams in tracts suited for irrigation, large canal systems, soch as are found in Northern India, are not presible. The works most necessarily be small and scattered.  Irrigation in Bombay is not carried on by the diversion of snow-fod or spring-fed rivers as in Northern or Southern India. Except on some minor streams water has to be collected in costly tanks and taken in canals which run over broken country requiring expensive cross drainage works.  The black soil which prependerates in the Decem passesses the pecularity of resisting evaporations and is unsuited for the irrigation of crops ordinarily grown by rainfall.	aro not enpplomented by "Owner's "rates as in the North-West Provinces, nor by a sharo of land rovonno.
C)	Sind (Dombay)	,	Below 5 Inchos.	Irrigation is chiefly by inundation canals from the Indus. The supply in the river though abundant in all seasons is apocally large in the khariftseason when the Indus floods rise to a sufficient height to command a large tract of country.	Chittvation without artificial irriga- tion is practically unnexistent in Sind. The annual inusulation brings in a lot of silt which fertil- ires the seil.  Till recently irrigation was largely dependent on the character of the inaudation in each year. The works now in progress ore intend-	canal consists al- most entirely of share of land rov- cane which is divided in the ratio of 90 per cent. to irrigation and 10 per cent. to
3	North-Wood	406	21 ta 40		other principal crops which benefit by irrigation are grown during the cold season when the rivers are at their lowest.  There are only five major works in the North-West Provinces, the largest of them being the Ganges canal completed in 1854. Though fine in number the canal systems are very large and continuous.  The country has a gradual slope of from a foot to 18 inches per mile. In favourable seasons food crops can be raised without the aid of artificial irrigation is available artificial irrigation is available.	ansosacd partly on the occupior and partly on the owner of the land, the bulk of the rates feding on the former. The receipts are further increased by a not unimperiant coatri bation from land revenue.
4	Panjab .	180	13 to 17	The rainfull is ordinarily insufficient for cultivation, and irrigation is either from percunial rivers like the Jumna or from innutation canals (as in Find) from the river Indus and its tributation,	south are simillar to these in Sind; in goods! Punjab resembles the North-West Provinces with which it is contiguous.	rate assessment i
	Madras ,		25 to 50	Irrigation is earried on a large scale on the river deltas where the mater-amply is percaniel; nice by a large number of tanks, mosting of old untive another them.	is mainly one of rice entitation. Over \$0 per cent, of the Irrigated crops is rice. On most systems only one crep is raised in a year and this is irrigated in the miny season when the rivers are in flood. Irrigation works are of great importance here as they are also used by necessary for secoring a barves of rice in all years, specially good harvests. In the delitals areas the use of water begins in the immediate vicinity of the dam or weir. Comparatively simple works are sufficient for irrigation. The difference of level between the river and the country is to light that a modernate height of dam suffices to lift the	gation rorenne is evilenced, and or most of the work is consolidated with the land rovenue.
G	Pengai .	471	49 tn 50	Irrigation is from per- ennial rivers like the Mahanadi and the Stue,	water into the irrigation channels. The Gauges delta is very favourable for irrigation, but the rainfali	System of assessment and a series of assessment Bomlar (De can and Quincat).

## APPENDIX VI.

Note on the classification of Irrigation Works for fur-

Reference:-Government of India Resolution No. 177 -I., dated 26th July 1892.

For purposes of account, irrigotion works are divided into two main classes; Major and Minor.

Major works again are sobdivided into-

- (a) Productive works, which torm is applied to projects that are estimated within ten years after completion to yield a return of at least 4 per cent. on the sum-at-charge, i.e., the direct and indirect Capital outlay plus the accumulated arrears of sin'ple interest.
- (b) Protective works which do not necessarily fulfit the above condition, but nro undertoken in order to protect certain tracts fram famino.

Miner works of irrigation are again subdivided into-

- (a) Those for which Capital and Revenue Accounts are kept.
- (b) Those for which only Revenue Accounts are kept.
   (c) Those for which neither Copital nor Revenue Ассорть вто керт.

Agricultural works, which term is applied chiefly to river embankments, are included among Minor works and are subdivided in the same manner.

2. Funds for Capital outlay on Major works are at Pra-sent provided in all cases from Imperial resources.

In the case of Productive works, the capital outlof is principally from borrowed money. This is supplemented by grants from Imperial reconness out of the sam set saide annually for famine Protection and Insurance. The Recense outlay on these works is also imperial, except in Beugal and the North-West Provinces, where it is Provinced.

For Protective works the capital entity also comes out of the provision for famine Protection and Insurance, the charges on the Revenue Account heing also Imperial.

In the case of Minor works, the Capital outlay is from Imperiol Revenues in Rajputana, Baluchistan Upper Burns, Bombay (except the Gokak Storage Works) and the Pupjab. In Lower Burns, Bengal, the North-West Provinces, and Madras it is Provincial. The Revenue untilny follows the same division. samo division.

3. Receipts on Revenue Account are of two kinds-Direct and Indirect.

Direct recoipts consist principally of the occupier's or water-rate levied on irrigated lands and of the number's rates on the rome land, the assessments being made as a rule by the Public Works Department, but the recipits realized in the Recease Department. They also include realizations on necount of the sale of water for sondry the receipts for the rate return of the rate of water for sondry for the rate of purposes, for the water-supply of tawer, from plantations and other casal produce and fer water power, navigation receipts, rents of huildings, fines and miscellaneous, which are all realized by the Public Works Department. Direct receipts are oredued to Imperial or Provincial in the same way as the Rorenne onthay is debited. way as the Rorenne ontlay is debited.

Indirect receipts are realized in the Revenue Department and consist of the share of the enhanced land revenue due to and consist of the share of the enhanced land revenue due to irrigotion, or, in other words, a portion of the increased land assessment that is levied on land brought under the command of an irrigation work. In the case of all Major works these receipts are credited to the works in the Finance and levenue Accounts. In some provinces, however, and notably in Madras, the water-rates though separately ossessed ore collected with the land revenue and in the case of those works for which Capital and Revenue Accounts. In the case, however, of all Minor works, no credit is

In the case, however, of all Minor works, no credit is afforded on account of these indirect receipts, which are included in the general land revenue.

Indirect receipts are credited to Imperial in all cases, a proportion of the total lend receipts being assigned as the Provincial above under the contract system.

As regards expenditure, the Finance Accounts show all direct charges for both classes of works, but not the indirect charges on account of capitalization of abatements of land revenue and of leave and pension allowances.

# APPENDIX VII.

Summary of Account Rules in force for regulating Establishment and other charges.

Public Works Department Code, Volume II, Chapter XIV, 2119.—When one fund or one branch of the department oxecutes work for anothor, the charges for Establishment and Tools and Plant will be regulated under the fellowing rules:—

Establishment.—The charge will be colonlated at the rate of 23 per cent. on the author on Works and Repoirs (excluding certain items specified in clause IX of rule) plus 5 per cent. on the revenue realized from Civil or Muhtary Works and 10 per cent. on all direct revenue realized from irrigation Works.

Special Revenue Establishment .- Where a separate Establishment is entertained for the collection and management of Irrigation Revenue, the whole cost of that Establishment will be debited to the fund concerned instead of the 10 per cent. charge referred to in the preceding

Distribution of charges within Provincial and Local Branches of a Province.—When the establishments are Provincial or Local, the Local Government or Administration may apportion the charges for Establishment and Taubannia Pranta between Provincial and Local Civil Works in each apportion as your less considered desirable. in such proportion as may be considered desirable.

2. Public Works Department Code, Volume II. Chapter XIV, 2120.—The establishment charges in the executive divisions of the Irrigation Branch should be apportioned between the several classes of works carried out in thuse divisions under the following rules:—

an energes for Establishment arising in executive divisions in which only Capitol works ore in progress and all charges for Superintending Engineers and their officers employed whally in superintending Capital works will be debited monthly to Capital. (a) All charges for Establishment arising in executivo

Capital.

(b) In divisions where both Capital and Rerenace on they is being incurred, the charge to Capital for Countraction Establishment will be made month by month at 18 per ceut, on the ontay on Works and Repairs, the balance of the charge for Establishment after deducting the sum charged to service heads, other than Irrigation, toing debited monthly to the Revenue Accounts.

(c) In the case of mixed divisions primarily kept up for maintenance purposes, in which—

(1) noting on Capital works;

(2) ontlay on works for which neither Capital not Revenue Accounts are kept;

(3) Revenue outlay on works for which Capital and

(3) Revenue outlay on works for which Capital and Revenue Accounts are kept;

(4) Bercauo ontlay on works for which Revenue Accounts only are kept;

are all in progress, the debit for establishment to the let and 2nd of these classes of works will be in accord-nues with the preceding rule, the balance of the charge after deducting the sum charged to Major heads other than Major Irrigation leads being divided between (i) and (4) in proportion to outlay.

(d) In the case of a mixed division in which the outthe case of a mixed division in which the out-lay on Capital works is so large that it may be fairly considered that the division is kept up primarily for Capital works, the charge to the Revenue Account for establishment will be regulated in accordance with Bules II and III, the bulancoul the charge after dedocting the sum charged to Major heads other than Irriga-tion Mojor heads being debited to Capital.

8. The Government Resolution quoted in the margin Government Resolution No. 283. indicates the noture and A.1.—1803. dated 18th December extent of the spplication of 1836.

the code rules in the twn preceding paragraphs to outlay incurred on Works and Repairs in this Psesidency.

The charge is 23 per cent, divided as under-

Administration (Scoretarist und Accounts) . 21 per cent. Saperintending Engineer . Construction (Executive Engineer and Establishment) 21 12 18 Total 23

The Secretarist is Provincial; so 21 per cent. of the Establishment clarges on Imperial Irrication Works is invariably crodited to Provincial Establishment.

The remaining EO; per reat, is credited to In perial Irrigation Reisslichment if both the division and district are Imperial. If one of these is Provincial and other Imperial, oredits out of 20% per cent, are made to the fault concurred, for the division at 2; and for district at 15 per cent.

- 4. The marginal Government Resolution explains the sirrengent Restent Bo. 12 charges debitable to Reve-2.1,-30, 2003 12th January 1903. muo Account.
- (1) Charge at preceiving rates.—This is a percentage on expendance and provides for the executive and subordinate establishment couplaged on maintenance and repairs.
- (2) Store of subordinate establishment employed on resenue management.—This is on account of the time spent on the duties of resume management by the subordinate c-tablishment.
- (3) Special Receips Establishment.—This is establishment such as measurers, patlatics, etc., specially employed in connection with the revenue management.

- (4) Direction elarger This is either a class of artist 3fe, 2 Viccost or a percentage on expenditure to ever the cost of exercises. Chief or Seperintending Engineer and a percentage charge for Sepretariat and accounts.
- (5) Collection charges.—This is a percentage on the terrome which is ere lited to the Revenue Illepartment and deblied to the work on account of the collection of revcane by Reverue officiale.
- 5. The Goremman: Resolutions noted in the margin A 1.—11. dated the test that the rather of the A 1.—11. dated in Frinary is a collection of resemble that the first of the charges for assessment and a 1.—14. dated in March 1944.

  Receive officials, referred to in clause 5 of the providing paragraph.

The charge for collection only ca 5 per cent. ierigeta n norke is.

For lands watered in Native States. The charge for collection only is. 7 per cent. The same including measurement when the latter is not made by . 10

the Irrigation Department

Mr. M. Vis. Note on Establishment Charges prepared by Mr. Beale, vesvaraya.

Superintending Engineer on special Duty, for the information of the Irrigation Commission, 1901-20 Dec. 01.

Mr. Visvesyaraya'o momorandum of November 1901, referred to in the Report, contoios a note on the classification of Irrigation Works (Appendix VI) and a onlongry of Account Rules for regulating Establishment and other Chorges (Appendix VII).

The following remarks may be found useful :-

In Government of Indio, Public Works Department Resolution No. 869—C W. I., dated 26th July 1901, the Irrigation in India in 1899-1900 was reviewed. (Republished in the Bombay Government Gazette of 31st July Hehed in the Bombay Government Gazetts of 31st July 1901). In this roviow it was shown that the Mojor Productive Works for all Iudia have been constructed from Loan Funds, and from Revenne in the proportion of cloud 5 to 1, while the other works: Major Protective, and all Minor, ere constructed from Revenne. In Bombay the Minor Works for which only Revenue Accounts are kept are termed 2nd Class Irrigation Works. As regards Minor Works for which noither Capital nor Revenne Accounts ore kept (Agricultural Works) they are apparently of most importance in Modros. It is stated at the sod of paragraph 18 of the revinew: "Important as ere those works in the aggregate it is hardly possible to determine whot shore of the revonue dependent on them is due to the expenditure incourted by Government on their upto the expenditure incurred by Government on their up-keep, and on this account cootinuous Revenue Accounts have not been mointoined."

In Appendix VII of Mr. Visvesvaraya's memorandum, aragraph 3, the following may be substituted for the paragraph 8

A Provincial district carrying out Irrigation Works charges 23 per cent., provided the Superintending Engineer belongs to the Provinsial Establishment. If he belongs to Imperial Establishment (as in the Control Division) the chargo is only 201 per cent.

An Irrigation district carrying out Provincial Works charges only 18 per cent., provided the Superintending Engineer helongs to the Provincial Fatablishment. If he belongs to the Imperial Establishment, the charge is 203

For further details reference may be made to Government Resolution No. 1903, dated 14th December 1894, quoted in the margin.

The Secretary to Government of India, Poblic Works Deportment, No. 98-A. 1. of 17th August 1834, concurred with the views expressed by the Government of Bombay as follows :--

Bombay Government Resolution No. 66-A.1.—229 of 1884, dated 26th May 1884, convoluted two rules—

(1) the costs of all establishments employed primarily

- for purposes of Rovenuo Maintenance should be debited to Revenuo Maintenance;
- (2) concerning division of chorges on other establishment debitable to Rovenue Account:

In Sind (except in a few cases where special establishment has been engaged for Ravenuo Management), the whole Public Works Establishment under Direction and Executive should be debited to Maintenance, as the Department is not concerned with assessment and collection of

Similarly in a few cases in Gujarat and Descan where bimilarly in a few cases in Chiparat and Depean where the Revenue Management still rests with the people, or the Revenue Department. But for new works, 25 per cent, on the cetual outlay should be charged for Establishment on Mointennuse and Repairs and the balance debited to Revenue Management.

The charges for collection by Civil officers are as follows :-

- (1) Works fur which the essessment papers are pre-pured by Public Works officers, but collection is made by Civil officers—5 per cent. on reclizotious.
- (2) Works for which assessments and realizations are made by Civil offisers-10 per cent. on realizations.

The charges for collection by Jagirdars is 7 per cent. if Jegirdars make collections only, and 10 per cent. if measurements for ossessment are also made by them.

Note.—In the case of the Ashti Tank in Shelspur an nllowance is regularly paid in cash to Jegirdars by this Department for collection of the assessment of Public Works officers. The amount collected is therefore, deducted from the total revenue realized when calculating the eollection charges to this project.

Some percentages are quoted in the necompanying statement, celsuloted from the figures given in the "Abstract of Expenditure" on the various classes of works for Bombay, for the year 1899-1900.

The charges ere oil authorized by Public Worke Rules, and where the percentages appear wrong the matter depends apon some detail of expenditure, on which the proportion is different.

The 18 per cent. E-toblishment Charges abown against cach district is the Executive E-tablishment only. Under "Exoniner's Auxiliary Accounts" the 6 per cent. charges are made for S. E., Secretariat and Accounts. Expenditure on land compensation and similar things are crempted from Establishment Charges—vide Pablic Works Code, Velume II, paragraph 2119, Bule IX. When such expenditure is incorred, the percentage figures will be affected.

Sometimes there is a charge for Establishment and no expenditure shown. This is, because Imperial Irrigation Distriots charge 12 per cent. to "Incorporated" and "Excluded" Local Funds and the remaining 11 per cent. to Provincial Civil Works on account of outlay carried out from both Local Funds. This also explains the excess over 18 per cent. in Nasik and Nager. There is also an charge of 5 per cent. on Provincial Revenue in Nagar and and Assik.

### Examples :-

Mr. M. Vis- 1. Q. (The President.) You are the Executive Engineer vesvaraya. for Irrigution, Posos ?—Yes. Mr. M. Vis-

- 20 Dec. 01. 2. Q How long have you held that position?—For two years and eight months.
  - 3: Q. Where were you previous to that ?—I was utinched to the office of the Superintending Engioeer, Central
  - 4. Q. What are your duties here?—I have charge of the Mutha and Nira Caaula including their storage reservoirs, four small tenks, two or three famino works, and the woter-aupply of Poonu and Kirkee cantonments.
  - the wotor-supply of Poonu and Kirkee cantonmonts.

    5. Q. You say, "The cultorable area commanded by the works is 289,981 neres or uboat 12 per coat. of the total calturable area of the district. There is room for further extension, especially in the northere half of the district." How much do you estimate of the culturable area is notually calturated every year?—Nearly the whole area is calturated; the cultivation by means of irrigation is, however, only about 60,000 axes. The rest is ou rainfall.
  - 6. Q. You say there is room for further oriension, especially in the northorn half of the distrist—what extension do you contemplate?—There are a number of small rivers on which resorvoirs may be hold. In the north-eastern portion of the district, irrigation might be practised from storage reservoirs, esnetructed near the ghits. The whole area would want a systematic examples. inntion.
  - 7. Q. With reference to what you say about there being room for further extension, is that from personal knowledge?—No, not entirely; that is my general impression formed in my tours in the northern part of the district. No surroys have been made except o very long time ago; probably about 25 years ugo.
  - 8. Q. You say in yoar note, "the reason of more favourable results in this district is that large storage works, which luve an unfailing ghât sapply hure been constructed in combination with canals which reach down to tracts of scanty or ancertain rainfall." You refer here to the Kharakwaslo?—Yes und the Nira Canal also.
  - 9. Q. Do you know whether in this district any other surreys bore been made?—We have recently made surveys in the river valleys in four places. Mr. Bealo has the results of the preliminary surveys. We have prepared rough estimates for works costing about 60 lakks of rupees.
  - 10. Q. What manner of works are these?—Three out of the four are works of n productive nature; that is, they would be worked for growing high-class crops.
  - . 11. Q. Do they depend on reservoirs ?- Yes.
  - 12. Q. Where ure they ?-On the Pauna and the Motha rivers in the ghat region and the Kara river on the plains.
  - 13. Q. These projects are to strengthen the Mutha Canal? -Partly; two of them are intended for that purpose.
  - 14. Q. What is the discharge on the Muthu Canal?—It is not more than 250 cubic feet per second; we propose to increase it to shout 500 cubic feet per second.
  - 15. Q. What is the discharge from the NirnF-About 450 cubic feet per second; we propose to increase it to over 700.
  - 16. Q. Then you have not a general scheme for the whole district.—No; there is a let to be surveyed before a general scheme can be formulated.
  - 17. Q. Do you find the people on the Nira Const ready to take water always?—They are ready now. Before 1878, there was more water than there was demand for. That was due to sufficiency of minfall; we may be returning to the same state of things again. If there is a good rainfall there will not be much demand for dry crop irrigation. On the Much Const we have not account of the const we have not seen the same state. the Mutha Caual we have no water to give for rabi crops.
  - 18. Q. If there is good rainfall, say up to the end of September, then you would start the rabi crops ?—Yes.
  - 19. Q. Without irrigation P—They almost always sow on rain, except io a year of drought. They wait for rain. If the raiofall is insufficient they ask for cand water. In one year out of three they get enough rain for a fair
    - 20. Q. When !- From September to November.
  - 21. Q. (Mr. Muir-Mackenzie.)-Is it necessary to get the November rains in order to get a good orop?—Yes, or at least at the end of Ostobor. If the later rain fails, they require water from the esnal.

- 22. Q. Without the water could they not get any crop?— That depends on the character of the rainfall. If the quantity or distribution of rain be insufficient or unsatis-fuctory, the crop will be very inferior.
- 23. Q. In a good year you woold reckon on the October rainfall ? Yes.
- 24. Q. The later the rainfall the better the crop?— Early rain is ulso accessary for acwing. If the late rains fail, they always use eacal water.
- 25. Q. (The President.)—You say, "Where there is obrouse desciency of rainfall thore is demand for water overy year on black soil also?"—Yes, in the eastern parts of this district.
- 26. Q. Do you mean even in ordinary years?—Yes; under the small tanks in the eastern or dry parts of this district, there is a demand for water in the rabi season every year.
- 27. Q. Although it is black seil?—Yes, if they get good rain they prefer to raise the crops on minfall; otherwise they fall back on the canal.
- 28. Q. You say it is no disadvantage to have black soil where the water-supply is perennial, you mean for sagaresue?—Yss and even for dry crops in the drier tracts.
- 20. Q. Do they grow sugarcano freely?-Yes, but the black seil wants a lot of manure.
- SO. Q. You say, "the rivers and streams in the northern part of the district are suited for extension of irrigation to that region." You know the soil in the northern part?— Yes; it is lighter than io the south.
- 31. Q. Therefore it will take irrigation more freely ?-
- 32. Q. Is there any proposal for u survey P-A long time ago surveys were made, but when they took up the Nira, they probably thought they had done enough for the district.
  - 88. Q. There are no Provincial Works ?-No. None.
- 31. Q. Have the villagers never been in the habit of making irrigation tanks ?—Not in recent years.
- 35. Q. There are no rains of old tanks?—Those are some small tanks used for water-supply or washing, by men
- 36. Q. In some parts of the Bembay Presidency there are tanks in every village?—That is not the case here.
- 37. Q. (Mr. Muir-Mackenzie.)—Havo yon served iu Gojarat?—Yes. I was in Surat.
- 38. Q. (The President.)—Comparing the soil here and in Gajarat, I suppose there is more black soil there than here?—Yes, but the soil here does not crack as in Gajarat.
- 30. Q. Do you know anything of the Tapti valley scheme?—I have heard of it. I think a scheme of that magnitude should be given a trial notwithstanding the black soil. No chance has been given for such works in Gujarat yet, on a large scale. I do not eeo why we should not construct a large casul.
- 40. Q. You say, "enquiries show that doring the drought of 1809-1901 the water-supply of wells rau short. Do you know how long it took to rue short, did it begin to break down in the first dry year?—I think it first broke down ut the oud of 1899 or beginning of 1800. I was not here in 1896; 1897 and 1898 were fuirly good years.
- 41. Q. Have you ever thought as to whether it was necessary to require applications to he made overy year for water. Is at not n discouragement to the outlivator to go through all the necessary formalizies?—In the case of the small tanks I think water applications should be dipensed with; on large canals, this cannot be done. It the mensoon we stretch a point and ullow oultivators to take water. There is a Government Resolution which permits the watering of dry crop in the measoon before accepting water applications.
- 42. Q. Is there any use in the application system ?— It is of great use after the monsoon, for dry weather and percunial crops, whou the water-supply is limited.
- 43 Q. What advantage do you attach to it ?—It prevents our necepting responsibility for watering u larger area than there is water for. We have to calculate for what area we can give water. We cannot promite un indefinite amount. We usually determine the supply available in November after the mouseen and no find out for what area we cau give water and restrict the applications accordingly. At the end of the meason we have a certain another of storage in the tanks which can irrigate a cartain limited

area only. If everybody were allowed to take water, the water-supply would run out in the middle of the season and the crops would suffer.

- 44. Q. What are you afraid of if you give up the system?—For instance on the Mutha Canal we have about 8,000 million cubic feet of water ordinarily. The storage varies. If the later mensoon rains fail, wholly or partly, this storage is drawn upon earlier in the season, and there is the further disadvantage that the normal flow in the river stops earlier than in seasons of good rainfall. In a good year, therefore, the water-supply may suffice for 30 to 40 per cent. larger area than after an unsatisfactory monsoon. 600n.
- 45. Q. Does the supply vary very largely ?-Yes, to the extent mentioned already; we raise the water above crost level by means of temporary standards and boards. That makes a difference of about 600 million cubic feet.
- 46. Q. In a year of drought you connect depend upon having the Muthn reservoir full?—No, not to the top of the temporary weir crest. We store water at the end of the mensoen 2 to 4 feet above the orest of the waste weir by means of a temporary weir of standards and planks; whether the tank fills to the top level of the planks or not depends on the inter moreon rains. This also introduces an element of uncertainty in regard to the quantity of water available.
- 47. Q. Do you think that, generally speaking, you would get the full supply or not?—We are cortain of the lake alling every year up to the top of masonry crest.
- 48, Q. Then when you begin the rabi irrigation in October and November you should be able to count upon a certain amount of water P—The difficulty is that if the later mouseon rains fail, there is no water in the river to speak of and we have to draw upon the storage earlier. We cannot be certain what storage will be available till about the beginning of Decomber: that is our great difficulty. We have tried to work this out scientifically for the post two or three years. If we had failed to do this, there might have been extensive failures of coops by untimely failure of have been extensive failures of crops by untimely failure of
- 49. Q. Between what limits can you count P—Tho difference will be 20 to 25 per cent. between short and full storage; ence will be 20 to 20 per cent between short and this storage; we cannot put up the planks early enough to make sure of a full tank because there is danger of heavy floods overtopping the plank weir and raising the storage to an unsafe lovel. If, on the other hand, the planks are put in late and the later rains fail there may be no replenishment in that season. These circumstances render the storage uncertaint with the Weiterstein course. tain within the limits stated.
- 50. Q. The remedy is, I suppose, a supplementary reservoir ?—Yes.
- 51. Q. If you had that supplementary re-ervoir could you count upon a fairly uniform discharge?—The uncertain conditions in that case will go lower down. Now up to Loui we have got a fairly satisfactory supply throughout the year, and if we build another re-ervoir, the limit will be shifted. 12 miles further dawn, and beyond that limit the uncertainty will continue. The fact is we want very much larger storage than we have at present.
- 52. Q. Are you aware that on the great oanal systems of Northern India no applications are ever asked for ?—The villagers send up applications on the Sone Canals.
- 53. Q. I am talking of the Punjab and North-Western Provinces?—I am not aware of the conditions there.
- 51, Q. The village gets a certain number of sluices and the people work them; they distribute the water and there are no applications?—We cannot do that here; our water is too valuable except in the monsoons when the rivers are full. Our storage at other times is very expensive.
- 55. Q. You say in your Note, "Irrigation works get ne credit for increase of land revenue." Is that the case P -Yes.
- 56. Q. Is not an owner's rate charged on land ?- Not in the Bombay Presidency.
- 57. C. There is a book credit given to the canal, is there not?—Not on the new capital account works.
- (Mr. Muir Mackenzie.) The land is not assessed wet on Government irrigation works. The water rate is kept quite distinct from the land revenue. In theory the canal gets all the oredit it deserves, though in practice it may not get all. There may be some enhancement made owing to the increased security.
- 58. Q. (The President.) Thou the canal does not got full credit for what it does for the country P-It does not.

59. Q. (Mr. Ibbetson.)—Does not the introduction of Mr. M. Visa canal bring new land under cultivation?—(Mr. Muir vessuraya. Mackenzia.)—No, only the cultivation of old land is rendered more secure. There is only one per esut, waste even where 20 Dec. 01. there is no canal. If credit were given I think it would only increase book complications without any material uny nucrease book complications without any material addition of revenue to the caual.

Witness.—Noither could we guarantee the water-supply every year for irrigating the whole area new classed as irrigable.

60. Q. (The President.)—If you have sufficient storage reservoirs?—In that case, we can guarantee to the extent of the storage only; it depends again on the nature of the

[120 President.—It seems very important for the Bombay Presidency that all credit should be given to canals.

Mr. Muir-Mackenzie.-It would complicate accounts, without, I think, much advantage to the canals.

Witness.—(Continuing) You say, we might give water permanently without applications; what rate would you six?—(The President.) Its. 3 an acre for wheat.

Witness .- Our working expenses amount to about lts. 3-8, so it would not pay if the crop rate was only is. 3 per acre. We have a net revenue new of over Rs. 3,50,000.]

- fit. Q. I don't quite understand your point?—The more you extend irrigation the more you lose; our rovenue depends on the nature of crops more than on the area. A large extension of low-lated crops is a disadvantage from the point of view of revenue.
- 62. Q. I don't yet see your point?—Would you charge by the quantity of water or the crea irrigated?
- 63. Q. By the area? Thore would be the difference of Rs. 2 and Rs. 40 per nore that I spoke of.
- of Rs. 2 and Rs. 40 per nore that I spoke of.

  Of Q. Would you say to a man if he asked for irrigation for a dry crop, I cannot give you water because there is so much required for sugarcane?—The water-supply is hypothecated for a certain area and only the balance is a vailable. If every one were allowed to take water as he chose the supply would run short. In Northern India they admit as much water into the cannil as they can and they prefer wasting it down the canal where there is a chance of some of it being used to allowing it to run to waste in the river itself; here in Bombay we try to draw from our storage reservoirs as little as would just meet our wants because the water-supply saved is reserved for future uso.
- off. Q. In Northern India it is true that the rivers have a large discharge, but it varies and the supply in the canal is often insufficient?—There, I think, more than three-quarters is dry crup; here we have to regulate the amounts; one million cubic feet will grow 13 to 2 acres of sugarcano; for the rabi crops it will be 12 to 15 acres.
- 66. Q. Do the people that are growing sugarcane have to send in applications?—Yes; the sowings begin in February and go on into March and April; we calculate what supply will be available; we only take applications to the extent that we have water for.
- 67. Q. Dou't you think it possible to bring down your working expenses? We cannot in the case of high-rated
- 68. Q. Your working expenses are enormous compared with Northern India?-- I don't think so, our crop rates also are very high; compared with the capital cost of the works our charges are modorate.
- 69. Q. (Mr. Muir-Mackenzie.)—Our present working expenses are so much disguised by the system of accounts that it is impossible to got at them.

Witness .- Will you pleaso refer to page 12 of my Memorandom about the system of accounts in this tresidency; we can manipulate the area; for instance, we could cheek the area under sugarcane and increase that on rabi crops one acro of sugarcane is equivalent to about eight aces of rabi crops; on the Mutha Canal, by refusing water for erno we could brigate 40,000 acres instead of the 8,000 acres at present.

70. Q. (The President.)—Which is the best way of protecting the country against famine?—I think working on "preductive" lines; we should not lock up water on the chance of a famine; we should every year make an estimate of the water available for high class crops, and in famine years make some concession in favour of dry crops; please see and 12 section 0 of any llarge and any Another please see page 17, section 0 of my Alemonandum. Another point, in this Precidency, is that we have about 300,000 acres, which are estimated to be irrigable, but we only work up to 160,000. In other Presidencies they work almost up to their maximum.

Mr. M. Vis-

- Mr. M. Vis- 71. Q. It comes to this that in the famines, which do nafortunately occur, Aladras and the Punjah can protect themselves but Bombay cannot on second of the system 20 Dic. 01. to flowed :—I consider that water should not be reserved to a large extent for dry crops in a famine year because it would disorganize the cultivation of higo class crops; I had much rather have a fixed area of high class crops from year to year then reserve water for dry crops for which the decay is stock in ordinary rears, and only hecomore. year to year then reserve water for dry crops for when the domand is slack in ordinary years, and only becomes keen in years of drought; my proposals an this point are explained in section 9, page 18 of my Memorandum.
  - 72. Q. By 'fixed area' you practically mean sugar-eanc?—Yes, and garden erops; also a certain proportion of cereals and other orops.
  - 73. Q. Yon hegin to irrigate sugarcane in March?— Yes about February and March.
  - 74. Q. If you have a fixed area of sugareane you don't know in March if there is going to be on early monocon, and if the monsoon fails on the 1st of October and the tanks get dif, what would you do?—Oar ghôt reservoirs fill every year. We would only guarantee one-third of the area for which there is woter. In ordinary yours I would allow people to have cano under wells, but would not guarantee them water after October. That is the "permissible" area.
    75. Q. Your 'fixed' orce would be 'trictly limited?—Yes, otherwise the water-supply may fail.

Yes, otherwise the water-supply may fail.

- 76. Q. Is your "permissible" areo just what is over and above the "fixed f"-I should like to rofer you to section 9, page 17 of my Memarandam.
- 77. Q. As regards the "permissible area," if a man were to come and say—I want to start my sugorence now and nm prepared in November and December to go on with my well, would you make him pay less?—Yes,
- 78. Q. (Mr. Ibbelson.)—You say in a famiuo year you would refuse water to "permissible" cane and keep twowould retuse water to "permissible" cano and keep two-thirds for dry crops, but a mun gives in his application in March, and you don't knew till August how things will be? —I would accept his application conditionally on the water-supply being liable to be withdrawn if necessary in October
- 70. Q. De you restrict the area of sugarcane in a dry year?—Yes; we don't occept opplications freely.
- 80. Q. How do you know in March or April that it is going to be a dry year ?—We accept applications in Morch and we calculate the area for which we want mater up to the end of June, and issue passes accordingly. If we tide over the hot weother we have ample supply in the manson. After the monsoon also we usually have sufficient supply Arter the monsoon also we usually have sufficient supply for bringing to maturity crops sown in the previous hot weather. If the monsoon rainfall is gand end the tanks are full, we may give nater to the area which I have chassed as "permissible". If the water-supply is short, the per-missible area will be refused water and will have to fall buck upon wells. The "fixed" area will get water till March following. buck upon welle, March following.
- 81. Q. (The President.)-Is there much scope for exteasion of irrigation?—Yes; bul each work is judged by its direct productive value and if this is unsatisfactory the Government of Indio will hesitate to grant finids, no matter how strong the recommendations of the Commission may be. Sound finance is the test of success in irrigation as in other public department and cur first concorn should be to show n good return. In order to enoble us to show n good return we want to work our system on lines suited to local conditions and not on those kild down for other conditions in the North-Western Provinces and Punjab. Financial considerations are everything.
- 82. Q. We would not be here if financial considerations were everything. Don't you get as much money as you require for the maintenance of canals ?—It is stinted.
- 83. Q. Do you mean for construction of new works or maintenance of existing works?—Both—(paragraph 3, page 1 of Momerandum read out.)
- 84. Q. That is fer construction; are you etinted for maintenance?—The reduction in expenses on maintenance began with the abolition of the office of Chief Engineer and special Executive Engineers for Irrigation; from about 1885 the annual outlay, both for mointenance on old works and for new works, has been very low and the ton-denoy hos been towords severe economy.
- 85. Q. You have got works which ore not paying at oll?—My works in this district pay fairly well; they show the best results in the Presidency, because they are

- 86. Q. Do you consider that by spending more money you could get a greater return?—Yes, by increasing the scope of the works. For instance, the discharging capacity of the Mutha Canal may be increased from 250 cusees to
- 87. Q. World the expenses of maintenance be doubled?

  No, they would not be in the same proportion. If we provide more storage and work more on productive than on protective lines will our works pay. The more storage we have the more will our works pay. I guarantee that if I am given a chance to work the Nine Canal on our ornglines, we will apply the state of the full interest on the small couler. we will make it pay the full interest on the capital outlay; but there are two things necessary: we must be given more money and allowed to work on our own lines.
- 88. Q. In what may hove you been hitherto restricted? -The tendency of the orders of the Government of India has been in that direction (paragraph 3 of Resolution No 53-I., dated 9th March 1893, by Government of India, read out as in paragraph 3 of Memarandam.)
- 89. Q. (The President.)-Does the Government of India restrict you as to the amount you must use for engar-

Mr. Muir-Mackenzie.-Yes.

Witness.—Yes, and I have to look up water in expectation of its being utilized for other craps overy year.

- 90. Q. (Mr. Ibbetson.)—You would look to ceteras rather than to area ?—Yes; good returns are an indication that valuable crops are grown and the locality steadily benefits by the irrigation work.
- 91. Q. (Mr. Muir-Mackenzic) The Government of India say that certain works ero in by productive and certain protective. The Nira is a protective work and we can only give n limited quantity of its water for perennial crops after reserving sufficient to irrigate a reasonably lorge area under dry orops in a yenr of drought.
- 92. Q. (The President.)-As a result of the system you the year water moy remain numsed. If water is reserved for dry crops it may never be used in that particular season and may lie looked up till the next replenishment, or it moy be ran to waste.
- 93. Q Simply because it was kept for dry crops?— Mainly because of that; we have never been able to use the whole amply for high-class crops although there was the
- 64. Q. If there were no applications, nat a drop would have been wasted, if the people had utilized it, taking all the woter they liked?—If there are no applications and no control, the water-supply may run out in Morch or April, that is, in the middle of the second. We must control every port of the caual and regulate the flew in curounals accarding to the supply available; the circumstances are entirely different here to those in other provinces. We have a tendly different set of conditions and we desire that we may be allowed to manage things in our own way.
- 95. Q. The question is to protect the country against famino?—I should place irrigation in the first line of defence for protecting the country in times of famine, but irrigation connect entirely protect the country in such years. We must have irrigation works to the utmast extent possible but at a reasonable outlay,
- 96. Q. You say in paragraph 20, page 6 of your Memorandum, "in good seasons the black soil of the Decean yields a full harvest and in ordinary years a fair horvest;" I suppose there is great variety in the black soils?—Yes, there is a great variety.
- 97. Q. In some places more than others they take irrigation?—Black cotton soil is the worst for irrigation; is oracks; other classes of black soil which are mixed with sand or hove a murum sub-strotum are favourable, especially for sugarcane.
- 28. Q. Do yon know of what proportion of the Deccan black soil one might say that it cannot he irrigated at all?—A very smsll proportion. On all kinds of black cotton seil if there is a chonce of good rain, it pays the people to raise food craps and cereals on rainfall rather than on canal water. Irrigation from canals can be carried on with profit for growing all crops which cannot grow on rain sloas. We found at Ahucduagar, where the soil is black, they take water, but at Surat and Broach under no circumstances will they take it?—I think that there is, more sand in the Ahmeduagar soil. Scrat soil is inferior for purposes of irrigation. of irrigation.

- 199. Q. I see you say in paragraph 29, page 5, "during 1895-96 the area irrigated in the Decean and Guzarat vos 74,923 acres and the assessed revenue from water-rutes amounted to Rs. 4,62,476. During 1897-98, though the area use to 126,51d acres, the revenue amounted to Rs. 4,03,139 only, so that with an increase of 69 per ceut. In area the increase in revenue was about 9 per ceut. only?"—1897-98 was practically a famine year and there was function in the previous year. People were auxious to replenish their store of grain and there was un extension of try crep irrigation.
- 100. Q. The Maswad and Ekruk tanks cannot, I suppose, be connected with the gháts?—I think not the Ekruk; an attempt might be made with the Maswad; the question should be investigated.
- 101. Q. You say on page 8 in paragraph 6, "the formalities of the water applications and special measurements, etc., are also obstacles in the way of extensions of irrigation"; you proposed the "fixed" area on that ground?—in order to enable us to dispense with water applications by crops, I have proposed 'fixed irrigation" under my scheme. I propose a dispense with water applications entirely in the case of small arrigation works only.
- 102. Q. Would the "fixed area" be the same land every year?—It would be the same for six years and would then be changed. Under my scheme one-third of the water-supply will be given to the "fixed area" always; the remaining two-thirds will be given to the "permissible area" in good seasons and be applied to dry crops in seasons of drought.
- 103. Q. If a man held 300 neces he might without sandleg in an application grow sugarcane over 100 acres?—Yes, I should restrict the erea under sugarcane to one-third of the total urea of the blocks.
- 104. Q. He might grow it on any hundred acres?-Yes.
- 105. Q. Ite might change the field so long as he did not exceed the area?—Every village under command and which can be conveniently served by the canal should have one or two specified blocks to which trigation should be confined; the people of the village must agree oming themselves to practise irrigation in that block; people who have no land of their own may lease out plats from others, we is at prosent done, during the currency of the lease for water-supply. I should guarantee the water-supply for such blocks for six to siven years at a time.
- 100. Q. Don't you think six years too much?—No. We have sugarcane crop running six years without re-soning. That is unusual of course; the usual enstone is to have a ration crop for two or three years.
- 107. Q. (Mr. Muir-Mackenzie.)—Would you endeavour to make phads?—Yes; but people will do the distribution among themselves as tiny have done in Nusik and Khandeck; this point is explained in Mr. Beale's report.
- 108. Q. Within a certain aren the entireators would probably arrange their own rotation?—Yes. If we have a "fixed" area for which we guarantee water the people will lay out their money and manure their land; under the present system there is too much uncertainty.
- 100. (2. (The President.)—Would you bind them to take water?—This is explained in paragraph 65, sect. 9 of my noto (read out.) The proposals I have made are, I think, under the parent circumstances the best. If water were giren to any and every part of a village there would be sectoral loss. With the same quantity of mater we shall probably be able to irrigate 60 per cent. more area to block than if the irrigation were in scattered panches, admit there will be some difficulty in giving opportunities to all enhivators to irrigate, but they can arrange among themserves and obtain plots either in exchange or by lease as at present. At present enhivators from parts of the district where there is no small irrigation bring their capital and obtain lease of plots of land for sugmeans enhivation. The same might be done in connection with the blocks. Sanction to grant a block may be withheld until the villagers agree among themselves to give a shune to a reasonable proportion of the cultivators in the village. This seems to be the last possible system under existing circumstances, but if a better system is suggested we shall be glad to go into it and give it a time.

The population of the Bambay Presidency according to the census of 1901 was 16 millions; the net cropped area is more than 19 million acros, giving a rate of more than 1 sers of cropped area per head of population. In all other provinces—wide Appendix I of any Memorandum—the rate per head is less than 1 were. One reason why irrigation is not so extensively encouraged in this Presidency seems to be the large area cultivated compared with the population; if they get a good crop once in two or three years they can Mr. M. Visafford to live on it.

vesturaya.

Another point I wish to bring prominently to notice is the percentage of area of well irrigation on total cropped area; in Aladius this percentage is 4:89, in Bombay it is 3:40, while the corresponding percentages for tank and canal irrigation are 19:60 and 0:70 for Modras and Bombay respectively. I think these figures show that adequate provision is not made in Bombay and that there is large scope for the extension of canal and tank irrigation in this part of the country.

I have said already that the presention of cropped aren to population is larger in the Bombsy Presidency than elsewhere. Dry crop irrigation will not pay in Bombsy; over 92 per cout, of the irrigation in Madras is under paddy or rice. If rice is excluded, other irrigation, including percannal, is small. Irrigation is mainly a question of rice cultivation in Madras. We have very little rice cultivation in the Decean, because other food-grain crops like Juar and bajrs are grown on rainfall with less expenditure of labour and capital and less trouble than rice, which ordinarily requires irrigation in addition to rainfall.

- 110. Q. This country has suffered very much during the last few years from founce. Supposing you had reason to believe that in 10 years' time there would be another famine, what would you do for the Itreran before then?—Irrigation at the best will only be a partial remedy, but I should have works of several kinds—tanks fed by ghât rainfall. I should also try large canals constructed like the inundation cands elsewhere taken from rivers fed by ghât rainfall. I there can would be expensive, but the expense must be faced. The water which is now running to the sea will be carried in these canals which in a year of drought will distribute moisture over the whole country; depossions along its course teay be repelemented; and knowled water whenever such canals pass will be raised and well irrication will be encouraged. The next class of works, though not the least important, sto village tanks and wells on small rivers; these may be largely extended. From this class of works Government should not expect a large revenue. If they did, there would be no progress, but the indirect results will more than repay the outlay on them. As suggested n my Memorandum 12 lakls may be spent annually on irrigation works, 10 on larga tanks and canals, and 2 on minor viltage tanks and river weirs. But the more money available the better.
- 111. Q. What works would you propose to spend it on?— It is important to have a proper hydrographic survey of the country first.
- 112. Q. That won't cost very much?—Only 12 lakles per annum, for the next 8 to 10 years; there will then be some excellent schemes. Meantime we can carry out reasonably good schemes ulready projected.
- 113. Q.—(Mr. Muir. Mackenzie.)—Why are you confident that the schemes will be excellent; you will remember that a large number of projects in connection with Lake Fife and the Masuad were prepared which it was thought would be excellent, but they were not su?—I would like a reference to paragraph 30 of my Memorandum, in which I have explained why the Decan rooks were a failure. I have all along contended that if the works are managed on lines suited to local conditions they will show better results than they do now. I have admitted, however, that Bombay works will nover be as remanorative os works in Northern India. I don't ask that expenditure in this Presidency should be anything like what it is in other provinces, but there should be a reasonable nilouance made to this Presidency also, which there is not at present.
- 114. Q. How are you auto that the mistakes made in the past won't occur again?—I think we are wastr now.
- 116. Q. (Mr. Ibbetson.)—Why do you think in ten years these schemes will repay Government when the present schemes don't?—They will pay indirectly and they will pay also a reasonable direct return if the present anonulus and difficulties are removed.
- 116. Q. Do you think the present schemes do pay Government?—The Mutha pays more than 3 per cent. and the Nira about 2 per cent. and on the two, if indirect results are taken into account, the return to Government, if I may risk an estimate, is probably more than 6 per cent.
- 117. Q. (The President.)—Do you put us your first condition certainty of supply? That certainty is always possible in reservoirs fed by glat minfull.
- 118. Q. Having got your survey and knowing all about the country, where would you look for the first means of

vestaraya.

Mr. M. Fig. security; would you look to the storage of the ghat supply? vesvaraya. —Yes, and then go to the plains.

- 20 Dec. 01.

  119. Q. (Mr. Higham.)—With regard to the new storage
  works on the ghôte. I nuderstand these are the only proposals made?—Yos, I have submitted rough schemes for four new tanks for this district.
  - 120. Q. Are there any ather possibilities af etarage P-There must be several other eito. These are all that have been examined.
  - 121. Q. Where?—In the northern parts of the Peona district. Also, the existing works the Nim and Mutha Canals, may be extended by increasing their storage by means af new tauks and by extending the cauals and their distributaries.
  - 122. Q. You can make more storage works than are shown here?—I think many more.
  - 123. Q. Suppose yan get a greater increase of storage tanks, could you use them?—We could if we work on the lines I have suggested now. We should extend the entitivation of crops which do not depend on rainfall.
  - 124 Q. Yaa would not extend your area of cultiva-tion?—The totsl area may not increase; our cultivation in ordinary years should be intensive.
  - 125. Q. I am epeaking of this tract of the Poons dis trict in which you have no irrigation; could you extend irrigation on that by finding more ctorage teaks in the ghate?—I think so; na detailed surveys have been made; we have rough surveys made in some few instances chowing that it in possible.
  - 126. Q. Could you make a new branch to the Nira Canal 120. Q. Come you make a new branch to the Nira Canal and divert n portion af the supply to another part of the district, if you have a greater supply available at the head of the canal?—We can extend by taking a branch from the Nua Canal to Satam and Sholapur. Mr Beale has an idea of having a banneh canal.
  - 127. Q Provided you got water?—Yee; storage must be first pravided. Before we think at extensions, we should increase storage for the Matha Canal in this district. The present canal is 70 miles long and half af it is not working. There is ample scope for using all the water we can storo np in the ghata.
  - 128. Q Could you command the north-castern part of the district by the ghat tanks ?—I believe so.
  - 129. Q. What about the Bhima ?-It is very law; it is very deep; but if we have a very high were it may be possible to take water for irrigation from it; whother such a echeme is financially possible depends upon the result of
  - 190. Q. What about stomge?—We should probably have to store water near the ghats and take water a long way in the rivers and raise where required by means of pick-up
  - 131. Q. Can't you store up on the ghats?-Wo can, sir, but no regular survoys have been made.
  - 132. Q. I suppose na proposals have been made because the river is much below the level of the country?—Yes, that is the general impression. But we may be able to find sites for reservoirs though we chall have to go a long way to get command.
  - 133. Q. Lest year, 1900-01, you irrigated over 52,000 acres on the Nira Canal? Yes; I can irrigate 100,000, if nicessary. Area and the nature of crops irrigated should both he tuken into consideration in estimating the results in any year.
    - 134. Q You irrigated 47,000 acres in 1897-98?-Yes,
    - 135. Q. And 42,000 in 1896-97 ?-Yes.
  - 136. Q. These were the largest areas?-Yes, in recent venra.
  - 137. Q. Wero they all very dry years?-Yes; axcept 1897-98, when in order to ropleuish their stack of grain, the oultivators irrigated a very much larger area than usual; they did not wnit for rain-water.
  - 188. Q. What was your supply in 1897-98? -Our supply at the tanks was full.
  - 1s9. Q. You had sufficient supply all through 1899?—No in 1899, the Bhatghar Lake did not fill. We restricted out area and regulated our supply.
  - 140. Q. This shows a much larger area because it includes greater area of food craps and less of sugarcana?—Yes; the proportion of the sugarcane crop is only 10 per cent. on that canal.
  - 141. Q. Of the normal area?-Yee, 10 per cent. of the normal arcs.

- 142. Q.—How much this year ?—We have got the same area, aheat 6,000 acres of perennial crops. I have uet gat the figures for the first official year here, as the Revenue Report is not ont.
- 143. Q. Yau do not know what it was ?-No, I have got figures for other years.
- 144. Q. Yan had a very small area in 1892-93?—Yes the canal was young then, and not developed.
- 145. Q. In a wet year what ie the effect on the area ?-It will probably ga down to 30,000 acres. It there is pleuty of raia, water is taken only for personnial crops and a little perhaps for juar; some water is atways taken for rabi.
- 146. Q. (The President.)—Is there any rice at all?—No; very little.
  - 147. Q. Not worth mentioning !-- No.
- 149. Q. (Mr. Higham.)—Dose engarcane come under kharif or under rabi ?—Under kharif (explains from the hook).
- 149. Q. Take 1898.99; you had 34,000 acres; yan ear it was mostly percunial?—No, it was not mostly percunial.
- it was messiy persunial rank, it was not mostly persunial, 150. Q. (The President.)—You put it too strangly when you said that in a wet year thera would be nathing but persunial crops?—I mean that in a wet year the of the revenue will be from percunial crops; that from the other crops would be very simil, through their srea may be comparatively large. But area alooo is not a true index of the results. One acre of sugarcane is equivalent to 8 to the results. One ac 10 acres of dry crops.
- 151. Q. Undar any oircumstances would the area of percential crops he more than 25 per cent? Never.
- 152. Q. (Mr. Mnir-Mackenzie.)—By your system you can take it in a third?—Yes, in the blecks only. Outside the blocks, the dry arop area will preponderate.
- 163. Q. How maeb of your area would be perennial under your system f—About 10 per cenl.; percunial crops would get 1rd of the water-supply, but one acre of cano takes as much water as 15 acres of other crops so the area would only be about 16th.
- 154. Q. (Mr. Higham.)—You say, "we are not allowed to work on our own lines," who do you mean by "we"—the Local Government?—No, the Dopartment.
- 15b Q You are not allowed to work on your own system?—No, not in the manner we thick best adapted to local eirenmetances.
- 156. Q. You attribute this to some orders of the Government of India ?— Yes.
- 167. Q. What orders are they?—The Government of India have laid down a general policy for all the provinces.
- 158 Q. Where is that policy laid down? I do not see it here?—(Reads.) It is laid down here.

  159. Q. You say this means that the canal is not to be worked for productive purposes.—That is what we generally understand.
- understand.

  160. Q. Yon say you are fettered by the Government of India. Where are the orders?—I do not say there is any specific order of the Government of India which applies to this Presidency alone, but the general impression of the Government of India is that where there is extensive irrigation that means protection. In our experience here protection does not mean production. Government have hid down general rules for all provinces, but they work badly here. We are guided by the rules and general policy of the Government of India.
- 161. Q. In this particular cass the Government of Iudia . merely remark that in a sesson of drought there has been a decrease at area. It is usual to expect an increase of area. un a dry year. It seems a harmless remark on which to base each an assertion?—But increase of area means in a large number of eacs, decrease in revenue in the opecial circumstance of this Presidency.
- eircumetaneea of this Presidency.

  162. Q. That remark may he made in regard to any canal in a sessen of drought. I do not see how you can conceine it in the way you do?—For this reason; our water-supply in a year of drought is limited and we have to help the percannial crops of the purrious year and provide water far a reasonable area of new sowings af the same class of crops. If water is diverted from thesa to increase the area of dry crops, inrigation af percannial crops would be disorganised. In this Presidency we ought to look to valuable crops rather than the extension of area.
- 163. Q. You have no other order to restrict your supply to protection of dry orops?—No direct orders. I think it is the impression of the Government of India that wherever

there is extension of area under irrigation there is protection. Protection means production elsewhere, but not here.

- 164. Q. Has your Public Works Department ever made any representation to Govornment on the matter f—I think so. I cannot say definitely what they have done, but they must have represented the difficulties several times.
- 165. Q. To explain your plan a little more fully why do you restrict the sees to 3rd of the available water-supply F Because we can guarantee water-supply to that extent only in a year of drought.
- 166. Q. Why don't you propose to restrict to 18,000 acres?—Because you object to our working the ranal on productive lines in ordinary years and protective in famine years. Possibly I may not be very clear; it is not 3rd of the area; it is 3rd of the water-supply.
- 167. Q. One-third of the water-supply P-Yes; I would set that apart for perennial crops every year; that would give fixity to irrigation.
- 168. Q. You guarantee and of the water-supply to perennial crops f-Yes, to the blocks in which I propose to carry on "fixed" irrigation.
- 169. Q. They can use the water for what they like?—No: I would have about one-third of the area only under sugarcane; some such condition would have to be put in.
- 170. Q. Yon would not interfere in any way with the village?—Not so leng as they manage properly. If they wasted water or quarrelled among themselves, we may interfero and regulate.
- 171. Q. Will they not look upon it as a permanent assessment?—We don't want permanent assessment; no only want fixity for six or seven years. I should accept joint applications from each village for six years.
- 172. Q. What would you charge for \$1d water-supply? -About Rs. 12 to Rs. 16 per nore.
- 173. Q. If you guarantee and of the supply, how can you charge upon nereage t-The area which one third of the supply annually uvailable can irrigate will be estimated. This area will be distributed among the villages. There will be a fixed rate per acre on this area. The only condition imposed will be that the area under sugarcane should not be more than one-third of the total area of the block.
- 174. Q. You will estimate what the area would be ?-Yes; approximately. It is much easier to estimate for a block than for a field.
- 175. Q. Will you measure the area every year?-No; once measured, the "fixed" area is known.
- 176. Q. You say, "I give you for his years it supply and we estimate that you should trigate so many acres?"—But one-third of the supply has nothing to do with the individual villages. The entire area of the blocks of all the villages will require one-third of the anpply.
- 177. Q Suppose the supply is short?-We guarantee only ird of the minimum available supply. Our glist-fed tanks always fill-even in a year of severe drought.
- 178. Q. (The President)—For statistical purpose, you would measure up the area !- Blocks are fixed for six years and the area is known. No measurement is necessary every 1 car.
- 179. Q. Suppose a man has got one or two fields outside the area and puts in sugaranc?—We would not give him water rue pt on the permissible system.
- 180 Q. (Mr. Muir-Mackenzic.)—Do you take it for granted that they would take water?—They are willing to take it on these lines on the Nira Canal; people have aheady seat in applications. I believe the Local Covernment is favourably disposed to give the scheme a trial if it is shown to be practicable.
- 181. Q. (Mr. Higham.)-You think you will irrigate a larger area of percunul crops it you guarantee them and of the supply than they have irrigated in the past?—Yes, we have now 5,000 serve of sugarcase on the Nira that brings about a lakh of revenue; we should have 7,000 under thy repente :
- 182. Q. Why?—Because during years of good minfall we can give water for personnial crops which in bad years will be protected by wolls.
- 183. Q What would provent them from putting down sugarcano now under the present system !—They are not cure of the woter-supply; if rain fulls, we restrict the supply.
- 184. Q. The cultivotion of percunial crops on the Mutha Canol is now more or less a garoble?—I think so, as regards \$rd or \$th of the area.

- 185. Q. Is the supply to perennial crops uncertain on Mr. M. Vister Nira Conal?—Yes, it depends on the locality. In the vestaraya. upper reaches the crops are practically safe. In the middle of the canal the supply is uncertain.
  - 20 Dec. 01.
  - 186. Q. Taking an average ?-About 4th is uncertain.
- 187. Q. (Mr. Ibbetson.)—There would be less gambling under your new system !—Yes.
- 183. Q. And then in addition to that you would have also the 'percaulal' area on which there would be a certain amount of chance ?—Yos, that is a great point.
- 189. Q. (Mr. Higham.)-What do the people do in the pear of famino; do they reduce the area of cane of their own accord and increase the area of food crops?—We reduce the area of sugarcane for them; the whole thing is done by us. My experience in this district is that the demand for sugarcane in a bad year is as great as in ordinary years.
- 190. Q. I think the Bombay Government have several tirnes explained the redection in the area under sugaronne as duo to fumine and plague ? - It was due to the low rate of raw sugar in 1897 and 1898; these abnormal causes operated also. But since 1899, io which year I took charge of these enfals, the domand for water for sogarcane has been as keen as for dry crups.
- 191. Q. Orlinarily considered, records would collinate as inucle cause as they possibly can even in a famine f-Yes; that is the teodency.
- 192. Q I approve in a famino year an acre of eace is quite as good as an acre of fodder crops ? A great deal better; it will employ more men and for 12 mooths justead of 4.
- 193. Q. An aere of augarcano requires more water than As acre of dry orops?—Yes; about 8 to 10 times more. The gross produce per acro of sugarcano is valued at about 18. 600 and folder crops fetch about Rs. 80 in a famine year and Rs. 80 in ordinary years.
- 191. Q. (The President.)—How many cubic feet do you require for an acce of sugarranc P—About B or 4 lakhs of cubic feet. The yield of came is worth about 72 times that from rabi crops,
- 185. Q. It will pay you better to uso your water upon dry crofs than it will nuon sugarcane crop if sugoreant takes 10 titles the amount of water and only yields 72 times the produce?—But the demand far engarcane is constant; not so for the dry crops. Desides, the dry crops require water chiler in the monsoon or in the rabi season when the water is not so valuable.
- 196. Q. Coold you irrigate seven times os great an area of dry crops as you could of cano if you stop sugarcane altogether?—Ten thues more of rabi; for every acre of cane we can inigate 10 or 12 acres of dry crops.
- 107. Q. Would water be taken ?-Only in years of drought, not always. For percential crops the demand is constant.
- 103. Q. (Mr. Muir-Mackenzie.) Do you think that the rates now charged on the Nira Canal are unnecessarily low? Do you think that people can pay a higher rate?—
  I think the rates are very good now, but they ore capable of increase in three or four years' time.
  - 199. Q. Why must we wait ?-On account of famine.
- 200. Q. Propie on the conal are rich and prices of crops have rison ?-Yes.
- 201. Q. Why do you say we ought not to increase them; I ask you generally whether the rates charged are in your opinion excessive or too low?—For ordinary, dry, and mousoon crops the rates are fair ; for cane the rate is low.
- 202. Q. How long ago were these rates discussed? -On the Nin Canal very recently; on occount of famine they have not enhanced the rates.
- 203. Q. (Mr. Higham)—Could you give me details of your expenditure on Revenue establishment—the establishment that you have to maintain on the Niro Canal ?-Yes. (Refere to statoment I C.)
- 201. Q. What is your charge on establishment? About 20 per rent. of the gross revenue.
- 203. Q. What do you allow for collection?-Five per cent. on total receipts.
  - 206 Q. Who does that go to !- The Civil Dopartment.
- 207. O Twomiy-fire per cont, is taken for the main-tenance of local establishment ?—Yes.
- 203. Q. Do you know how they exactly divide the estab-lishment between the work; and evenue ?-We have got

a certain amount of expenditure on works and repairs; on that they charge 25 per cent. The whole of the balance goes against the Rovenne establishment. vesvaraya.

20 Dec. 01 - 1

- 200. Q. You recommend as one means of protecting the provinces from famine that the Government of India should allow you to spend about 10 lakha a year on new
- 210. Q. Is that 10 laklis for the whole province or fer the Poona district ?—For the Presidency proper excluding Sindh.
- 211. Q. I think the cost of irrigation works on an average is about Rs. 200 per sere?—Yes, according to the present system of accounts.
- 212. Q. Ten lakhs a year would ultimately go to increase the area by 5,000 ucres per annum? -Yes.
- 213. Q. At the end of 20 years you would be prepared to meet fumine with 100,000 nerce?—Ves, it looks small, but it would mean double the present area.
- 214. Q, What percentage would that be of the area under oultivation?—Something very small; I do not expect any great results from irrigation alono; have said so in my Memorandum.
- 215 Q. You say double the provent area?—It is not enough; if you give 20 lukhe it would be a very good thing.—I only montioned what we were likely to get; not what I thought was necessary. Before the famino we were getting 1 or 2 lakhs a year. So 10 lakhs are a large amount comparatively. I would welcome 20 to 30 lakhs.
- 216. Q. (Mr Ibbetson.)-The cane is a very valuable erop; you cannot afford to ried it; it takes a large quantity of water; you must know how much you have to provide for. In your note von early the cultivator grows for der crops in the hope of being able to do it without your unter; he goes on waiting from day to-day hoping for rain and when he does want your water he wants it in a hurry and must get it at once; any delay on account of his having to submit an application would be very injurious; would it do to have applications for case only, to give the came area preference but allow people to use the balance of the nater as they third?—In the mensoon there is no difficulty; on many cands there is some water to spare and this they can use. There is n Government order permutting us to give water for dry crops without waiting for application.
- 217 Q. Hate you never in your time imposed double rates on men for tiking water without application !- Not on dry crops, except when all the water was required for crops for which water applications had been accepted.
- 218. Q. Why not extend the same principle to those who take water for fodder crop, wheat, gram and fuar when they choose at the end of monsoon as long as you get your sugarence watered?—Our water-supply becomes very valuable after the monsoon Our stool is limited and we valuable after the monsoen. Our stook is limited and have to use it in as profitable a manner as twenthe. have to regulate between sugarence and other crops.
- 219. Q. Suppose you give sugarcane the preference then would you give water for other crops without application?—Only where we have an ultimated supply. The supply is so uncertain; we have to look inhead and provide for sogarcane sowings in Murch or April,
- 220. Q. Before 180 , I understand that a great deal of your water was unused on these canals?—To n great extent; it was in 1898 als; but we nover have any water unused in these days, not during these last three years.
  - 221. Q. Before that P-The people would not take it.
- 222. Q. Would they not have used your water if you had allowed them to take it without making an application?
  —It might have had some slight effect: perhaps about 6 per cent, but we did not want to let the aron to go out of our hands.
- 223. Q In a good year you abolish application?—No, we rolax stringency, in accordance with the orders of Gov-
- 221. Q. The application system would only be worked strictly in a bad year?—Yes, but sometimes we have to place restriction year after year, except in the moonsoon, if there is a coasiderable extension of perennial crops under the canal. This remark applies to the Mutha Canal only, which is a productive work.
- 225 Q. In your scheme of irrigation you guarantee 3rd of the water-supply, presumably for cane irrigation, and give 3rd on your permissible system; if people are willing to give 3rd on your permissible system why not get the urt 3rd aton on the same terms, that is have 3rds permissible and no fixed area? Because in the permissible

- area then there would be uncertainty of oultivation; water would not be available in a year of drought,
- 226 Q. Do you think they will always prepare their land for 1rd if it is fixed 9-Yes.
- 227. Q. They won't prepare for 3rds?—They will sow every year; my object in having 3rd permissible is to have 3rd of the water-supply in a famine year for dry crops. They prefer to have an assured supply which would only be a wininble for the "fixed" nrea.
- 228. Q. (Mr. Muir-Mackenzie.)—If you don't have a fixed area you don't get extension?—No.
- 229. Q. (Mr. Ibbetson) You say this permissible water would be very largely used by people with wells ! Yes.
- 230. Q. Is it not waste to give oanal water to people who have got wells?—It pays them to use cansi mater. If they are left to wells alone, unnided by canal water in good years, they will abundon irrigation.
- 231. Q Speading of tunks, you say " smaller tanks perform a useful office in Madras, namely, to protect the rice or during a break in the weather." Why should not they do the same in the Decem ?—Because they have rice in Madras; we have no rice here.
- 202. Q. 14 there no rice in the Decean?—Very little; there is rice on the hills, of an inferior kind; it does not pay the cultivators to go to the expense of rice caltivation here.
- 233. Q. Would small tanks be of use generally in the Deccan ?-Yes, small tanks will do good in many ways.
- 284. Q. Hew?-There will be moisture and the waterjevol in wells will be high in the neighbourhood.
- 235. Q. Would there be any irrigation?—A perhaps; indirect irrigation from wells there will be. -A little
- 236. Q. Directly they won't pay ?-No; small tanks will not pay in the Decean.
- 237. Q. Do you think people would be ready to contribute for their construction?—I think they may be neked. The experiment is worth a trial.
- 238. Q. You say, "one reason why well irrigation is not largely practised in that the sub-soil over wide areas is rocky buyon think popple nould use wells hargely if they had them; would it be profitable to work them irrespective of the east of making them?—In a famino year they would
  - 239. Q. That would be one year in ten?-Yes.
- 240. Q. Would it pay n mon to use n well if it were made for him?—It would depend on the enterprise of the man; if capital and manure were forthcoming it would pay.
- 241. Q. You say that it is by artificial debits that working expenses are enhanced i-Not as regards the woking expenses; the charges are fair on the Nira and Mutha Canals; but in regard to capital expenditure there are artificial debits. are artificial debits.
- 212. Q. Is the capital expenditure enhanced?—Yes; to some extent by artificial debits.
  243. Q. On the Matha and Nira Canals you have sepa-
- rate establishments for supervision of irrigation?-Yes.
- 241. Q. Your working charges ore actually what itcosts ? - Yes.
- 243. Q. There is no artificial debit !-- I am not prepared to go so far as that.
  - 216. Q 1s there a large artificial debit?-No.
  - 217. Q. They are mainly netval?-Yes.
- 218. Q. You say that the actual average working expenses would be about Rs. 3 per nere?—Yee; they vary; Rs. 3 ore for the whole area in the Presidency. On the Mutha Canal the working expenses amount to Rs 7, because the principal crop is sugarcane.
- 249. Q. You say that'an nere of cane costs much more for maintenance than an acre of juari?—Yes.
- 250. Q. What makes up Rs. 7?-Maintenance, repairs, and establishment.
- 251. Q. You say the avarage is Rs. 3, and cane, which forms a substantial portion of your crops costs Rs. 7. What does just and wheat cost?—A good deal less.
  - 252.. Q. Could you give me an idea? Say Re. 1-8.
- 253. Q. Suppose you double the area of wheat and justi you would not double your expenses ?—Nô, we would reduce them, that is, judged by the rate per acre.
  - 25 L. Q. Your lis. 3 includes all crops ?-Yes.

- 255. Q. What is Rs. 1-8?—For wheat and rabi crops only; the average is Rs. 3.
- 256. Q. As radi only page Rs. 2 and working expenses are Rs. 3, therefore you say it would not pay you to increase your area under wheat? I am referring to the results in the whole Presidency. We have get about 100,000 acres under inigation. I have said the total area considered irrigable is 300,000; supposing we had all those 300,000 ander radi area our total revenue would be less than what it is now.
- 257. Q. On page 13, you say; "the Executive Engineer is required to keep his tanks and canals up to a certain standard of efficiency and when he has done thus the water may run to waste or remain lacked up in the tanks for all he cares." Is this an exaggeration?—I say so to make the position clour. We have not worked that way in this district.
- 253. Q. What I want to know is this. Is there anything in the present system which could show to the Executive Engineer how the causal pays?—The Revenue report shows that
- 259. Q. Not until the Revenue report comest-No, the final lighter site cent to the press by the Examiner, Public Works Accounts.
- 260. Q Could be not get an idea ?-Yes, a rough idea from more and expenditure in his own accounts.
- 261. Q. Is there anything which you would suggest to outble the Executive Engineer to have a keener in eight into the use of water?—I think the Executive Ingineer must study carefully the irilgating capacity of the work, and watch the operations from week to week; otherwise if there is a deficiency of water the crops will suffer or water may be locked up and remains unused.
- 262. Q. All these things depend on the man who has charge ?—Yes; I have get charge of the Mutha Cmal, and if I do not cith the selt, I may show a saving af, say, Rs. 10,000 and get enedit, the re-ulting evil effects will not be felt in my time, but in my successors.
- 263. Q. Is there then anything you could suggest that would give the Executive Engineer a keener ineight?—If a programme is drawn up to see mouth by mouth what water there is and what mea under irrigation, the Executive Engineer will be able to take steps to, stop extension of irrigation if the water-supply is scanty, or to extend the same if the supply be abundant. If they know that we are able to give water liberally, probably people at the tail of the canel will take it. There has always been less water than there was demand for in my time.
- 264. Q. You never had surplus water P—We never had more water than we could use during the last three years. In good years, they do not want it for ordinary dry crops, and then there is a surplus.
- and then three is a surpus.

  265. Q. Do you know the reason of the difference between Imperial and Provincial districts ?—There are several classes of works in progress in a district. Irrigation Work (Imperial), Military Works (Imperial), Reads and Buildings (Provincial.) The district is classed as Imperial if works of that class prependente, or Provincial, if the major portion of the expenditure in the district is from Provincial Funds. Certain fixed percentages are elanged for establishment on all miscellaneous works and the balances of expenditure debited on bloc to the class of works which decides the classification of the district. In the Shelapur district only fixed percentages are charged on irrigation works (refers to para. 36 and reads from Appendix, page 23), and the result is the establishment charges are very low in that district.
- 260. Q. At page 10, paragraph 30 of your Note you say. Total east of maintenance, including share of revenue management." What is the share?—They charge 25 per cont. on actual works expenditure.
- 267. Q. Of the two canals, which do you say is protective P-The Nim.
- 268. Q. I understand that you actually held up water in reserve in order to provide against a year of drought?—Yes.
- 260. Q. Are there any orders to that effect?—It is regulated by practice and by the general impression that the Government of India want a large area of food and fooder crops to be irrigated, especially during years of scarcity.
- 270. Q. The general impression is that the Government of India wish that food and fodder crops should be protected?—Yes.
- 271. Q. There are no specific orders? -I have already quoted some orders which can be read that way. I have

- also explained why the Government of India associate Mr. M. Fisincreased area with improved results.
- 272. Q. You say you cannot give sufficient water for high class craps?—Yes, now-a-days, to the extent there is 20 Dec. 01. demand for it.
- 273. Q. Practically there is no demand for water, except for these high class crops, in a year of fair rainfull?—No large demand.
- 274. Q We were told yesterdny that certain people would take any amount of water for dry crops if you give it every your?—There is no demand for thry crops; they won't take the water; they will wait till the last moment for ram, and if rain fails, then they rush for canal water.
- 275. Q. They won't begin to irrigate before they know that the rain will not come?—Yes, they won't insure their crops beforehand.
- 276. Q. You say, "fear of enhancement of revenus exists in the case of well irrigation;" do you say that from your own knowledge?—The statement has not be correct; I have heard reports, but have no personal knowledge.
- 277. Q. (Mr. Muir-Mackenzie.)—Have you ever heard people say so ?—Yes; I think it is not a fact.
- 278. Q. (Mr. Ibbetson.)—There is no enhancement, but they are alraid?—Yes, there is no death about that. It would be a good thing if Government published their intention broadenst; then there will be no fear.
- 279. Q. Do you suppose that in this district there is one year of famine in ten?—I could not say. There have been four bad years within the past six years.
- 280. Q. How many scanty rainfalls are there in ten tears P-In the epstora part of the district it would be quite five.
- 251. Q. In the western parts ?-Nine years out of ton are fairly good.
- 282. Q. How many years in the eastern part?—Four good years, five had years, and one a funine or very had year.
- 288. Q Do you know why Government has prohibited the irrigation of sugarcane in the neighbourhood of towns and villages !—For sanitary reasons.
- 284. Q. Are you forbidden to give water to sugarcane within a quarter of a mile from the villages?—Yos; if there is a nulla between, water is allowed; otherwise irrigation of percunial crops is generally forbidden, within a mile of villages.
- 285. Q. (Mr Muir-Mackenzie.)—Is there an order to that effect?—Yes.
- 256. Q. Can you produce it ?—Yes; I can There are atrong objections to a heavily minured erop in the vicinity of a village.
- 287. Q. (Mr. Ibbetson.)—What kinds of crop are heavily manured?—Sugarcane especially. Whenever there was irrigation formerly it is not provented; but only extension of irrigation to new lands within ‡ mile is.
- 258. Q. In compensation given to water-logged lands P—I have never received an application; I should think Government would be very favourably disposed to consider applications in cases where any real damage is caused by water-logging.
- 289. Q. (Mr. Rajaratna Midir.)—I find that the capital outlay on irrigation works in the Bombay Presidency, direct and indirect, was 486 lakhs, of which you have only cleared off 5 lakhs to the end of the year, thus leaving a large amount on the wrong side of the account. No wonder the Government of India objects to further grants; can you tell me how this is P—It is due chiefly to accoundation of interest charges. I have already said that our works do not pay The yearly not revenue falls short of the interest charges on the capital laid out.
- 200. Q. Now jurn to the Mutha Canal, do you know that the capital outlay was 02 lakks and the interest 62 lakks. Why is the interest so high?—The work was spread over a number of years and though practically completed in about 1875, there are works still going on which are always to expital. Besides, the yearly net revenue does not yet cover the interest charges on the capital.
- 201. Q. (The President.)—I suppose the dam was very costly and the cost high in proportion to the size of the canal?—Yes, also it took many years to complete the work.
- 202. Q. (Mr. Rajaratna Mdr.)—Do you think it possible that by building storage works you could make the entals pay a larger return?—Yes. At the present moment there are two schemes for increasing the storage of the Muths

Mr. M. Vis. Canal nuder consideration. The proposed storage reservoirs vesvaraya, will probably cost from 15 to 18 lakhe of rupses. They are mentioned in Mr. Reale's report.

20 Dec. 01.

- 293. Q. They have not been forwarded to the Government of Iadia?—No. They are only rough setimates based on preliminary surveys.
- 294. Q. On the first pogo of your answers you give the culturable area as 289,881, what does that represent?—The total culturable area commanded by the new irrigation works in the Posna distrist.
- 295. Q. Will the existing works irrigate that large urea? —That is only the area commanded.
- 296. Q. The actual area irrigated is not given; can you tell what the area irrigated will be when all the works are completed?—I cannot give it for the whole Presidency; in the Poona district about 65,000 to 100,000 acres con be irrigated annually.
- 297. Q. Could you irrigate a larger area if you extended the area of dry crops?—Yes, we could make the Nira Caual works irrigate a larger area if we gavon larger amount of water to dry crops than we at present do, but more area means inferior crops.
- 208. Q. Against the Mutha Canal large revenues are shown under miscellaneous, indirect and direct. Can you explain it?—They isolado receipts from the water-supply to the Poone Centenment, which amount to about Re. 1,25,000.
- 298. Q. On the Nira and Mutha Canals how mush sugarcane or perennial crops is under irrigation?—Under the Mutha about 4,600 acres and on the Nira about 5,600 acres.
- 30°. Q. Can those meas be increased f Yes, if we reduce the other class of irrigation. On the Mutha we have reached the limit, but on the Nira we could decrease the area of rabicrops and increase that under personals.
- 301. Q. I notice that the rabi crop except in years of drought is 14 or 15 thousand?—That is during years of very seasonable rainfall: ordinerily the area is about 25 thousand acres.
- 303. Q. On page 4 of your Noto you say that irrigation works get no oredit for increase in land revenue. On you get no oredit?—We get practically none. They get 90 per cent. in Sind. We do not increase the had revenue bere on account of the emals Perhaps you refor to 2nd class irrigation works such as bandharas on which a consell-dated rate is fixed. On these we get about 65 per cent. of the consolidated rate oreulted to the works. Under first class works no portion of the land revenue is credited to the works.
- 303. Q. If you add the water-rate to the land assessment, what proportion is the water-rate?—The Nira Canal is what is called a Capital Account work and land-rate and water-rate have no connection with one another. In the case of second class works, the figures are given in the Irrigation Reyenue Report for the Bombay Pre-idency.
- 301 Q. When wasto lands are brought under cultivation for the first time, do you not take credit for land assessment in addition to the water-rate?—No, I am not aware of any such oredit.
- 305. Q Yon say you would have a fixed area for which you would allow irrigation under your "block" system; will not this bonofit only a favoured few?—The blocks, it is true, will be on land owned by a few people, but all the villagers who require to participate, may obtain share of the area by exchange or lease for the period the water-supply is guaranteed to the block. The water-supply to a block will be groated only after the villagors have come to a satisfactory agreement among themselves in this respect.
- 306. Q. You fix the block in the holdings of two or three rayats; would it not be passible to fix a share in each rayat's holding?—If we give a water-apply to any field wherever situated the waste of water would be very serious. The water which would be saved under the block system, would probably suffice for one-third to one-half more area. There is now a lot of wasts from field to field on the distributaries.
- 307. Q. Is your plan workable in practice?—Yos. I think so.
- 308. Q. But only n certain number of rayats will benefit by it?—We propose blocks of 50 acres or more, and we propose that all the villagers should share in the benefits of the fixed area.
- 209. Q. I think there is a serious objection to fix the block at 50 asics. Why not appointed it according to the holdings f-Yes, you may do that.
- 310. Q. According to your proposal the poorer men will be excluded ?—We can easily frame rules to bring in oll

- who want a share. Before sanotioning a block, the cultivators should be asked to come to an under-funding among themselves in this respect. Obtaining land by lease for sugaroane cultivation is a common practice in this district.
- 311. Q. On page 8 of your Note, you say that on the Nira Canal the rate paid is 15 to 20 rupees for sugarcano, is that the maximum; don't you charge 40 to 50 rupees sometimes f—The rate-given is the average rate for sugarcane.
- 312. Q. In regard to clause 3 of the same paragraph on page 8, is the rate charged on the whols area er only the irrigated urea?—On the whole area, whether irrigated or rat
- 313. Q. In regard to paragraph 22 on page 9, have there been no eases of private canals?—Not that I am aware of
- 314. Q. Do you permit the construction of canals if the people consent to pay enhanced water-rates?—If they build them at their own cost, we may remit the water-rate for, say, 10 years.
- 816. Q. In there scope for private canals in the Poona district P—Yes, if liberal concessions are given, but Government should be prepared to lose money. Elther Government should construct the canals themselves or forego irrigation rates for a long time. The people want a quisk return.
- SIG. Q. If we gave remission for five or ten years, would that induce the peaple? Would capitalists take the matter up?—Yes, but there is the question of ownership of land.
- 317. Q. But supposing Government assisted them in acquiring lands?—Then I think extension on minor streams would be possible to a very limited extent.
- S18. Q. Now in regard to the system of applications from rayuts, you know what area is irrigated; could you not dispense with the applications, subject to the condition that if a man wishes to change his four-month crop into perennial he must apply P—There are three or four classes of crops and I do not think it would be possible. ...
- 919. Q. For each village the area is known. You make your approximate estimate and tell the rayat that he is at liberty to take water until he changes his crop. Would that not work?—The cultivators changes he crops so eften that there would be trouble in regard to the sufficiency of the water-supply. I am suio it is not pussible on these canals. If we bound our close to give water, the agriculturists might sow perennial or rabi or any other class of crops. This varies according to the nature of the crops and if a large proportion is perunnial or rich crops which require water, say, in the hot weather, the water-supply may fail. I'er regulation of water-supply, both area and class of crops irrigated should be known.
- 320. Q. Pat if they change the crops they must tell you?—I don't think they will take water on those terms, as they constantly change. The notices would give quito as much trouble as the applications.
- 321. Q. But the notices would be fewer than the applications?—Yes, but it is must necessary that we should know especially in seisons of drought, what crops we are to have.
- 322. Q. You can measure them up?—There would be practical working difficulties. We might do it over a restricted area but not over the whole district. We want to know early what water is required, as we may have to restrict the new sowings of sugarvane or perennial crops.
- 323. Q. I don't see what the diffirnties are?—There would be serious difficulties. Your proposals would do for small tanks, but not for such large works as we have in this district. We must knew within 100 to 150 acres what crops we have to give water to. The crops sown in a good year may extend to a year of drought and fail for want of a sufficient water-supply.
- a sulfinent water-supply.

  321. Q. (Mr. Muir-Mackenzie.)—I notice that in Mr. Brale's report the working expenses of the Nira Caual and only 1.75 in ordinary years and Re. 1 in maximum year. I do not understand the Rs. 3 per eero that you mention in your note. Do you mean both the Nira and Mutha, or the Nira ulene?—About Rs. 3 is the average rate of working-expenses for the whole Presidency. It includes artifisial debits. Tide page 29 of the Irrigation Royenue Report for 1899-1900.
- 325 Q. What about the Mutha?—The average does not hold good for the Mutha Chan, as the crops grown under it are chiefly sugarcane or other perennial crops, and the rate of working expenses for such crops is very high.

\* \*

20 Doc. 01.

- 326. Q. On the Prayam river and the Lakh Canals the average in ordinary years is Rs. 18 P.—That is an artificial rate, not the actual.
- 327. Q. Also on the Kadwa ?—Yes. The high charges in both Nasik and Ahmednagar districts are due to their artificial classification as "Imperial" districts, as explained on page 10 of my Memorandum.
- 328. Q. Ou a work like the Maladevi, which will irrigate 30,000 acres in ordinary times and 60,000 at other times, the conditions are not dissimiler to these of the Nira. Will the irrigation charges be higher than these of the Mira?—No. Mr. Beale had calculated the charges on the maximum area, where is it should be calculated on the average, which will be a much smaller area. If the work is in an Irrigation Division we might expect a little over Re. I though air. Beale estimates Rs. 3.
- 829. Q. I gather that there is no doubt that in years of ordinary rain in il you have a considerable amount of water to spare in the Nira?—We have had no such experience the drought avortook us, but previous to that thers used to be a surplus.
- 330. Q. In a year of good rainfall, might not you dispense with the applications, other than for come, after the monsoon has declared itself?—Nes, but in that case we would have to enlarge our distillularies, as the crope sown might otherwise come to harm. In the monscon there would be no grent difficulty. We do allow the cultivators to take water in the monscon before cauctioning the applications.
- 331. Q. After the monsoon?—After the monsoon we work the rules very strictly, as we have to be very eareful. Otherwise the water-supply may fail and the crops may be
- 332. Q. You generally know about September whether you will have a good minfull. Well if you were assured of that, could you not dispense with the applications!—We have on the Niza about 140 miles of canal and the discharge in the hot weather is often not more than 100 enbio feet per second, and if we disponsed with applications the cultivators would probably use the islade supply up early in the season. We might dispense with applications in regard to the upper 30 nules of the canal, but even in that reach the area under irrigation should be determined by measurement for regulation of the water-supply.
- 333. Q. But if you are sure there would be water?—We have distributaries of limited discharging capacity. They would have to be onlarged so as to be able to carry the maximum supply that might be required.
- 231. Q. In order to get rid of those applications you might increase your outlets?—Yes, we might do that.
- 385. Q. Haro you any hope that if you dispense with the opplications the people would irrigate more?-They won't irrigate much more than they do naw; I think there might be an increase of 5 or 10 per cent. If you remove all restrictions, there would be an increase, but there is the question of practicability. We might try it over restricted areas if a trial is necessary.
- 936. Q. I understand that the prohibition to the cultivation of porennial oraps near towns and villagee is restricted to future extensions only ?-Yes. That is so.
- 337. Q. Do you nee pondrette on the Nira Canal?-Yes, the people are now collecting night-sod in the villages.
- 333. Q. And fish manuro !- Yes, they are using fish maouro also.
- 330. Q. But they do use night-soil in the Nira Canal villages ?-- Yes, they do use it to come extent; they get it from the rubbish heaps. They don't collect it systematically except in Baramatl.
- 340. Q. Mr. Mollison informs us that in Khod they are taking great pains to collect it -I don't know about Khed, I know they use poutrette, fish and oil cake largely on the Nura and Mutha Canals. They get the cake from Gujarat and the Sabarmati.
  - 311. Q. Is safflower cake not uned ?-I cannot say.
- 312. Q. Is it your experience that the people fear en-hancement of revenue if they sink wells?-Though I -Though I

- cannot give any definite instances, that is the general Mr. M. Visopinion.
- 348. Q. Have you acticed that it has any effect in dotoring the people from applying for takavi?—I should not like to say; I have no personal experience one way or the
- 344. Q. You say that if Gavernment construct wolls in private holdings the wells will be more expensive by reason of the cultivators labour not being utilized?—The work will be more substantial and last longer but will cost more.
- 345. Q. If the cultivator can make it for Rs 500, how much will Government spend?—There will be e want of personal interest in Government servants and I think the expenses will be about 50% more.
- 846. Q. To come to this "fixed" area of yours, I undorstand that it is fixed not only in the matter of extent, but also in the matter of locality. You are particularly anxious that certain plots should be fixed f—Yes, my object is to save less of water. Under eld works, you notice, the thals or irrigable areas are fixed in this nay.
- 347. Q. You would like to see large storage tanks in the glifts, do you mean that they must be located in the ghats?

  Not necessarily; suitable sites on the rivers would do well enough. But the further away you make them from the ghats the higher would the dams have to be and mesonry dams are expensive. Very high earth dams are a source of danger in the monecons.
- 318. Q. Would the ghat tanks lond themselves to famino labour? Not often, but people could be employed on the canala,
- 349. Q. Would you kindly tell mo whether you think that the crops in the famine year on the Niva Canal were equal to or superior to the crops grown in other parts in a year of good minfull?—Yes, the yield was equal to that of a year of good rainfall; it was more valuable and fetched higher prices.
- 350. Q. You would nover get n 16 anna crop from the land?-We would often get a 12 to 15 anna crop, but nover less than 8 annas.
- 351. Q. Would you like to see the whole area given up to percanial crops in ordinary years?—No, I would not like the whole area given up to percanial crops. I would like the dry crop to go on by rotation to a certain extent, as they keep the distributaries in order to render the water ing of large areas easy in times of famino at abort notice. It is not difficult to restrict the perennicl areas in famine Years.
- 352. Q. Sapporing the restrictions were removed, would 502. 14. Supposing the restrictions were removed worth it he possible to supply water for the dry crops in famins years?—Yea, but there would be great difficulty after the beginning of the rabi season. We might have a large area to water and an insufficient water-supply.
- 853. Q. If you managed the works on productive principles would it be difficult to make them protective in a year of famine P.—Yes, if managed solely on productive principles in ordlinary years.
- 85%. Q. If you work on productive principles there is great danger of the works losing their protective characteristic in a year of famine?—That is so if by protection is meant the saving of dry crops.
- 355. Q. If a crop is grawn in black cotton soil this year it must be manned to give a good crep the following year; nuless manured an inferior crep will result. That is an established fact; is not that so?—Yes.
- 356 Q. Do you helieve that irrigation is of value in deep black cotton soil without a murum sub soil?-With light Wateringe and sufficient manure, deep black cotton soil may be utilized for irilgation to some extent chiefly for the richer olasses of crops.
- 857. Q. It is a soil not requiring a great deal of water ?

  You. They take garden crops on such soil from rolls.
- 358. Q On-deep blook cotton soils?—Yes; they are irrigated by wells to a certain extent in this and other Decean districts. They are not good for growing, by irrigation, crops usually grown on rainfall.

WITE BES No. 56 .- MR. 11. V. R. KEMBALL, Executive Engineer, Presidency.

2. Q. You held charge of the Poons District in the 20 Dec. 01.

Q. (The President) .- You are Executive Engineer, Presidency District, Bombay ?--Yes.

last lamine ?- Yes.

- Mr H. V. 3. Q. From what you saw of the famine hero, what do R. Kemball. you think would be the best coorse for Government to adopt io order to be prepared to resist another famine?—That is a difficult question to answer. It is a question of ways and means.
  - and means.

    4. Q. Presuming the means were avoilable, what would you suggest?—I would suggest storage tanks in the glants with pick up weirs in the rivers where they are wouted Choiae of tanks as far as possible non the rivers to be filled from the pick up weirs. My owe opinion is that it would be very exponeive to carry water direct by eanals from recognition in the cluster. reservoirs in the ghuts.
  - 6. Q. What do you think of storage casals in the beds of the rivers?—I dea't think they would answer and they would be very expensive.
  - 6. Q. More expensive than reservoirs, at the head of the apply?—Yes. And on the small rivers their filling onunct be ensured.
  - 7. Q. Is there a better chance of finding a site for large reservoirs in the plane or the hills?—In the hills. There are many sites in the hills, but the difficulty is to get the water away from them.
  - 8. Q. Why not lot the water go down to rivers ?—That is what I edvecate, but I buve not given the subject a great deal of thought.
  - 9. Q. You have been on relief works, what do you thick the best form of famine relief labour?—It is more easy to say which is the worst. I think that road metal breaking is the worst. I thought at the beginning that it was a good test of destitution, but I have changed my mind. There who are poor loss heart and those who are well-off are satisfied with small carnings.
  - with small carnings.

    10. Q. You do road work with the molal?—The question is whether the road is wanted or should be maiotained. The present roads were aligned before the railways were made und the alignments are not suitable to present day conditions. What is wanted is roads from the trads centres to the main or goods railway stations. If such new roads were made they would have leavy traffic. Funds for repairs are limited and it is no use meking roads or metalling old ones unless you can afford to maintain them.
  - 11. Q. Were such roads made during the famine? programmo was deficient and few such roads were made. was new to the district

- 12. Q. The country roads are not very much used. Some are not. Roads with light traffic need little making, only roads with heavy traffic need installing. It costs is 300 c mile to maintain a metalled road and unless you can afford this it is a wasto of money to metal it.
- 13. Q What kind of work then do you recommend?—It is difficult to find works that are useful unless you take up tank works. I have no objection to those in the absence of a cheaper form of fumine labour, but they necessitate subadiary expenditure and have to be left unfinished sometimes.
- 14. Q. But I suppose generally speaking they will be furnished afterwards f-Yes, I think the greater the extension of irrigation the greater the prosperity of the country and the greater the power to resist famine.
- 15. Q. (Mr. Higham).—I suppose that in the Poons die-trict there is nothing more to be done in the way of read making?—I think a number of the present reads might be unmade ned now ones made in their places.
- Thou there is room for roads in certain places?-Yes, in places where there are no reads now, but where there should be roads
- 17. Q. Why is metal breaking a bad test of distress f—Because the people don't like it, and cease may oxense for shirking. It requires good management, able-bodied men for ganging are few if the supply of metal for breaking falls short the workers are fined for no fault of their own. The workers who are well off do little and do not care what they care. I found several of the villagers came to the worke only to see their friends. the works only to see their friends.
- 18. Q. The question is, is it n good test or not?—It is a good test, but not so good as I thought at first that it was.
- 19. Q. (Mr. Ibbetson).—I suppose you are living more or less from hand to month as to the matter of famine programmes?—Yes, more or less. It takes time and thought to make a famine programme before I left I put a few useful works in the programme which I could not do before because I was new in the district. The programmes are now complete, but the estimates of the projects are not yet.

WITNESS No. 37 .- MR. E O. MAWSON, C.E., Execulive Engineer, Poons District.

I .- Memo. by Witness.

## POONA DISTRICT.

Mr. E Q Manson 20 Dec 01.

There are two Executive Engineer charges in the Poons There are two Executive Engineer charges in the Pocaa District, one for Irrigation and the other for Roads and Buildings. The whole of the district was affected by the late frame; in the Reads and Buildings office the only works undertaken were the enactruction of new roads, the improvement of old roads and tracts and the collection of a metal reserve. On the construction and improvements of roads a sun of Rs. 4,64,659 was expended, while the amount spent on the collection of metal was Rs. 8,12,015. The works uncompleted at the end of the fuming were works uncompleted at the end of the famine were

Indapur-Baramati Road.—This work is a road improvement scheme situated in the south-east corner of the district; and its construction will facilitate the spread of irrigation on the Nira Canal.

Bhimashonkar-Dimbah Road.—Is a ghat read running east and west in the Northern talula of Khed. It will form a most useful road for bringing hirdu and other bill produce from the Ghats.

Rajenadi-Malsiras Road.—This road connects the Poona District with the most barron talukas of Shelapur.

Paud-Borkas Road—Is a ghat road opening up the hill country immediately to the west of l'oona and will be

most useful in encouraging the hirds and other forest

Walke Parineka Road-Is a feeder road to the Southern Meratha Railway. It is a bill road and will open up the fertile Pariacha valley.

It would be nf very great advantage to the Poona District if the above works could all be completed from Provincial Funds. The Local Funds are not in a position to do more than keep in repair the partiens of the roads and by famine labour, and owing to plague, etc., it will be very difficult even to do this; and there appears an possibility of the muounts spent during the famine being made renamerative, either actively by tolls or possively by the opening up of oow tracts unless the cost of completing the construction is borne by Provincial Funds. The Bhinashankar-Dimban 1.00d is especially mressary to be completed as this link with the Chuts and to the principal religious fair in the district will increese the traftic on the whole of the main roads. There is already a famine programme for the Poona District and this is now undergoing revision and extension. Surveys for new works are now in It would be ne very great advanlage to the Poona Disrevision and extension. Envrys for new works me now in progress to the extent of establishment available and new projects are under preparation. As a gards the irrigation questions (ride Government Resolution No. 2825 of 2nd November 1901), they appertuin to the office of the Execulive Engineer for Irrigation, Poous.

Statement of works completed, etc., under the Executive Engineer, Poona District, during the famine Mr. E. O. of 1900-1901, as required by paragraphs 9 and 120 of Government Resolution No. 2275, Marson.

Famine Department, dated 26th October 1901.

					2(
No.	Name and elsesification of works.	Amount expended.	Completed or uncompleted. Incomplete works it is 'destrable to complete as a charge sgainst Provincini on imperial Revenue	Reasons for proposing their early coupletion and results anticipated.	Remarks,
,-	Construction of new roads.	Řs.			
1	Construction of a read from Rajewadl to Mal- siras and Mawdi.	95,029	Incomplote in respect of masonry works, which would cost about Rs. 4,063. It is not emergent to incur this expanditure.	Rs. 300 can be advantageously speut in preserving the work done from going into ruin.	
2	Construction of a carr track from Khadkalla via Bourkhind to join the Talegaon-A m b e g a o n Road.	13,684	Incomplete in respect of the approach on the south side of the Khind which would cost about its, 30,003.	poned till funds are available.  Rs. 300 can be spent for the	
3	Construction of Talegam Railway Station Road.	19,971	Completed.	******	
4	Construction of a road from Dimbha to Bhimashankar.		Incomplete in respect of the last 3, miles in the ghats,	To make the road fully useful for stuffic both on this aud on the other side of the ghats, it is necessary to construct the last 31 miles and a bridge ou the Goho Nallah. Those would cost about Rs. 28,750.	
5	Coustruction of a road from Paud to Bhoreas.	28,651	Incomplete in respect of nincoury works.	It is absolutely necessary to incur an expenditure of its. 9,023 to make the road passable for cards. Cross drainage works must be done to preserve the work that is already done.	
6	Construction of a road from Junuar to Ghoda.	44,416	Completed		A causeway at a cost of about Rs. 2,000 to the Meens River is, lowever,necessary when funds are available.
7	Construction of a road from Walha to Pariucha.	14,000	Incomplete	To make the road useful as a feeder road to the railway, it is necessary to incur about Rs 8,400 on cross drainage works and other petty items.	
	Metalling or Metal Col- lection on roads.				
8	Collecting metal on the Poons-Sholapur Road.	1,58,184	h		
8	Collecting metal on the Poons-Nasik Road.	2,02,733			
10	Collecting metal on the Bomhay-Poona Mail Road.	95,262			
11	Collecting metal on the Poona-Nagar Road.	3,83,910	Completed .	The metal collected will be used up in repairs and in metal-	
12	Collecting metal on the Junuar Nara yangaon Road.		-	ling the reads.	
13	Improvements to the Inda- pur-Baramati Head.	1			*Rs. 1,566 incurred from ordinary funds to complete unfinished itoms.

Mr. E. Q. II.-Mauson.

I.—Note on the possibility of protecting from drought the eastern portions of the following districts:—Nasik, Ahmednagar, Poona, Satara, Sholapur, Belgaum, Dharwar, and Bijapur.

Dharvar, and Bijapur.

Natural Features.—The western talnkas af Nosik Poons, Sutam, and Belgonm coatain the Gluts with spars running down to the Decenn. This strip of country, varying from 4,000 to 2,000 feet above sea level, is from 20 to 35 miles wide. The rainfall on the western edge of the Ghats is from 350 to 200 inches per aunum while that of the castern side of this strip af coantry is 80 to 40 inches.

Nogar has only one talukn within the Ghat area while Sholapar, Dharwar, and Bijapar lying farther cost have a general lower lovel (about 1,500 feet) with small detached groups of hills.

Parallel to the Ghot line is a strip of country 25 to 30 miles in width with a fairly reliable rainfall of from 20 to 30 inches, while in the castern talukas of Nasik, Nagar. Satara, and Belgoum and in the whole of Sholapur and Bijapur the rainfall (uverage about 28 inches) is variable and liable to fail.

On the Ghnts and 20 miles to the east the rainfall is certain and excessive in amount; while in the middle atrip of country it is practicelly anticient for an 8-anna crop even in bad years and it is probable that any irrigation within this strip of land would need some nursing and would be of high class ar perennial crops.

The ealtivators would wait in the hopes of getting anficient rain, evon if their crops were beginning to wither, rother than pay for water. Moreover, it would be dilimit to give water so as to save the crops over any considerable area when the ground had not been properly prepared nor deries made hecause most of the land in the area under consideration has too great a slope to be irrigable without previous levelling of the fields. Most of the land in this area is good black soil over maram; on which high class and perenaial crops would do well and pay if the water were to be picked up by weirs on the rivers—The Krishno and Rovari Canals in Satorn may be quoted as inslances of this form of irrigation.

The land of the eastern talukas of Nagar, Poena, Satam, and much in Sholapur and Bijapur is poor; there mo atretahes of miles of inwram or shallow soil on which it would not be possible to grow irrigated crops.

The most of the good land is on the banks of the streams and rivors, generally fairly level black soil forming flat ralleys between low ranges of hills or more often hetween the modulating poor land sloping on each side from the block soil. Un account of this notural formation pick np wors at short interruls on the rivers seem to be the most suitable form of protection so as to enable the water to be turned juto the good loud with a minimum length of canni-

There are two principal objections to large storage tank in this part of the Decean which may perhaps partly explain the wont of success from a financial point of most of the works already constructed—

- (1) As n rule it is necessory to have n considerable length of canal with little or no irrigation because the suitable dam sites are not near good irrigable land. The canals have often to be taken through muram in which the loss by percolation is very great.
- (2) The storage tanks have been constructed with a riew to famine relief and not with the object of protection from famine; thus the dams no situated in truets lieble to tailure of rain and the sites hare been selected not as those most saitable for poying irrigation schemes but to provide work where it was most wonted daring previous famines.

The works ore therefore heavily hundicapped to start with and cannot be expected to be connectative nor can they be considered as traly protective, because in ordinary years the rainfall being sufficient for the crops the oulti-vator will not prepare his land for urrigation on the chance of drought, and when most wanted, the water can be only partially token advantage of.

The land which can be protected from large storage tanks with long canals mast, from the nature of the formation and soil in the Decean, constitute a series of isolated areas with large unprotected tracts surrounding them. It would appear odvisable to have a greater number of small works spread over as much country as possible. It seems probable

that such works would also pay become if water for irrigotion can he mode available close to the land to be irrigated; thereby saving the loss hy percolotion in large causls and placing it within the power of a greeter number of cultivators to irrigate sumil areas (for which there would, he a sufficiency of manusolocally) the rayats would be more ready to take advantage of the water in ordinary years.

Further, if a large number of small works with short canals can be constructed the entire local management might be ploosed under the rillage officers and some of the useal heavy establishment charges saved. The conversion of rain crop to irrigated crop load would form an indirect protection, in that the irrigated crop is of greater value than the roin crop, and the not amoont of manoy which is produced by the land is increased. The exact momer in which this increased value is distributed would be a secondary consideration, the main point seems to be that if the value of the crops is increased, the village must be richer as a community and its inhabitants in a better position to maintain themselves during famino.

There would probably be a gradaol tendeacy to increase the irrigated areas us the people begin to recognise the value of a sure and cortain crop of high value in place of the precarious and cheap rain crop.

One possible means by which a large number of small works of the kind outlined above could be constructed, would be by bailding a series of wers on the rivers, the land adjacent to which is generally fit for isrigation.

In rivers with a perennial flow a portion of the dicebarge could be utilised at consecutive illages by the construction af weirs alone, but in order to make such a scheme a success, and to insure protection in famine years, it would be necessary to construct large clorage tanks in the Ghats, from which the quantity of water flowing down the rivers would be augmented. It is necessary to raise the water from its natural channel in the bed of the streem, to near the top of the banks, so that it can be taken off at a convenicat level and distributed over the land. The only means by which this object can be altained, is by the construction of weirs across the streams. It is, however, essential that these weirs should be so designed that during periods of heavy rain, they will open automatically and present no material obstraction to the passage of the maximum discharge of the stream, in order that the flood level may not be taked to any appreciable extent, otherwise the adjacent lands would be submerged and danuged by flood water. So the weir should be constructed of some type of shuice gates.

It is, moreover, necessary that on the cessation of the

It is, moreover, necessary that on the essation of the flued, the slaice gates should close automatically, so as to allow only the diminishing flow to pass the gates, while impounding the water at a nearly constant level above the

With automatic sluice gales acting in this manner the water above the weir is relaised at a nearly constant height, about the level of the top of the sluice gates, and the whole or any part of the discharge of the stream can be directed for irrigation, while the balance of the flow not so used, posses through the sluice gates and flows down the stream.

The antonontic sluice gates illustrated in the drawings at the end of this note set in the monner of ore described, and by their use, the beds of streams can be converted into a series of natural storage reservoirs. While impounding port of the rainfall, which would otherwise run to waste, they canable the percanial flow to be used for irrigation, and allow any balance of water to pass down the salloh. The sluice gates open automatically during heavy rainfall and present no meterial obstruction to the flood discharge of the stream.

With a series of such weirs the rivers which now serve only as water convex for the discharge of the rainfall could be converted into a series of irrigation reservoirs; serving both as the main caunla by which water could he passed down from large storage tanks in the Ghals and distributed by small canals over the orea to be protected, and also forming a series of small reservoirs which would tend to rulse the sub-soil water lovel and improve the supply of neighbouring wells.

The moin objections to the use of automatic slaice gates

(1) Sand or silt may deposit in froat of the gutes and prevent their opening.

Wilb the design appended to this nole—judging from experiments with small gates—an accumulation of 1½ feet of sill against the bottom of n gate 10 feet high will not affect the working of the gates. As most of the pools

formed above the weirs would be 1 to 2 miles long, it is most unlikely, even in rivers with heavy silt-laden water, that this amount would be deposited in one year. As soon as the gates open the silt is at once washed away by the rush of water beneath them—

(2) Trees and floating débris might be carried against the gates and so cause them to jam and prevent their closing.

In relation to this question there are two positions to be considered —

- (a) When the gates are horizontal, passing the ordinary flood discharge, the trees will be caught on an iron bar at the lovel of the F. S. level placed in front of the gates.
- (b) When the river is in exceptionally high floed the water passes olear over the top of the horizontal gates and so the debris would be corried over them.

The nalomatic weirs would prevent the silting up of the streams as in heavy floods during which the gates would be fully open there would be practically no obstruction to the water way, and any silt which had collected above the gates would be swept away, and the river bed would be cleared down to the level of the low ma-onry foundation weir on which the gates are placed.

The sluice gates and their mode of action are described in the accompanying appuadix with statements of cost, etc.

The above proposals may be briefly recapitalated:-

(1) To have a series of automatic weirs on small rivers so as to form a consecutive number of reservoirs from which short canals, which would be managed by the village officials, would distribute the water.

The object of these weirs in the small rivers is-

- (a) To eachly any flow in the river in seasons of drought to be used to prevent the rain crops alying by giving one or two waterings.
- (b) To provide a sories of storage reservoirs, one below the other, thereby mising the sub-soil water and improving the wells.
- (c) To encourage wheat irrigation so that a certain area of otop will be protected permanently for each village over a large area.
- (2) To build automatic weirs in the large rivers such as the Krishnu and Phima on the same principle as proposed for the smaller rivers, but large storage tanks to be built in the Ghats, the water from which will be passed down the rivers and picked up at intervals and distributed by canals.

The Royari canal in the Satara district is the nearest existing appreach to the proposals for small rivers. The canal is 5 miles in length and irrigates 1,200 acres with a net revenue of Rs. 3,645.

The Krishaaa canal also in Satara is somewhat similar to the preposal for large rivers, it larguages 5,000 nores with a not revenue of Rs. 28,974.

### III .- Note on Irrigation on black soil.

As there is considerable variation in the opinions expressed on the possibility and value of irritating black soil, the following suggestion is preposed as a possible reason for the differences of opinion.

The value of black soil for irrigation scems to depend not so mach on the soil itself but on its depth and the underlying strate and also on the amount of water used.

For instance, in deep black soil say 8 foot deep or more as in Surat and Breach or in shallower soil say 8 feet deep bat resting on clay, trap or any impormiable strata, irrigation can be used with great advantage from wells but not from canals.

With an almost unlimited sapply as with canals the cultivators are inclined to use fartee much water, the result being that the land gradually becomes water-logged, or as the Natives say, "cold" owing to the saturation of the lower layers which have no drainage and soon become a mass of cold wet much. Nith well irrigation no more water is put on to the land than is required to mature the crop, as every extra cubic foot of water put on the land means extra labour for the cultivator in raising it from the

With shallow black soil resting on muram or other porous strata the case is different, the excess water from the canal supply soon seaks through the layer of black seil and is carried aff by the porous underlying strata and the land is kept "warm" by the natural drainage, and water-logging is avoided. In the esse of well irrigation only the amennt of water required is put on to the laud and therefore there is no fear of water logging.

- As regards remedies:—Where it is considered advisable to protect deep black soil areas or shellow soil on imperious strats, the only thing to be dene appears to be to regulate very corolly the amount of water passed do we the canal to the actual requirements. If the cultivators at the lead of the canal take toe much water there will not be enough for the cultivators lower down, and when ence the latter recognise that the electrices of water is due to wats on the part of these higher up the canal, they may be trusted to apply their own remedies. No system of drainage would be feasible, the expense would be prohibitative and there would be too much interference with the private rights of individual cultivators.

The less the length of canal the cosicr it would be for the cultivators near the lower end of a canal to prevent waste of water by these higher up. With short canals of say 2 to 3 miles the riliage officials would be able to deal and put sufficient pressure on all offendors.

IV.—Note on the raise of manure and the possibility of its supply for small irrigation works.

There appears to be great difference of opinion as to the necessity of mannre if irrigation is to be made a success. The following is suggested as a possible solution. "Irrigation" is understood in quite different senses by different people. For Instance, under Kharkwasia Canal near Poona the term means high class crops such as suggarcane and garden produce, for such corps not only is it absolutely necessary to manure the land to a high degree but also, in order to be successful, the cultivator must have considerable experience and know how best to grow and rotate the crops.

On the other hand with, "Irrigation," as applied to the protection of districts liable le drought, the term would more correctly be understood as—

- (1) The provision of canal or well water in order to componente for deficient rainfall and so save the min crops in seasons of droughts.
- or (2) The substitution of irrigated orons such as wheat and barley for the rain juari or bajri so as to sayo as large an area aspossible of protected land.

As regards 1.—No more manure than is now used would be required. The crop dying for want of rain can be saved by giving canal water but this would not affect the crop on land in any other way. The substitution of canal water for deficient rule can cause no necessity for extra manure nor can there be any injury to the land as in ordinary years. The crop would have matured by the same amount of rainfall as the water given from the canal.

As regards 2.—The area of permanently irrigated crops will always be limited, but every village has a certain amount of manure, much of which is now wasted but which, with the certainty of a good paying crop, safeguarded frum failure of rain, the cultivators might be laid to use to the benefit of the laud.

The introduction of perennial crops will doubtless be very gradual but the manure question will probably solve itself. The large acreage of sugaronne round Poona and the rates paid there for water show to what advantage high class crops can be grown. If the acreage of sugaronne round Poona is compared with the population and the same percentages applied to any village with good irrigable soil it would appear that when once the cultivators recognise the value of perennial crops they are able to get over the dilliculty about mannre. Of course the chounstances at Poona are exceptional and it is not easy to explain the very high rates up to 12s. 50 per acre that cultivators are willing to pay for water there but it would seem to be to the interest of all concerned to try and make similar conditions in as many villages as possible,

Mr. E. O. Mawson. 20 Dec. 01. Mr. E. O.

Mr. E. O. 1. Q. (The President).—You are Executive Eagineer, Mawson. Pooma District ?—Yes.

- 2. Q. We examined you at Rajkot?—Yes.
- 3. Q. You knew samething about the fumino? —I was in Kathiawar during the last femine. M, provines experience of famice was in Salara in 1896-97; we did not do suything thore besides metal breaking.
- 4. Q. The District was hard hit?—Yes, especially in the ghat district. In 1896 there was too much water and the craps died from too much rain in the west of the district.
- 5. Q. But we heard that the people were perishing far the wast of water ?-Yes, in the eastern parts.
  - 6. Q. Woro you long at Satara ?-12 years.
- 7. Q. What, do you consider, are the wants of the district?—The Western part of the district requires nothing; but the Eastern part which adjains Shalapur is always in a precariaus state.
- 8. Q. Are there no tank works in Smara?—Yes. Mah.wad tank which in the largast irrigates the Shalapar
- Q From your knowledge of the district what is the hest thing in do for Satara?—The only thing is to try and store the water; the slope is rather steep and the water rens off qeickly. This can be done by staraga reservoirs ar dams across rivers like the Krishna. The Krishna Canal irrigries 5,000 to 6,000 acres of land nud it has a woir 20 feet high.
- 10. Q. This is not a storage weir, but only for misiog the ater?—Yes, hat there is a certain amount af starage above
- 11. Q. There is a tauk at Maiai?-Yes, it was made ia the 1876 famine.
- 12. Q That is not dependent on the Ghats?-No.
- 13. Q Do you know why it is not more used?—It is full of water, but the land under command is not very good.
  - 14. Q. Is there a pretty good rainfall there? -Yes.
- 15. Q. (Mr. Muir-Mackenzie).—If it fills, why does it not pay?—The land is not good and the establianment charges are heavy.
- 16. Q. You have gut to keep na Overseer or Assistant Engineer and their wages are charged to the tank because there is nothing else to charge it to ?—Yes.
- 17. Q. But they also have charge of the reads f-Bat the larger proportion is charged to the tanks.
- 18. Q. (Mr. Ibbetson).—With the result that they do not produce rovenne?—The establishment and repair charges swallow up the revenue.
- 19. Q. (Mr. Muir-Mackenzie).—You do get revenue out of the tank?—Na, not when interest an the capital cost is taken into consideration in addition to estallish-
- 20. Q. (Mr. Ibbeteen.)—Yaa seem to look upon it as un accepted principle that all the establishment charges should be charged to the tank. Is it a rule of which the principle has been laid down by Government?—I think it is a genorally accepted rule to charge as much as possible to tank. The tank is Imperial and the reads are Provincial.
- 21. Q (The President).—What is you advice about tanks ?—I would suggest the building of more weirs, they do not salt up like storage tanks. The Krishna Canal pays fairly well.
- 22. Q. How much land can you irrigate from it? About 5,000 acres.
- 23. Q. Will it stand mare extension?-Nearly all the water is used up, we cannot extend the irrigated area much more.
- 24. Q. Are there no small rivers in the viciaity which you sould draw upon?—I think a storage tank or two could be made.
- 25. Q (Mr. Rajaratus Mdlr.).—On some of these works, the warking expenses are much higher than the revenue. On the Upper Man river, the working expenses are Rs. 6,600 and the revenue only Rs. 5,000. We cannot get to the battam of this, can you explain it?—It is chiefly due to the fact that most of the establishment charges go to

- 26. Q. Can you not reduce the establishment ?-I don't think eo.
- 27. Q. (Mr. A the district ?-No, Muir Mackenzie). - Not in the whole of
- 28. Q. (Mr. Rajaratna Malr).—I netice that three out of the five works do net pay their expenses?—Those are pratective works.
- 20. Q. Could they not be made pradactive?—It is diffi-ault to deal with the peaple in the Decean. They will not take water as long as they can got a good rainfall, while you have to keep up your canal establishmeat always in good years and bad.
- 30. Q. Is much sogar-ane irrigated under these works ? -No, very little.
- 31. Q. In the Royarl canal tha total area is sugarcase? That is because it is close to Satara which is a large town and there is pleuty of manure there.
- 32 Q. (The President).—What about the Yerla project mentioned in Mr. Bealo's repart at page 251?—I caunot give you any information.
- S3. Q. Are there mony wells on these canals to supplement the irrigation ?—No.
- 34. Q. (Mr. Muir-Mackenzie).—You are submitting, I understand, a momorandue an Decean irrigation. You suggest that bunds should be made where you have perennial supplies in the rivers?—Yes, I think this would be advis-
- 35. Q. They would not do as famiae warks?-No, then construction requires skilled labour.
- 30. Q. I expect that you could get the canal dane with famine labour! -Yes, the enough, but not the weirs.
- 37. Q. Would there be no difficulty where the rivers run rary deep?—No, in the Deceau District we might have 20 and 25 feet dams; the dam in the Kistna is 31 to 25 feet high.
- 33. Q. Is there no form of irrigation work you can propose as famine labour for extending or conserving the water supply. Say the termeing of the country with tals? The Decean is not suitable for tals.
- 39. Q. You found tanks a very good kind of work in Kathiawar, why not in the Decean? The general slope of the ground is mach greater in the Decean than in Katlinar, and the conditions are not so favourable.
- 40. Q. Wore you quite satisfied, with the form of famine labour you did in Satara district ?-I do not like melal
- 41. Q. What would you prefer to see deno P-I would prefer anything to metal breaking.
- 42. Q. Is it difficult to break metal for road making? Yes, the people's hands take fourteen days to got hardened and the metal must be collected in large heaps cutailing extra cost for entringe.
- 43. Q. What better work is there for them to da F-I would rather see them tarrasing the concern, .
- 44. Q. (The President).—Do the land-ewoors readily consent to this?—I think they would.
- 45. Q. (Mr. Muir-Mackenzie) .- Would you put the 45. Q. (Mr. Muir-Mackenzie).—Would you put the famine labourers on tanks?—Yes, if we could get good sites and the projects were already prepared. There were oo projects prepared for Satsra. You see the preparation of prajects is rather an expensive item and to keep u programme ready requires a lairly big grant for survey alone.
- 46. Q. How much woold it require for the whole Presidency?—Mare than three lakhs a year for three or four
- 47. Q. (Mr. Ibbetsen).—Both you and Mr. Kemball, have spoken of motal breaking as n had test of destitution, what ie the objection to it. That the people do not like it, makes it one af the best tests pessible?—It is almost impossible to get correct measurement. I think the Overseers alwars over-measure; they give oredit for more than is really done. This is not the case with earthworks, which can be measured up in large quantities. The measurements for metal are of necessity for small ameasts per worker, compared with earthwork, so that the oxness per worker, compared with carthwork, so that the excess measurement is cumulative. Earthworks are always easier te check.

# WITNESS No. 58 .- MR. DAJI HABI RENAVIEAR, District Agricultural Inspector, Poona.

- 1. Q. (The President) .- You are District Agricultural Inspector, Poons ?-Yee.
- 2. Q. How long have you been in your present post ?-About 18 mouths.
- S. Q. Please give mo your viows about the irrigation of black cotton soil?—It can be irrigated, but the question is whether rice orops can be grown on it. Some cultivators think it can he, but the only difficulty is that it takes a great deal of water.
- 4. Q. There are many kinds of black soil. We have heard of some in Guzant that will not take irrigation f—In the 'wona district the black cotton coil is not too deep for irrigation and is not widely oracked and can be irrigated. I speak of well irrigation.
- 5. Q. Is it the custom here to irrigate the black cotton soil from rells?—Watered from the wells the crops yielded are good.
- 6. Q. Would it not bo the same on the Nira and Mntha Cauals; is there any difference in the water that comes from the cauals and that which comes from the wills! - The agriculturists say that well water is more nutritious.
- 7. Q. There is no objection to tank irrigation ?-No. The ennal water is said to be cold. The fact is that the people over-flood their fields, and the result is injurious.
- 8 Q. If wells are dug close together, do they injure each other? —If two or more wells are dug in the same subsoil current there is some risk that the first well will run dry.
- 9. Q. How far apart should wells in your opinion be?-In one aere you may have two or three wolls without injury to each other. In Mohail in the Nasik district I know a place where in an aere of land there were three wells.
- 10. Q. Were these wells worked in the season of drought without injust to each other?—Yes, but they had to be deepened. It is usual to dig deeper in famine years. In Poona the water surface has gone down 7 or 8 feet during the past few years.

- 11. Q. Would agriculturists be glad if they were given Mr. Rena-the use of hering teels?—They would not be able to work rivar.
- 12. Q. Do the people understand the advantages of takari?—Yes, but it is hard to get the village Kulkarni to do anything naless he is on good terms with them.
- 13. Q. Could you snggest anything that would make the system casier?—There is a great interval between the time of application and the time of the grant. If the work is entrasted to Manlatdars it would be done more quickly and there would be no trouble.
- 14. Q. Is there any complaint against the 5 per cent. interest charged by Government?—No, the rate is cheaper than the rate which Marwaris charge, which is 18 to 24
- 15. Q. (Mr. Rajaratna Mdlr.)—What are your duties as Agricultuml Inspector!—I have to check the work of my subordinates in the disposition of boundaries. I teet the inspection of crops in the booke furnished, and eoe that tho net area of crops as given is correct.
- 16. Q. Do you measure the area of orop under each well? The Circle Inspectors take tests.
- 17. Q. Are there cases in which the same aren is cropped more than once in the season ?-Yes.
- 18. Q. In your crop return do you show that aron twice or once?—If two neres are under bajri and it is changed for juari, we show only two acres, but in the remark column we show two crops.
- 19. Q. (Mr. Muir-Mackenzie.)—You show the acres cropped and the net crop area?—Yes.
- 20 Q. The acres cropped would be four and the net crop area two?—Yes.
- 21. Q.—What is the cost of an ordinary well?—An ordinary well costs about Rs. 300; a good deal depends on the depth at which water is found.

## TWENTY-FIFTH DAY.

## Poona, 21st December 1901.

WITNESS No. 50 .- MR. E. L. CAPPEL, Collector of Poons.

Memo. by wilness.

I have just returned from the revenue inspection of Indapur and Barameti talukas which are served by the Nira Canal. It was not intended that I should give evidence before the Commission, and I have, therefore, not got figures and details, and can speak only to the general results observed.

## CARAL IRRIGATION.

- 2. General Results .- The irrigated villages paid the greator part of their revonue during the famine, and oupgreater part of their revenue during the famme, and sup-ported great numbers of laboarem from outsule. The rise in prices naturally brought very large profite to holders of irrigated lands. These villages show romarkable indica-tions of prosperity, in m improved etylo of building and in the condition of stock, as well as in the appearance of the people and in the general presence of oil and engar crushing muchinery. Irrigation by cannot not present rates is certainly much cheaper than irrigation by well, and wells in the cannot commanded area are in fact not used, though full of water.
- 3. Instances of individual prosperity may be given. A large landholder who was in debt to the extent of about largo landholder who was in debt to the extent of about a lakh a few years ago, has now paid off all but about 10,000, although during the famine he has got nothing from his lands in another district which form the larger portion of his property. Another large landholder bought land when the canal was under construction. Ho bought land when the canal was under construction. He was a Kulkarni by profession and is now one of the rich men of the district. A very noticeable instance of the general result is the increase of the population and wealth of Baramati town. The population of the town is now 9,400, and in 1891 was only 5,100. In this town there is no crime of any kind and very little clearliers on the canal, although a considerable number of "Takaris"

and other eriminal tribes are located in this tract. The condition of Indapor lown offers n etriking contrast. It may not be very criminal, but is certainly not from from orine, and the general appearance of the place is one of 21 Dec. 01. It has decreased in population, and poverty is everywhere apparent.

4. Drawbacks.—The each irrigation appears to have the following drawbacks: it occasionally produces ealt efflorescence, and there is an approbension that it may exhaust the land owing to deficiency of manure. I have seen a good many patches of salt land, but not large in area, and this evil events so far not to have done much damage. It is probably due to inexperience in the use of the water. The exhaustion of the land is morely articipated and here The exhaustion of the land is morely anticipated and has not shown itself on any aren I have seen. I believe this foar arises from experience gained on the Mutha Caual where a good deal of land has in places become unfit for uso. But I think in these casees also abuse of the water was the cause, as I have generally heard a history of excessive scakage in connection with such hand. Of the water-logging of any extensive tract I have never heard in these parts. I believe that those are minor difficulties and can easily be overcome by experience.

5. Manure—The supply of manure is, of course, an important factor. There is at present come deficiency. Balamaticake is imported from Gujarst, night-coil is used to a small extent, and all kinds of expedients are recorted to. Earth from village site is used and croble manure was brought is from unirigated villages daring the famine, which will probably new cease to be available. I have not heard of "San" being plaughed in the Southern talakas, but I have seen it grown as a green crop manure for well irrigation in Khed or Junnar. I see no reuson to suppose that the prosent deficiency will not be remedied in course of time, or

28 Oct. 01.

Mr. E. L.

Mr. E. L. the use of water will be limited as experience shows the proportion to be used with the manure available. Much of the irrigated area is rich black soil which is unturally very 21 Dec. 01. fertile. At Baramati itself the Municipality is arranging for a latriae system and the cystom of drainage specially calculated to produce large quantities of night-volland drainage manure, which is expected not only to beach the load, but to bring in a handsome profit.

- 6. Irrigation works as employment for famine labour.

  —Irrigation works appear to me to be by far the hest application of funian labour. The Shetphal energy tank for instance will, I believe, change the face of a large area of poverty-stricken country sooth of Indeput, and the labour expended upon it will be a permanent benefit to the people and a seferant point funiant forming instruction in the post warth. and a safeguard against famine just where it is most wanted. The making of roads has been overdone in this district. I The making of roads has been overdone in this district have just travelled upon a road (Baramati to Patas) made during one of the recent famines at great cost, which is hardly possible now for bullock earts in places. The District Local Board has not endiciont funds to maintoin any more roads and cannot keep up those it has theads produced more roads and cannot keep up those it has Iteads produced no return, except in a very romote way, while may tank or canal which brings water on to land at least ensures rovenue and provides labour for outsidere over a large area than that actually common ied. These items alone appear to me to make a strict calculation of direct profit and less on irrigation works out of place. The indirect gain to the country can hardly be eleviated. For lastance, setting aside the great value of the produce under high cultivation and the first that in bud cersons nothing at all would be grawn, there romains the circumstances that allows tall canal irrithere remains the circumstances that almost all canal irrigated land in these ports is made to produce three crops instead of one, year in and year ont.
- 7. Wells.—The question of wells is a very difficult one in the Decean. In Posna an engraceas amount of money (both tagai and private) has been lost owing to the digging

- of dry wells. I have not formed a decided opinion as to why this is. The digging of trial pits is rarely resorted to, and the offer of Government to meet the cost, if water was not found, has not heen pat to use. There is a general impression that the water level in the cost of the district is sinking owing to continuous deficiency of rainfall, and nadoobtedly many wells which held good water when built are now dry or nearly so all the year round. In Indapur, Dhend and Bhlmthadi, the Local Officere disapprove of the use of tagai for wells at prescot, owing to the extreme difficulty of fluding water. I think that borlag machines might be used with adrantage: but this is rather an engineering question, as horing through the Decean trap might cost more than making a trial pit. If it costs less I would lead the machine for nething it water is not found, and would make only a small charge if water is reached. and would make only a small charge if water is reached. Boring in this way might be continued with a wide extension of the tagai system as there would be no hesitation oboat the well with water well ascertained.
- 8. Tagai.—The issue of tagai for wells and otherwise might be improved by the abolition of notice to call for objections, which seems to be unnecessor, and by the empowering of Mamlatdars as was done in the recent famine. And I think that if expedition and regularity in the disposal of tagai basiness is to be obtained, the establishment should be permauently increased. All per cent. increase in the interest rate would cover this and would not be felt as n hardship. Anyhow the fact must be foeed that a large agricultural banking business each as this cannot he imposed upon the ordinary Taluka establishment.
- 9. Dams and Tuls.—There is no room in the eastern part of Pooua for much protection by means of dams and tals owing to the small number of streams, the nature of the country and deficient rainfall. Work of this kind is largely carried out in the Western Division, but this division is not ordinarily exposed to familie.
- 1. Q. (The President.)—How long have you been Collector of Poons?—For vix months. Before that, I was in Dharwar and Balgaum. I have been here in Poons before as an Assukant Collector and as Director of Agriculture. I koow the eastern part of the district very well.
- 2. Q. Have you been there recently F-Xes, I have just returned from the Revenue inepection of the Indapar and baramett talakas which are coved by the Nira canal. I was much strack with what I saw there
- 3. Q. You odyance the novel suggestion that irrigation prevents erime; it is the first time that we have heard this advanced as one of the benefits of irrigation?—Yes, in Baramatu there is no crime of any kind and very little elsewhere on the caual, although a considerable mucher of Takaris and other crimioni tribes are located in that tract. The caudition of Indapur town offers a striking contrast; it may nut be very oriminal, but it is certainly not free from erime and the general appearance of the place is one of decay. It has decreased in population, and poverty is everywhere apparent.
- 4. Q. Is it close to the canal ?-It lies outside of the irrigation area. It is north of the Shetphal tank.
- 5. Q. If more water could go down the causal to Indapar, would the town come ander the inflaence of it? —I don't know. Indapar is a town of only 3,000 souls; it is a decaying place.
- 6. Q. The canale occasionally produce selt efferescence. Hove you heard methods discussed for getting rid of it?—Yee, it is considered beet to let the land lie waste for a few years. So far as can be ascertained sait offlore-scence is olways associated with too much sonkage. If the land is left alone for three or four years and theu irrigated lightly, the salt goes out of it.
- 7. Q. You have seen the salt plains of the Punjab !- Yes, we have nothing like that here, only a field or two at a time is affected.
- 8. Q. Have you tried draining the affected loud?—The conditions are very different here to the Punjah and it is not thought necessary. The question of drainage hardly applies here.
- 9. Q. You allude to the supply of manner being delicient in Balamati, is fish macure used to any large extent?-I had not heard of it until I read an account of Mr. Molhion's evidence; I have no doubt that it is used.
- 10. Q. Have you seen much artificial manare used P-Yes, they use oil cake and night-soil, which they prepare. All kinds of expedients are resorted to to obtain manure.

- 11. Q. (Mr. Muir Mackenzie.)—Are the people using safflower ?—I have not seen it used.
- 12. Q. Karan coke?—They may use it for manure, but I know they give it to cattle.
- 13. Q. (The President).—You say that a lot of money, both takivi and private; has been lost in digging wells whore there was no water. le it true that the local which there was no water. It is the that the local colliders hove gono so far as to say no more takey will be granted?—The water level as the district is sinking and the rayats cannot be induced to dig triol pite. They all put their moasy on the opiulons of native exports, or the local wizard.
- 14. Q. You say that the abelitive of notices calling for objections should be done away with; what notices are those?—A notice calling for any objections against the making of a proposed well; as the land is charged with the improvement.
- 15 Q. In the case of a well, the charge is small and the improvement in the land paye for it?—The netice refers to wells on private property.
- 16. Q. You saggest that the establishment should be iacronsed so as to have separate takayi officers, and that the interest charged by Government chould be increased by I per cent. to cover the cost?-I throw that out only as a suggestion ..
- 17. Q. But there are no facilities for the increase of kavi?—I think the abolition of the notice and nu increase of establishment would improve matters.
- 18. Q. We were told by a large number of witnesses that if advances were made free of interest, and if the existence of water were first accertained by making a trial borner it would etimulate well construction?—I think that the conditions of this district are hardly such as to ensure this. Tokavi would be taken by the rayats, but it is doubten what the results would be to Government. I think that if Government is to give the money free of interest, there chould be some guarantee. If Government can find water, the grants might be given more freely. 18. Q. We were told by a large number of witnesses that
- 19. Q. You recommend boring machines?—Yes, boring machines might be used with advantage, but that is rather an oagineering question, as boring through the Decommend trap might cost more than making a trial pit. If it costs less I would lead the machine for nothing it water is not fuund, and for oaly a nouinal charge if water is recohed.
- 20. Q. (Mr. Muir Muckenzie)—But you would require a large number of machines?—Yes, but we could commence with one apparatus first and obtain more if the tial proves successful.

- 21. Q. (The President.) What course would you advise as the best to adopt to make the district able to withstand sucther famine?—An increase of canals like the Niramost decidedly, and irrigation tanks; but tank facilities are I think, exhausted. If they are not exhausted, I would recommed them in preference to canals. recommend them in preference to canals.
- 22. Q. You recommend the extension and increase of canals similar to the Nira, the sapply of which is sure to be restricted?—I do not know what the engineering possibilities are. I know the Bhemb nover ruas dry. It is entirely a professional question.
- 23. Q. (Mr. Higham.) With regard to dams in the Western part, are they made by the people?—Yes, a good many in the Western part, but there are very few in the Eastern portion. They are of masonry built on rock - beds.
- 24. Q. Is there scope for more works of that kind in that part of the district?—That part of the district is generally free from famine, but it was touched by it this time.
- 25. Q. I suppose it is a district of good rainfall ?-
- 26. Q. (Ur. Ribelson.) You say that the effect of Gor-ernment to make trial pits has not been taken advantage of; was the offer made known to the people?—You, the offer was made known. But it is not the custom of the people to dig trial pits. They prefer to go on the information they get from native, experts and risk their money on it. I do not know of a single case in which the offer was accepted.
- 27. Q. If Government dug the trial pits, would they take lakavi P-I think the idea of the trial pit is foreign to the people bero; they might learn it in time.
- 28. Q. Is there no way to shorten that time?—They are nawilling to spend even Rs. 100 in trial pits.
- 20. Q. But suppose Government lent the money, and the risk was not theirs?—They would not object to that.
- 30. Q. If the offer to dig for nothing was made, would the people take taken if water is found?—The offer was made, but I have not heard of a single instance in which it was accepted.
- 81. Q. (Mr. Muir-Mackenzie.) You know the Dharwar District well; you have a considerable system of tank there?—Yes, in the south-eastern part of the districts, that part of the district is not affected by sourcity ordinarily. I do not know if it was affected in 1890.
- 32. Q. It was pretty soverely affected in 1876?—Yes, but escaped in 1899, but we had to spend three lakhs of Local Fund moneys in the north-castera part on fomine.
- 33. Q. Would you like to see the system of tanks extended?—I think they would be very useful for all kinds of crops; they are of the greatest value in irrigating garden
- 31. Q. Are they used for rice crops?—Yes, the people do trigate rice crops from them in Hingeli and the Ghat districts on the western boundary.,
- 35. Q. Were these tanks considerably out of repair when you saw them?—Yes, a great many wers. It would be a good thing to put them in repair as soon as possible. The expenditure would repay itself.
- 36. Q. (Mr. Ibbetson.) How?—In improved offi-ciency; they now lose a great deal of water. It would give the rayats more water, and an increased area would be brought under cultivation.
- 37. Q. Government has now to remit revenue on land which has gone out of onlivation in that district ?- Yes, but I cannot say the amount.
- 38. Q. Is the amount remitted very large?—The amount remitted at the present moment is not large.
  - 39. Q. Do you think that the extension of tanks in Dharwar might be facillated if they were given over to the Local Boards with the additional revenues due to the water? I am not inclined to think that that would be a good was of managing them. I do not consider the Local Boards, the best agonoy for carrying out work of that kind.
  - 40. Q. Do you mean that it should be done by the Public Works Department ?-Yos, it would be better done by thom.

- There is a tendency for Local Boards to place their works in the hands of the Public Works Department.

  \*\*Cappel.\*\*
- 41. Q. You don't think it would be sufficient if the 21 Dec. 01.
  Public Works Department prepared the plans and the Local
  Beards carried them out?—I would prefer not to see that
- . 42. Q. Supposing the Public Works Department executed them under the Local Boards, would the Local Boards want to be satisfied as to the revenue they would get ? What interest would they get?—Most of the Local Boards have no money; the Dharrent Local Board has no funds; all its finds were appared in the last famine funds; all its funds were exhausted in the last famine.
- 48. Q. With regard to takevi, would you like to scelthe number of instalments increased?—No, I think the number is already large enough.
- 44. Q. Would you have the instalment: running up to 20 years with facilities for extension?—I do not think there is any necessity for an increase.
- 45. Q. We hear that one of the objections to taken is the rigidity of the collection?—We could give facilities for extension of the payment of instalments.
- 46. Q. But why not do away with the instalments altogether?—There is no reason except that Government runs a certain risk and capital is looked up for a much longer timo.
- 47. Q. Would the rayat in that ease ever ropay the money !-- I was just going to say that he might not.
- 48. Q. (Mr. Muir-Mackenzie.) Why should he over ropay it if Government can find the money ?—That is a question for Government to consider.
- 49. Q. Suppose we go so far as to say that Government should find the money and the rayst pay only the interest, but that we should allow the rayst to repay some part of the capital whenever he cared to do so?—I would like to see that tried, but at first experiments would be necessary. Supposing a dry orop rate is Rs. 2. and you boild a well for Rs. 400 from taken and irrigate two acres, and you charge a water rate of Rs. 2 per acre, the income would only be Rs. 4 per annum for the Rs. 400.
- 50. Q. Don't you think two acres a very modest estimate?—No, not in the Eastern Decem. I think two acros is a fair average. A very good well might run to three acres.
- 51. Q. The number of acres taking the net cropped area is over three acres?—Yes, in the western district, but only two in the eastern. Our pathashal rate is its. 8, but we could not expect more than half of that.
- 52. Q. If you give a man n loan, he will have to pay Rs. 5 per cent. interest; in the same way I don't see why you should not take Rs. 20 from him on the Rs. 400 advanced?—I think the idea an excellent one, and I would like to see it tried. We could find agriculturists here and there who would be willing to do this at once. It is quite a new principle to me, but I think they would take the last out these terms. the loan on those terms.
- 53. Q. How long do wells last in this district ?—They last for ever it the water insts where the bottom is solid rook.
- 54. Q. In your experience have you over had any diffior the moon the full amount allotted for taken? Properties to the moont might be increased. It depends very much on the interest taken by individual officers. The Assistant Collector and the Manulatdar could is no an enormously large amount of taken. I the Mamlatdars should be given more power and more time. I should like to see them with more power to advance. I think they could be trusted to rise, to their responsibilities. rise to their responsibilities.
- 55. Q. How far would you go? -I would give them the same power that they had during the famine; that is of granting loans up to Rs. 500. I think the thing is too large for European Agency; oven the Assistant Collector must roly on the Mamlatdar, who, I think, could generally be trusted.
- 56. Q. I am afraid the Mamlatdars have not always come up to the scralch; have there not been some cases of grave suspicion ?-Yes, that is so.

## WITHESS No. 60 .- SARDAR COOP DOSWAMT MUDLIAR, of POODS.

#### Extract from Memorandum by Witness.

Sirdar Coopeoswamy Mudliar.

Oil engines with numps attached are considered very occasional and useful for agricultural purposes. They are attended with no danger, and do not require the services of an expert to work them, as to the case with steam power. I have only lately put up an oil engine with a centrifugal pump by blesses. Tangyer, of Birmingham, in my farm at Hadapsar. It is capable of irrighting about 4 acres per day

- of 8 hoors, the cost of oil daily used being about Ro. 4. I have not had sollicient trial and experience of the engine to say anything with certainty, but I have hopes that it will work satisfactorily. In connection with this I have received cordial advice and assistance from the Executive Engineer for Irrigation, who is watching even now with interest the progress I ma making with my ougles.
- 1. Q. (Mr. Muir-Mackenzie.) You own a considerable amount of land in this neighbourhood?—Yes, 100 acres.
- 3. Q. What would you say is the ordinary cost of a well, 30 feet deep, in tolorably good soil?—Much depends on how soon you reach the supply of water.
- 4. Q. For a well that would supply one mot with no tran for 15 or 25 feet?—About Rs. 250.
- 5. Q. Is that not rather cheap?—No, the rayat would not build it strongly, but simply sufficiently well to serve his purpose. There are plenty of such wells which do not cost more than Rs. 250; only a portion of these wells are built op with massory. With olight repairs they last more than 30 years.
- 6. Q. You menn ouch repairs as the rayat can do himself?—No, the carpenter and the bricklayer would have to be requisitioned.
- 7. Q. What interest has the rayat to pay to the sowear?
  —It varies from 15 to 20 per cent. per nunum. Seldom less than 16 per cent., oven if the applicant is perfectly solvent.
- solvent.

  8. Q. Would you be glad to see the interest of 6 per cent. charged by Government, lowered?—No; it is low enough, but the people ore reluctant to take takavi. They would be glad, if the loan were given with certain assurances. They are afraid of borrowing from Government, us the State has great power over their lands. They prefer the sowcar, who is somewhat lax in the recovery of instalments. They do not expect postponements of instalments from the Government. They have difficultles in regard to payment at times, and they find the banis mure lement than Government, though he does charge heavy interest.
- 9. Q. Supposing the Government took only interest with no instalments of capital?—That would be a great relief. I do not think it would have the effect of making the mynt never pay back anything.
- 10. Q. Would it be necessary for Government to lower the 5 per cent. ?—No, it is quite reasonable.
- 11. Q. Yoo have seen a good deal of the Mutha Canal irrigation. Is it doing damage to the soil?—It generally does good; it is not the use but the nines of the water that does herm. The people over-water. When they use too much water, they have to put in a large amount of manore. It does not water-leg the soil, it it is pidiciously applied.
- 12 Q. Would drainage be a remoly for miler-legging?

  -Yes, I know a water-legged garden at Wadg on which
  was sold by the Irrigation Department and improved later
  by drainage, and is now a valuable property.
- 13 Q. Does oalt officereence result from over irrigation or from the character of the canals?—From too much irrigation.
- 14. Q. Do you think that the Canal Department con prevent the excessive use?—I think so. It would stop the cultivotor from taking water if certain restrictions were sade. If the restrictions are reasonable, they will prove beneficial.
- 15. Q. Can you tell us to what extent artificial manares are used on this side?—To a great extent, fish and oll cakes from Gujarat.
- 16. Q. Are they not using Karanj cake?—I do not know; no cultivators in my neighbourhood have adopted it to my knowledge.
- 17. Q. Do you think, if canal irrigation is largely extended, manure in sufficient quantities would be fortheoming?—Yes.
- 18. Q. Have you known any instances of villages at come distance from Poona where night-soil is being osed?

  —I know only one or two instances. It is not general.
- 19. Q. (The Precident.) You recommend in your note that Government should go to the cost of digging wells; would you charge assessment on the wells?—I would not put it on for a certain number of years at the beginning, but I would charge it later.

- 20. Q. Do you think that Government should put up oil engines and pumps?—It would sepay the cost, the daily expense of working 10 HP engine with a five-inch pump capable of irrigating 4 seres a day is only 84
- 21. Q. Why should not the myat do it and not Government?-The rayat has au mouer,
- 22. Q. (Mr. Rajarotna Mudoliyor.) You say all cogines and pumps chould be put up by Government?—Yes, to lift water from rivers or ennals to lands higher than the anni lavel.
- 23. Q. About the abuse of canal water, the you think that the rayat is ignerant of the fact that over-irrigation causes dannage?—They might have a hutle knowledge, but the work is left to servants, and they are careless. They let the whole field fill up, and make no use of the distributing beds. The canal rules are thus frustrated.
- 24. Q. (Mr. Ibbetson.) It would mean more labour to lead the water from one bed to another?—Yes, they now allow the little beds to overflow.
- 25. Q. (Mr. Muir-Mackenzie.) They don't get water when they want it, and when they get it, they take all they can?—Yes, it is due also to the uncertainty of supply.
- 26 Q. (Mr. Rajaratna Mudaliyor.) You propose feeding the existing works with canal water f—Yes, the rayans would pay, but what is wanted is that they should be deg by Government.
- 27. Q. Would Government be able to recoup itself by lerving a water rate?—Yes.
- 28. Q. Do you think that application for water should be dispensed with ?—No.
- 20. Q. You apply for water for one season, why not apply for it for so many years?—, think it would be a good pan, but there is an uncertainty of water-apply.
- 30. Q. Is there much delay in getting senction for applications for water?—No, only in difficult cases, which have to be reserved for the consideration of the higher authorities. Ordinarily, it takes about a month. In urgent cases, n pass is issued by the empercisor. The regular sonction of the Executive Engineer takes a month, but the pass can be obtained in alr days.
- 31. Q. (Mr. Muir-Markensie.) Do you think the pass might be issued by an officer not so high as the Executive Lugineer?—Yes, I don't think any harm would result from that.
- 32. Q. (Mr. Rajarstnu Mudaliyar.) Do yon know whether the rayuts are in feavof enhanced accessment, if they dig wells?—Yes, they are always opprehensive, when they change a dry crop to a higher class crup.
- 33. Q. Is there not a rule prohibiting the raising of astersment on account of improvements?—Yes, but the rayato are not aware of it.
- 34. Q. (Mr. Ithetson) Have you ever taken canal water for your rabi crops?—Yes. I always have to lift my water. The count does not rome up to my land.
- 35. Q. Do you make your men take the water always or do you wait for the rainfall? I always take the water: I never depend on the rainfall. When the ordinary cultivator sees that there are no rains, then be takes the canal water.
- 36. Q. (Mr. Muir-Maskenzie) Do you get a superior crop by your method?—Yes, I increase the yield by one-fourth.
- 37. Q. Perhaps halff-Yes, it might improve by half.
- 33. Q. Do others do as you do !—These facilities cannot be had, unless the canal is close by, and, again, those who cannot afford to lift the water or my for it must depend on the rainfoll.
- SP. Q. (Mr. Ibbeteon.)—On what soil do you grow crops?—Two-thirds is black cotton soil; the rest mixed. I have irrigated rabi crops in deep black cotton soil.
- 40. Q. How deep P.—The depth is three feet, and lower down there is loose morom.
- 41. Q. Supposing the cultivator naited in the hope of rain in October, huw long would it take for him to get

conal water, if he weited till the lost moment?—It depends on the amount of water there is in the canal. If there is plenty of water, he would get it in 10 or 14 days. If the water is short, he might not get it at ali.

- 42. Q. Then he might lose his whole crop?—Yes, they do suffer in that way sometimes.
- 48. Q. (Mr. Muir-Alackensic.) What is the average area which a well, costing Rs. 250, will irrigate P.—It wills with one mot, irrigate 8 or 4 acres of ordinary crops.
- 44. Q. What work does your pump do?—The lift of my engine is 30 feet (9 feet suction; 21 feet delivery).

nse it to irrigate all my land. The source of the sumply is the canel water, which I collect in a tank. The total area irrigated by it is 20 ecros.

45. Q. Do you use it for bajri?—Yes, when the monsoon is lote.

46. Q. (Mudaliya Rajaratna Mdlr.)—What water rate do you pay?—I pay half rates, because I lift my own water.

47. Q. (Mr. Ibbelson.) What did your engine and pump cost?—It cost me Rt. 2,400, including erection, and the building cost Rs. 700 more.

WITHES No. 61 .- Hon'ble Me. J. Tate, Chief Engineer and Secretary, Public Works Department, Bombay.

Witness said: I lay on the table before the Irrigation Commission two notes—one on the subject of the Provisicalization of Irrigation Works in this Presidency, and another regarding the Provincialization of the establishment employed in certain districts. They are accompanied by copies of important letters and orders on the subjects referred to. Neither of these matters has been under the consideration of the Government of Rombay since I because Secretary; but I am prepared to give such further explanations as the Commission may require.

The wilness then read the following note on the question of Provincialization of Bombay Irrigation Works:

Between May 1884, when the Government of India anddressed this Government on the subject, and March 1896 there was some discussion as to the Provincialization of Irrigation Works in Sind on which no final decision was come to, as the question merged in the more general one raised by the Government of India in their letter No. 1013, dated 29th May 1856. This was received in this Department with Financial Department endorsement No. 1772, dated 21st June 1896. While this was under consideration, the "Finance Committee" prepared a note on the subject of Provincialization of Irrigation, and this was sent to this Department with Financial Department No. 311 P., dated 21st October 1896. It appears from letter No. 4347-5, dated 10th October 1896, from the Government of India, paragraph 4, that this Government in the Financial Department addressed their letters Nos. 3667 and 8603, dated 36d Decomber 1886, in which disinclination was expressed to entertain the proposals for provincialization of both major and minor works, and therefore the question was allowed to drop.

In 1896 the Government of India again in their letter above quoted revived it with reference to works in the Decean and Gujarat only, and offered certain terms. The Superintending Engineers were asked to submit forecasts of revenue and expenditure, a note was proposed in the Public Works Department, and eventually this Government in the Financial Department addressed the Government of India in letter No. 907, dated 26th February 1893, and they replied in their letter No. 1705-A., dated 16th April 1895, that they had an present intention of provincializing the Irrigation Works in the Decean and Gujarat.

Accompaniments to above note:-

(1) Letter from the Officiating Under Secretary to the Government of India, Department of Finance and Commerce, to the Chief Secretary to the Government of Bombay, No. 1048, dated 28th May 1886.

In continuation of the letter from the Public Works Dopartment, No. 631, dated the 5th March 1836, I am directed to inform the Government of Bombay that the financial failure of the Lower Panjhra River Works has been noticed by the Secretary of State in the following terms:—

"The history of this project is unfortunately only one of a harra number of records

\* Kadva River Works.

Lath Canal.

Janvis Canal.

Matha Cauxi.

Ekruk Tank.

\* A large number of records of the financial failure of Irrigation Works\* under taken by the Bambay Government in the Decom.

and it leads me to request that your Government should consider whether it may not be possible and desirable to relieve the general revenues from the charges that arise from the interest on the approductive capitat on works of this description, and debit them against the Provincial revenues of Somboy. In no other manner does it appears to me to be possible to bring home the responsibility which attaches to the advocacy of the outlay of borrowed funds on works which wholly fail to produce the returns which alone would justify such expenditure."

2. The Gavernor General in Council has had under consideration these remarks of the Secretary of State, and is of opinion that it would be advantageous alike to the Imperial and Provincial Governments if, at any rate, all the Irrigation Works in Bombay which here been classed as Productive were made Provincial. The Provincialization might take effect from the 1st April 1887. The Local Government would pay interest at 4 per cent. on all Capital ootlay up to that dute, this payment being taken into consideration in fixing the terms of the new Provincial contract. On all Capital outley from 1st April 1837 the Local Government would pay interest on the usual terms, namely, at the rate of 4 per cent. a year on the whole past outlay and half the ontley of the year. The receipts from all the canels transferred would be wholly Provincial, and the increase of the receipts from those canels would be a set-off against the interest payments.

3. I am directed to request that you will be good enough to submit the proposal to His Excellency the Governor in Conneil, and furnish the Government of India with His Excellency's views on the subject with as little delay as the circumstances will permit.

4. I am also directed to invite attention to my letter No. 883, dated the 9th May 1884, and to request the favour of nu early reply thereto, regarding the provincialization of the Irrigotion Works in Sind.

(2) Resolution of the Government of India, Finance and Commerce Department (Accounts and Finance-Provincial Finance), No. 3654, dated 14th October 1886.

Note by the Finance Committee on the Provincialization of Irrigation (with special application to the Punjab).

The present Provincial contracts have nothing intermediate between full acceptance of Provincial responsibility for an irrigation work and its being loft entirely apon the Imperial account. The consequence is that, as an irrigation work can never be expected to be enything but a source of expenditure for some years after it is commenced, the Provincial Governments, if they undertake the construction at all, do so only on Imperial account, and have not the incentive to economy which arises from the introduction of more immediate Provincial interest.

2. The suggestion (for which we were indebted to Colonol Brownlow) which we subject to the Government of India is that the deficulty of provincializing such works can be surmounted by an arrangement upon a basis obout to be described. The arrangement twould be a special subsidiary one and not part of the regular Provincial contract, first, because it is obvious that its duration must be fixed on special considerations and may or may not be the same as that of the regular contract; second, because it must be a slipulation that the money allotted under the orrangement is appropriable only to the particular purpose defined and cannot be used for any other; and third, because it looks forward to a time when an accurring profit may be made invallable for Provincial purposes apart from, and in addition to, what would otherwise be the measure of the allownnee to the Province.

8. The Province would then submit to the Government of India a project for an irrigation work, estimating the amount required for Capital construction year by year, and annual manutenance charges, both during construction and for a period nat exceeding ten years from the opening of the canal, after the expiry of which period, according to the estimate, the revenue would be sufficient to most both mainformace theory and interest on Capital. Open this basis, the Imperial Government would undertake to furnish year by year the money required for Capital construction, but would meantime bear all revenue charges, including that for interest on Capital. At the term fixed (or,

Mr. John Tate.

Sardar Coopas

swamy Mudliar.

Mr. John Tate. 21 Dec. 01.

at the option of the Proriocial Government, at any earlier date) the work would become ofther partly or wholly Provincial as the Government of India may decide.

- 4. It seems on the whole advisable that the responsibility for the interest, which neernes during construction and until the taking over of the work, should rest with the Local Government, and it can hereafter he determined whether these arrears of interest should he treated as a loan (as hetween Imperial and Provincial) and recovered hy unusual instalments, or should he added to the Capital eccount of the work.
- 5. We have discussed the general proposal with the Government of the Paujab, and have ascertained that the principle thus suggested will be cordially accepted, provided that an agreement can be come to is each care as to the figures ou which a contract with the Provincial Government should be based. We, therefore, go on to doal with the question in detail as for as it applies to the Paujah.
- 6. Before any causis can be provincialized, the principle must be decided by which the revenue due to irrigation is to be distinguished from the land revenue proper. We are informed that in the Punjab a different system of calculation exists on overy causi, and in one case the whole revenue is treated as irrigation revenue. These questions will have to be settled between the Government of India and the Provincial Governments with the distinct object of putting an end to any financial doubt or dispute as to the chare in the increase of land revenue which shall necrae to the Imperial or Provincial revenue; and it seems necessary that the method of calculation should be precise and should rest on facts easily ascertainable, and should not, as we believe to the case now in Madras, he merely a rough
- 7. For purposes of provincialization, irrigation works divide themselves into the following categories:—
  - A-Works for which soparate Capital and Revenue Accounts are kept-
    - (a) of which the Capital Account is so far advanced that Revouus operations are in full working order, the remaining Capital coastruction being on such works us distributaries, which are calculated to bring in revouue immediately;
    - (b) which have not yet reached the whove stage.
  - B-Works of which the Capital Account is not separate from the Rovenue Account, that is, Capital operations are of comparatively small amount, and are ulmost obligatory as part of the maintenance of the work.
- S. To the first category, A (a), belong, in the Punjab, the Western Jumna, the Bar: Doah, and the inundation canale, except the Muzasfargarh inundation canal, which belongs to Class B.
- 9. Officials of the Punjab Geverument have suggested that there may be a little difficulty in provincializing the Western Jumus Caual, the revenue from which is lisole to occasional fluctuations arising from the character of the season. We conceive that it may not be easy to settle with the Provincial Government the estimate of revenue and expenditure at which the caual should be transferred to Provincial; but we have the statistics of meny past years upon which to base an average estimate for the feture, and we do not find that the fluctuations have been lorger in this caual than on those in the North-Western Provinces, which have been provincialized.
- 10. Canals of the Class A (b) are represented in the Punjah by the Sirhind Canal, the Lower Soling and Para, the Chemh, the Sidinai and the Swat River Canal. Of these there is as yet no revenue experience, and they can be provincialized only in the sense and under the system explained in paragraphe 2 and 3 of this paper.
- 11. Class B is represented by the Mazesfargerh Caual, of which the expenditure might be whelly provincialized if it is possible to provide for the separation of that part of the land revenue which is due to irrigation from the land revenue proper.
- 12. Since this note was priated, we have shown a proof to the Lientenant-Governor of the North-Western Provinces, and the principle of the proposal has received from hun the same cordinl acceptance as it has from the Punjab Government subject to the same examination of the figures in each individual case. Sir A. C. Lyall has informed us that he doubts if the Betwa Canni can be provincialized as yet, since, though the mann works and most\_of the distributaries have been completed, the canal has only been

opened for about ten mouths, and the data for estimating its future revouns are not sufficient. His Honour would, however, willingly causent to the construction of the Sarda Canal on the suggested terms and conditions.

ORDER.—Ordered, that copies of the note be forwarded to the several Local Governments (except Control Provinces and Assam) for an expression of their views no the subject, with special reference to the several classes of canals within their limits, and the possibility of applying to each of such classes the principles proposed by the Finance Committee.

- (3) Letter from the Government of India, Finance and Commerce Department, to the Chief Scoretary to the Government of Bombay, No. 4347-A., dated the 10th October 1896.
- In paragraph 42 of my lotter No. 4282-A., dated the 7th October 1896, it was stated that the Government of India propose to make Provincial in the new Provincial contract all irrigation works in Hembay proper and Gujarat, and that a separate communication would be made to the Government of Bombay. I am new directed to address you on the cohject.
- 2. In a despetch No. 55-P. W., dated 17th December 1885,; the Secretary of State commented on the financial failure of irrigation works in the Deceau and Gujarat, and requested the Government of India to consider whether it would not be possible and desirable to relieve the general revenues from the charges arising from the interest on the Capital outlay on unremunerative works, and debit them against the Provincial revenues of Bombay. These remarks of the Secretary of State were communicated to the Government of Bombay in this Department letter No. 1943, dated 28th May 1886, and it was stated that in the opinion of the Governor General in Council it would be advantageous alike to the Imperial and Provincial Governments if, at any rate, all the irrigation vorks in Bombay, which had here classed as Productive, were made Provincial. It was accordingly proposed that all irrigation works in Bombay classed as Productive should be made over to Provincial, the Provincial revenue heing charged at 4 per cent, per aumam on the total Capital outlay and the revenue derived from the transferred works heing credited to Provincial as a set-off against the interest charges.
- B. In October 1886, and before a reply was received from Bombay to the above letter, the Finauce Committee, in reporting on the terms of the Provincial courtect with Bombay for the five years from 1887-88 to 1892-93, recommended, in paragraph 205 of their report, the provincialization of all muor irrigation works is the Bembay Presidency, and the note was forwarded for consideration to the Government of Bembay with this Department letter No. 3686, dated the 14th October 1886.
- 4. These proposals for making Provincial the major and minor irrigation works in Bombay were discussed by the Government of Bombay in their letters Nes. 3667 and 3668, dated the 3rd December 1886, and for reasons stated in those letters that Government expressed their disinclination to entertuin the proposels. Shortly afterwards there came a time of great financial pressure, and the Government of India were, obliged in 1889-90 to levy a special contribution of 173 lakbs from the Bombay Provincial rerennes. The question of the provincialization of the irrigation works was allowed to drop.
- 5. The Governor General in Council is convinced that it will now be ndventageous to effect the provincialization on the general principle of vesting the Local Government with a more direct financial interest in works which are practically under its own coutrol.
- 6. It is not, however, proposed to include Sindh in the arrangement,—irrigation works in Sindh are now in a transition stete,—and for some time to come the expenditure is likely to he heavy and irregular, whilst the revenue prespects are very uncertain. The question is also too closely mixed up with the land revenue of the Province, which caunct he wholly provincialized.
- 7. In the Decean and Gujarat the condition of uffairs is different. The main works are practically complete and the rereduce has attained a stage of fair stability. Subject, therefore, to any observations which His Excellency the trovernor in Council may desire to make, the Goycrament of India propose to make provincial the whole of the direct revenue and expenditure (molading interest on capital) connected with major and minor irrigation works in Bombay proper and Gujarat.

S. The revenue and expenditure figures for these works for the five years, 1892-93 to 1896-97, are as follows:—

Major Works.
In thousands of rupees.

•		1692-93,	1893-01.	1881-93.	1905-08. Roussed	1806-97. Badget.

Livenno Expendituro	•	2,42	3,13	8,05	3,03	4,41
Vel Bescune Cparks	•	1,03	3,20	2,78	1,93	3,40
Capital Expenditure	٠	03	1,51	92	41	79
Total Net Chargo	٠	2,30	3,74	3,07	2,43	4,10

9. For the purpose of calculating the assignment to be made to provincial revenues in the new contract, the Government of India propose to leave out of account the hudget estimates for 1898-97 (which contain some altogether special teatures), and to take the average of the last three years under all heads except capital expenditure on minor works. In recent years this capital expenditure has consisted principally of the outlay on the Mutha Canals and other major works which have failed to fulfil the conditions of Productive Public Works. These works have virtually been completed, and in the opinion of the Government of India a total assignment of Rs. 2,00,000 will be sufficient to meet the requirements for capital expenditure during the five years of the new contract. The not assignment to be made to Provincial revenues in the new contract would therefore be Rs. 7,26,000 made up as follows:—

### Major Works.

					ile.
				٠	4,66,000
ı	•	,	٠	•	1,01,000
					7,20,000

## Minor Works.

Recoune						03,030
Expenditure	•	•		•	•	3,09,000

The interest charge will be really somewhat in excess of Ra 7,20,000, but on the other hand it is assumed that with the outlay of the capital on which the excess is charged the net revenue has also increased since 1891-95.

- . 10. I am to request that the Government of India may be favoured with the views of HIs Excellency the Governor in Conneil on the proposals in this letter.
- (4) Note by the Secretary to Government, Public Works Department, dated 7th January 1898, on the Provincialization of Irrigation Works in the Decean and Gujarat.

The Government of India have decided that it is now expedient to provincialize all Major and Minor irrigation works in Bombay proper and Unjarat, and have forwarded, for any remarks this Government may wish to make, the considerations and calculations on which they have based the assignment they propose during the new pravincial contract.

2. I read the Government of India's letter to mean that the principle has been finally sottled, but that they are willing to consider any observations which His Excellency the Governor in Council may wish to make on their proposals for giving it effect.

3. The Government of India offer Rs. 7,26,000 annially during now contract. In the first place, it is necessary to have a clear understanding of what this Government are expected to do for this amm. I take the offer to mean that for the future the Government of India divest themselves of all interest in or liability for Major and Minor irrigation works as they stand at present in the Deccan and Gnjarat: that daring the new contract they will give nothing more for, and take nothing from, existing Irrigation works, Major or Minor.

The proposal does not to my mind preclude this Government from applying to the Government of India for fueds for well-considered and duly sanctioned projects for new works under 35—Protective or 49—Productive. For minor works, however, I understand that provincial expenditure is limited, and that during this contract no further domand nuder this head is expected to be made.

4. I may now proceed to examino the offer of the Government of India, and its offect on our Establishment charges is the first thing to be considered. The Examiner of Public Works Accounts has deduced from the details of resignment offered by the Government of India that it contains an itom amounting to Rs. 2,82,600 for establishment charges. The actual cost of Irrigation Establishment for 1895-96 was Rs. 2,13,000, and the average of provious three years comes to Rs. 2,56,000. The charge for Establishment depends on the expenditure, and if this Government accept the assignment offered as containing sufficient provision for expenditure, they may also be satisfied that Provincial Funds will not suffer as regarde Establishment charges. The yearly expenditure during now contract is not likely to exceed that of 1895-98 or to approach the average of three previous years. So I think it may be taken that Provincial interests as regards Establishment are sufficiently safeguarded. Further, under the new contract, the Kasik and Nagar districts, now classified as Imperial, will become Provincial, and it is probable that we shall be able to carry out Provincial works in these districts as all the Imperial Government.

6. The Government of India deal with direct Revenue and Expenditure, and base their calculations on the actual figures of two years 1893-94 and 1894 1895 and on the figures of revised estimate for 1895-96. They offer to Provincial Government a yearly assignment of its. 7,26,000 made up as follows:—

## Major Works.

levied in these works. The revenue for 1897-98 will approach its 5,20,000, and the estimats for 1898-99 comes to Rs 4,90,000. We cannot hope that the revenue of 1897-93, an exceptional year, will continue, but I think we may fairly count on a steady increase up to the figures taken by Government of India. But I am not satisfied that this Government would be justified in accepting the Government of India's estimate of revenue as likely to be reached and permanently assured during this contract. The accepts for 1898-97 were only its. 4,21,721. I think we may count on a small permanent increase in time, but the figures for list five years, which are 442, 446, 448, 471, and 421, do not seem to me to warrant the conclusion that we shall have an average of 456 during the new contract. I would suggest, therefore, that the Government of India be asked to reduce the Item that the Government of India be asked to reduce the item to lts. 4,50,000, which is, I think, the highest average we can hope to attain within the next few years.

7. For Capital expenditure on Major Works the Government of India propose to give nothing. This expenditure comes under two heads:—

35 .- Protective Works. 49 .- Productive Works.

Under the latter it is not probable that any expanditure will be required, but under the former some Rs. 25,000 will be wanted during the five years of new contrast. This sum is small, and it is for consideration whether the Government of India abould be asked to increase the assignment by on India should be asked to increase the assignment by Rs. 5,000, or we should trust to being able to provide the necessary funds or be content with the work as it is. On the whole, I do not think it necessary to raise any objection on this account. There are other works under this head, such as the Chankapur and Maladevi Tanks in abeyance, the Shelphal and other works commenced during the late famine, which it may be desirable to complete as Protective works, but which I do not understand as owning within the scope of the present proposals, but to be prosecuted oo their morts from funds to be provided from Famine Insur-aces Fund when projects have been approved and sanc-tioned. I think therefore that we may accept the proposal to incur no capital expenditare on existing major works, as it cannot be said to be necessary, and would in most cases be throwing good monsy after bad.

8. For revonue expenditure on Major Irrigation Works the Government of India offer Rs. 1,91,000 against the forecast of Rs. 2,10,815 and the actuals Rs. 1,99,407. We are cast of its. 2,10,510 and the actuais Rs. 1,90,407. We are usked to take same Rs. 8,000 less than the average and Rs. 19,000 less than the forecast. The figures of the forecast are largely based on increased cost of revenue. It is not probable that special expenditure of any kind will be incurred which does not promise a return more than sufficient to cover extra cost of maintonance. During the last five years the reneue expanditure has varied from Rs. 1,76,844 to Rs. 2,25,892, and the average of the three years taken years the revenue expenditure has varied from Rs. 1,76,844 to Rs. 2,25,882, and the average of the three years taken into account by Government of India, taking actuals for 1895-86, comes to Rs. 1,89,461. Considering then that capital expenditure has ceased and no special expenditure is likely to be incorred which will not more than pay for the increased cost of management, I think the Government of India's offer of Rs. 1,91,000 may be accepted as a fair

9. The noxt item of expenditurolis for interest charges which the Government of India take at Rs. 7,20,000, being the average payment on this secount for three years 1893-94 to 1895-90. In the first place, the interest charge is a steadily increasing one, while capital expenditure is being incorred, and the average of any provious number of yests must be lower than the charge for the last year which remains pormanent, provided capital expenditure ceases.

The figures for the three years taken by the Government of India are as follows :-

			Ke	•
1893-94			. 7,12,6	63 ) Average
1894-95	•	•	. 7,21,3	63 99 88   Average 88   Rs. 7,20,000
189 <b>ŏ</b> -D6		•	. 7,26,4	38 } , ,,,,,,,,,,,,,,,,,,,,,,,,,,,,,

These, as explained, show a steady increase, the amount of which in each year depende on the expenditure of the preced-

In 1896-97 the charges for interest amounted to Rs. 7,24,333, and the budget figures for 1897-98 are its 7,30,000. In future the amount of this always will not fall below that of 1896-97, viz., Rs. 7,28,339, but will exceed it by the interest on Capital expenditure in that year and while each expenditure is being increased.

It may be taken that this expenditure has now practically

at may be taken that this expenditure has now practically title Revised Estimate of Capital cessed, but I cannot see ou wind the foreign to the state of the seed and the ground this Govern-for interest bereafter to fig. 7,29,619: mont can be asked to take there will probably also be some additional charges noder \$3, which will be stan they will actually thrug the total up to, if not over, 7,30,000.

The more than Re. 7,28,339 the state of the seed of the see

mont can be sked to take less than they will actually have to pay, which will be more than Re. 7,28,339 1 and probably about. Re. 7,30,000, which I think should be asked for.

77,002 93,311 02,517 1,02,235 6) 4,61,186 92.237

should be asked for.

10. Caming now to minor works, the Government of India take the revenue at Rs. 193,000, against a forecast of Rs. 192,237.

Rs. 1,05,704, and notant average receipts of Rs. 92,237.
The figures of the revoune forecast appear to, be based on supposed increase of rates, which is at least doubtful during

<sup>†</sup> Principaliy on the Mutha Canale; part on Verla River Works, Lower Punjhrs, Kaden, Joméa, etc.

now contract. The Government of India arrived at their figure of Rs. 98,000 by taking actuals for 1898-94 and 1894-95 and these of revised estimate for 1895-96 as follows:—

Re. 95,000 Actuals. 95,000 Rovised Estimate.

3) 2,93,000 P7,666 or 95,000

The actual receipts for 1895-96 were only Rs. 96,000, so that the overage of the three years comes to its. 94,000 instead of 98,000 offered. Had the Government of India the actuals for 1895-96 before them, they would prebobly have taken thelewer average of Rs. 94,000, and as these works are scattered, many of them, encoll, of uncertain supply, and liable to damage from various causes, I think we cannot sufely recken on on average exceeding its. 94,000 and that the Government of India should be asked to increase their assignment by the Rs. 4,000 here indicated.

11. For Capital expenditure on Minor works we are offered its, 40,000 o year, and although this is considerably below the foreeast and actual figures, I think it will suffice for all our requirements for the five years of the new contract. The figures of the forecast are largely made up of proposed exponditure on Bokh Reservoir and Kadwa River Works. As regards the former, the Government of India have already refused to have anything to do with it; it has been under disensaion for years, and I do not think there is any chance of its coming up for practical consideration within this controct. As regards the Kadwa River Works, the case is different. Some its, 5,40,000 have circady been expended from on estimate of Rs. 5,85,274 sanctioned by the Government of India. A revised estimate is now under preparation, and had it not been for the famine, would have been ready before this. If on receipt of this estimate it is thought adrisable in the interest of work done to complete this project, I think it only fair to ask that the money (probably about 1½ lakhs) should not come out of the centract assignment now proposed, but be granted by the Government of India, os this expenditure has not been taken into account in fiaming their proposals.

12. It now remains to deal with Revenue expenditure on Minor works for which the Government of India propose to give 1893.96 2,75,193 1893.97 2,75,193 1893.97 2,75,193 1893.97 2,75,193 1893.97 2,75,193 1893.97 2,75,193 1893.97 2,75,193 1893.97 2,75,193 1893.97 2,75,193 1893.97 2,75,193 1893.97 2,75,193 1893.97 2,75,193 1893.97 2,75,193 1893.97 2,75,193 1893.97 2,75 1

follows :--

| Rs. | 7,87,802 | Southern Division | 9,47,143 | Gentral Division | 6,27,275 | | 5) | 23,43 020 | | Average | 4,68,604

The figures for Northern Division may safely be reduced to Rs. 5,00,000 by omitting proposed expenditure on drainage and reclamation works, which in the first place are not connected with irrigation, and, moreover, are not likely to be commenced within this contract. In the Southern Division the Superintending Engineer proposes a very largely increased expenditure on old tanks. I do not think there is any probability of our being able to spend much more than we have been doing, at least during the next three years, and by reducing the forecast to Rs. 6,10,000 we leave sufficient for our requirements. The forecast for the Central Division may be taken pretty nearly as it stands of Rs. 6,20,000. Our requirements then ore—

| Rs. | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division | Southern Division

or an average of 3,46.000 for the five years. This sam is based on estimates more or less untrastworthy, and cousidering that we have only been able to spend Rs. 3,10,452 on an average during the last five years with the Government of India to draw on, I am joelined to think what they offer now will be as much ne we can profitably spend during now contract.

Mr. John Tale. 21 Doc. 01.

13. To sum up, I think the figures for expenditure taken by the Gevernment of India are fair and will admit of the works being kept in fair order and allow of their operations being extended as far as it is probable that this Government would be able or prepared to go within the period of new contract. As explained in paragraph 9, it will be necessary to ask for an addition of Rs. 10,000 to the item allowed for interest charges, and I think the Government of India have taken rather a sanguine view of the revenue both from Major and Musor Works, and one which I think, with the actual figures for 1895-96 and 1896-97 before them, they will readily see the necessity for modifying. As explaiced, I would suggest that the revenue from "Major Works" be taken of Rs. 4,50,000, and that from "Minor" at Rs. 94,000, which will have the effect of increasing the proposed assignment by Rs. 10,000 and bringing it up to Rs. 7,36,000, and this with the Rs. 10,000 extra for interest charges will bring the total assignment to Rs. 7,46,000, which I consider is required to make the proposal fair and safe for this Government. I would also suggest that the position of this Government as regards the Kadwa River Project and the undertaking of whatever new works under "35-Protective" or "49—Productive" may be found to fulfil the necessary conditions after full investigation be clearly defined. I have one more remark to make regarding drainogo works in Gujarat, for which large expenditure was proposed in Superintending Engineer's forecests. These works have been very successful so far, but they are in ne way connected with irrigation, being in reality land improvement works. From past experience I anticipate there would be no great difficulty in getting future expenditure olassified as productive and fnods provided under "49"; in any cose, it seems to me that the charges should be against Land Revoune and not Irrigation.

#### (5) Letter to the Government of India, Finance and Commerce Department, No. 907, dated 26th February 1898.

With reference to your letter No. 4347-A., dated 10th October 1896, in which proposals are made for the proviocialization of all irrigotion works in the Deccan and Gujarat. I am directed to request that you will be so good as to state, for the information of this Government, whether the decision which the Government of India boye arrived nt in regard to the terms of the provincial settlement for the remaining four years of the carrent quinqueonial period and which has been communicated in your letter No. 711-A., dated the 10th instant, extends to the irrigation works in the Deccan and Gujarat. I am to state that His Excellency the Governor 10 Council is now prepared to examine the proposals in dotail, but that in the present financial circumstances he would prefer not to undertake a new service under somewhot speculative conditions. I am to observe that the direct revenue by no means represents all the profit to Government of these irrigation works. In many places the income is in the shape of consolidated extend this eystem, which is credited entirely as land revenue, and where there is an assured supply it may be expedient to extend this eystem, which gets rid of many administrative difficulties. Even where there is no increase of assessment at all on account of water advantages, load below tanks benefits from the raising of sub-seil water and the facility of making serviceable wells, and the revonue from it is thus secured. In those circumstances, as land-revenue is mainly Imperial, it is oppropriate that the expenditure on works which so greatly affect it should be also Imperial. The Government of India recognize that this principle should be applied in Sind, and the connection of the irrigation works with land revenue in Gujarat and the Decoan differs only in degree from each connection in Sind.

2. If the Government of India decide that this Government should proceed with the consideration of the provincialization scheme, it will be necessary to settle what arrangements are to be made for the completion of the protective works which have been begun as famine works. This Government cannot, of course, provide the necessary fund under the existing form of settlement, and as the remarks

Mr. John Tate. 21 Dec. 01.

above made would especially apply to them, the provincialization even of maintenance and interest charges after completion of the works would be of doubtful propriety. The provision of the capital is certainly a matter of famine insorance, and should, the Governor in Council considers, be made as such.

(6) Letter from the Under Secretary to the Government of India, Finance and Commerce Department, No. 1705 A., dated 15th April 1898.

I am directed to acknowledge the receipt of your letter in the Financial Department, No. 907, dated the 26th February 1898, and in roply to easy that the Government of India bave no present intention of provincializing the irrigation works in the Decean and Gajorat, and that the decision contained in the letter from this Department, No. 711-A., doted the 10th Fohrnary Inst, does not extend to these works.

- 1. Q. (Mr. Muir-Mackenzic.) The disinclination to sottle the question of provincializing the irrigation works was due, I believe, to the foot that we were just beginning the Famine of 1896?—I do not doubt that, but the reasons given were that the financial position of the Government was such that the proposal had to be chelved. The facts are set out in paragraphs 2 to 4 of the letter from the Secretary to the Government of India, to the Chief Secretary to the Government of Bombay, No. 4347, duted 10th October 1896. The letter is nttached to my note.
- 2. Q. There was the difficulty clse, I believe, of revising the Provincial Contract at the time?—Partly that, but there was also the question of establishment. The matter has not come up for discussion in my time.
- 3. Q. (The President.) What is your own personal view on the question?—I think it is more a question for the Finance Department than for the Public Works Department. We have no difficulty in getting funds from the Government of Indie. That Government is old incolly in getting funds for improvements, if fair reasons are given, Leaving the financial question out of consideration, the present orrangement is best for the works, as we can get all the funds we want. They are better maintained probebly than they would be, if the Government of Bombay had to find the money out of limited funds.
- 4. Q. (Mr. Higham.) The Government of Bomhay is just as likely to give money no the Government of India, it is can be spent profitably?—Yes just as likely, if they had it to give.
- 5. Q. (Mr. Mair-Mackenzie) In regard to oivil roads, which are Provincial, the grants are as liberal as Government can unke them, are they not ?—Yes, I have no apprehension that the Department will be less favourably treeted if provincialization takes place.
- G. Q. (The President.) Are there any irrigation works in this Presidency that are treated as Provincial?—Yes, one, the Gokak Canal, but the conditions of this are peculiar.
- 7. Q. Haw nro Productive and Protective works distinguished? -Productive works constructed from loan funde; Protective works are from Government of India moosy.
- 8. Q. And the fact that the works are Imperial leads to anouslous establishment charges?—Yes. With the permission of the members of the Commission, I will read the note I have prepared on the Provincialization of establishment charges.

The witness then read the following note on the Provineialization of Establishment and Mode of distributing Charges --

The provisions which regulate this are contained in paragraphs 2110 and 2120 of Volume II of the Public Works Department Code. The nature and extent of the application of these rules are explained in Government Resolution No. 1903 dated 14th December 1894.

In their Recolution No. 316-31—A.I., dated 21st September 1875, the Government of India sanctioned certain rules for apportionment of cetablishment charges. By Government Resolution No. 454, dated 15th September 1879, certain additions were proposed to meet the special exigencies of this Presidency, and the approval of the Government of India was applied for in letter of the same apparent and dot. The Government of India declined to make any change in the rules. A further communication was addressed to the

Government of Indie, No. 631, dated 24th December 1879. That Government theo naked for forther information, but no commonication appears to have been made.

In 1887 "Irrigation" as a separate Department was abolished. The effect of the orders regarding treatment of certain districts as Provincial and Imperial was considered, cod as a result orders were issued to the Examinar in memorandam No. M-39, doted 10th July 1889, in which the following divisions and districts were treated as Imperial:

Divisions.

Districts.

Sind . All in Sind. Central . Poonn Irrig

rul . Poonn Irrigation.

Nira Canol (since abolished). Khandesh Irrigation.

Ahmodungur.

Násik.

Belgonm and Dhárwár (now Dhárwár Irrigation).

The proposals of this Government were approved by the Government of India in their letter No. 1078, dated 9th July 1889. The Government of India, in their letter No. 145 A. G., dated 8th Soptember 1888, painted out that the omeants charged to Imperial Irrigation in the Ahmednagar and Nasik districts under the above arrangements were charged the stricts and the stricts of the districts of the di

The matter was considered and this Government addressed to the Government of India letter No. 1289, dated 14th August 1894, in which it was proposed to provinciolize the office of the Superintending Engineer, Central Division, nlong with the two districts referred to, and it was suggested for the consideration of the Government of India that an additional annual groot of Rs. 30,000 to Provincial should be made.

The Government of Indie asked for some further information, which was given in this Government letter No. 1925, dated 19th December 1894. Certain further information was also furnished with letter No. 538, dated 21st March 1895. No reply from the Government of Indie has been received, and the Dietricte and Divisious referred to are still classed as Imperial.

A statement showing the actual cost of Establishment under all heads for the tea years ending 1900-1901 is attached with copies of the important letters montioned in this Note.

Accompaniments to note:-

(3) Letter from the Secretary to the Government of India, Public Works Department, to the Secretary to the Government of Bombay, Public Works Dopartment, No. 145 A-G, dated the 8th September 1893.

No. 145 A-G, dated the 8th September 1898.

In forwarding herowith a statement showing the distribution of the cost of executive establishment in the Almodusgar and Nasik divisions for the five years ending with 1893-94. I am directed to observe that, owing to the fact that these divisions are classed as Imperial divisions, the amounts obargeable to Provincial and Local Funds on necount of establishment (inclusive-of Direction and Accents) are calculated at 23 per cents on the outlay on works and repairs in accordance with Public Works Department Code, Volume 11, Chapter XV, paragraph 132, the balance of the establishment charges after deducting the share chargeable ta Imperial Military Works, Civil Works and Barrack Deparlment, being debited to Imperial Irrigation. The amounts eo charged to Imperial Irrigation Works ore abnormally high, the percentage on works

of executive establishment only ofton exceeding 150 Mr. John per cent.

2. When the proposal for the amalgamation of the Ahmeduagar and Nasik Provincial districts with the Irrigation districts and their classification as Imporial was approved in Public Works Department letter No. 1978-G.; dated 4th July 1889, the Government of India did not anticipate the annually of establishment charges in a division in which Provincial and Local Fund expenditure predominates being distributed so unegoally, that the percentage on Imperial Irrigation expenditure on works and repairs would amount to over 150 per cent., while that upon Provincial and Local Fund expenditure remains at 23 per cent. only. I am directed to request that the Government of Bombay will report upon the question and consider whether the classification of the divisions in question should not be changed from Imperial to Frevincial.

Accompaniment to Government of India letter No. 145-A.G., dated 8th September 1893.

Nate.—The perentages against Irrigation works with be considerably larger when the charges on account of Direction and Accounts are added to the Executive establishment.

(3) Letter from the Secretary to the Government of Bombay, Public Works Department, to the Secretary to the Government of Iudia, Public Works Department, No. 327 A.—1283, dated the 14th August 1894.

In reply to your letter No. 145—A.G., dated 8th September 1803, and subsequent reminder, I am directed by His Excellency the Governor in Council to state that the subject of provincializing the Nésik and Ahmednagar districts, which are ut present classed as Imperial, has received very caroful consideration at the bands of this Government.

2. The arrangement approved by the Government of India in 1830 included the proposal to classify, as below, the offices which, on the reduction of certain Irrigation

offices, were for the Inture to carry on the mixed duties,

Imperial . Chief or Superintending Engineer,

Nasik.
Ahmednagar.

Provincial . { The Gojarat districts. Satara. Shelapur.

The other offices remained either purely Imperial Irrigation or purely Provincial. Thus, in three offices, the Irrigation duties were combined with Provincial, and in other three Provincial duties were added to the Irrigation.

Mr. John 21 Dec. 01. 3. I am to remark that, although the question before this Government is the provincialization of the Masik and Ahmedaagar districts only, His Excellency the Governor in Conneil is of opinion that a complete solution of the matter requires that the office of Chief (ar Superintending) Engineer, Central Division, should be included with these; for, were the two districts named to be mede Provincial, the office of Chief Engineer, Cautral Division, would alone among the mixed officer, respiration and the nature onteo of One Engineer, Cautral Division, would alone monog the mixed offices, remain Imperial, and the nature of the then charge would offer no groands for euclin olassification to continue. Whereas, at present, the Central Division consists of four Imperial and three Provincial districts; it would, \*Imperial.

were Nosik ond Ah-Poona District. Khandesh District. Sholopar District. ineduogar provin-olnlized, comprise hnt two Imparial to five Provincial dis-Poona Irrigation. Khandesh Irrigation. Rásik. Ahmednagar. tricts,† and it fol-lows, in the opinion lows, in the opinion of His Excellency the Governor in Conneil, that, if the Násik, Ahmednage Poons, Khandesh, Sholaner daagar. Poone Irrigation. Khandesh Irrigation. of the classification

two districts be changed from Imperial to Provincial, that of the office of Chief Engineer, Centrel Division, must be changed also.

4. With a view to this, the three offices have been considered together, and the possibility of a further reference bereefter, concerning an anomalous Imperial office, will thne he nvolded.

5. I am now to invite reference to the correspondence that took place in 1887-89 regarding the reductions in establishment in this Presidency, and a brief recapitulation of the measures taken and the results obtained will not be

6. In response to n demond for reductions in establishment, it was decided to abolish cortain Irrigation offices which, at large cost, controlled but little exponditure, and the works in charge of which produced hut an insignificant revenue, and to amalgamate the duties then performed by these offices with those of the general branch offices of the districts concerned. In this way the offices of Chief Engineer for Irrigation, and Executive Engineers for Irrigation, Nasik and Ahmeduagar, Sholapur and Bijapur, Gujorat and Satara were oblished and the duties taken over, respectively, by the Superintending Engineer, Control Division, and the Executive Engineers of Nasik, Ahmednagar, the Gujrat districts, Sholapur, and Satara—all Provincial offices—a saving being thus secured which, on the best of the figures for 1887-88, was estimated to total come Rs. 96,000 per annum. 6. In response to n demond for reductions in

besis of the figures for 1887-88, was estimated to total some its, 96,000 per annum.

7. Had changes ceased there, it was estimated that this large saving effected in the Bombay establishmeate would have been almost entirely to the ndvantage of Imperial Fnuds, it having heen estimated that about Rs. 1,000 manually only would be saved to Provincial, the histonic of Rs. 95,000 going to Imperial. This was considered to be an inequitable distribution, and to give to Provincial on inadequate share of the savings arising from occaomies effected in its own establishment; and the saggestion than arose, which was occepted by the Government of India in 1889, to imperialise three of the six offices performing the mixed dutics, and the three offices so imperialised were the Chief or Saperiatending Engineer, Courtal Division, and the Nerik and Ahmedangar districts. The result of this on the besis of the same figures, was, as then calculated, to

epportion the saving of Rs. 96,000 between Imperial and Provincial in the proportion of shout Rs. 84,500 to about Rs. 11,500. Imperial still gitting the very much larger shere, while in addition there was also a probability of fature modifications adverse to Provincial, owing to reductions in Capital expenditare. It must be assumed that the Government of India recognised the offect of the accepted classification, and acknowledged that Provincial was entitled to the share of the savings offected which this ensared.

8. This Government is now asked to consider why the offices then made Imperial should not be provincialized, in view of the fact that the result of the existing system is that Imperial Irrigation is charged with shnormally high percentages for establishment—an anomolous condition of things in districts in which expenditare on Provincial and Local largely predominates.

things in districts in which exponditure on Provincial and Local largely predominates.

9. His Excellency the Governor in Council, I am to remark, fally recognises the anomalies, and for other reasons heyond their romaval would he glad to see these officers classified as Provincial; but ho is of opinion that in approaching the subject, the reasons which led to the adoption of the present classification chould not be lost eight of, and that the principle of leaving to Provincial a fair share in the economies officeted by the amalgation of offices should he maintained.

10. I am directed to present to the leaving to Provincial a fair seems of the maintained.

10. I am directed to uppond to this letter a statement repared by the Examiner of Pablic Works Accounts, exhiprepared by the Examinor of Pablic Works Accounts, exhibiting the distribution of establishment charges between Imperial and Provincial of the three offices in question, eccording as they are classed as Imperial or Provincial, for the five years ending 1893-94, from which it will be seen that, had the Provincial elessification existed, there would have been an annual average loss to Provincial (and a corresponding gain to Imperial) of Rs. 29,672 during that period.

11. It will be evident from this that, had the Provincial 11. It will be evident from this that, had the Provincial classification existed, not only would Provincial Funds have received an henefit whatevor from the economics offected in 1887-88, but they would bove been put to n clear loss of some Rs. 18,500 annually, while Imperial, instead of saving Rs. 85,000 would have profited to the extent of some Rs 1,14,500, of which Ro. 18,500 would have been actually at the expense of Provincial Funds.

12. His Excelionéy the Governor in Connoil trusts that under these circumstances, the Government of India will

12. His Execlency the Governor in Connoil trusts that under these circumstances, the Government of India will recognise the right of this Government to lock for compensation in the chape of an adequate addition to the Provincial grant, or to an addition to the late of 23 per cent. now received for Imperial expenditure, if these offices are provincialized, and I am directed to suggest, for the consideration of the Government of India, that an additional mounal grant of Rs. 30,000 to Provincial, to enable this Government to meet the additional charges, would be an equitable re-adjustment, nuless the Government of India would prefer to give componsation by a special re-adjustment of

re-adjastment, nuless the Government of Indio would prefer to give componsation by a special re-adjustment of the percentage rates. If the terms of the re-adjustment ran he satisfactorily settled, immediate steps will be taken to provincibilize these offices from the 1st Apili next.

13. I am to submit that, sholad the Government of India not he prepared to great the compensation suggested, this Government would be, it considers, inequitably treated in being called on to sacrifice the small edvantage to Provincial, which, owing to the Imperial classification of these offices, neorged from the economies effected in 1887-88, and to further hurden Provincial Funds with considerable additional charges for Establishment.

Statement of distribution of Establishment charges showing the effect on Provincial Funds during the five years ending 1898-94 if the classification of the offices of Chief Engineer, Central Division and Executive Engineers, Nagar and Nasik Districts, were altered from Imperial to Provincial.

(4) Letter from the Deputy Secretary to the Government of India, Public Works Department, to the Secretary to the Government of Bombay, Public Works Department, No. 137-4.G., dated the 12th September 1894.

With reference to your letter No. 327A.—1289 of the 14th Angust 1894, on the subject of the proviocialization of the Nésik and Ahmedangar district, I am directed to request that you will furnish the Government of India with a statement in the accompanying form showing the total cost of the Public Works Department establishment in Bombay proper (excluding Sind) for the five years ending 1893-94 re-distributed in necerdance with the following principles:—

- (a) The whole of the Public Works Department establishment of Bombay proper to be treated as Provincial and the cost of that establishment divided between Imperial, Provincial and Local Funds in proportion to the outlay incurred on works and repairs from each of those Funds, after deducting the chars chargeable to the University Respectively of the Publishment at 10 per cost, and to the Buildings and Roads and Irrigation Branches on necount of revenue collected at 5 and 10 per cent. respectively.
- (b) If there be a superate Revenue establishment on account of Irrigation works, the whole cost of that establishment to be charged to Irrigation instead of the 10 per cent on Revenue.
- (c) The charge to the Harrack Department to be calculated in accordance with Public Works Department Code, Volume II, Chapter IV, paragraph 147, clause iil.
- 2. The total charge for establishment to each fund will thus be made up of the sunre calculated at the proportionate rate mentioned in paragraph 1, clause (a), plus the revenue collection charges.
- (5) Letter from the Secretary to the Government of Bombay to the Secretary to the Government of India, Public Works Department, No. 513-A.-1923, duted 19th December 1894.

With reference to your lotter No. 137-A. G., dated 12th Soptembor 1894, I am directed to forward herewith a statement, propared by the Examiner of Public Works Accounts, furnishing the information required by the Government of India.

2. I nm at the same time to point out that this Government do not admit that a proportion founded on the total Public Works Department expenditure of the Presidency (excluding Sind) is a fair measure to apply to one particular class of works included in that total, and His Excellency the Governor in Council considers that any such valuation, which omits the special circustances of the class of works concerned and the extent and cost of the supervision necessary for them, is likely to prove misleading.

3. There are now in this Presidency three separate districts maintained specially for irrigation, which cost about Rs. 1,40,000 per amum, and these (Poona, Khandesh nod Dharwar) must, for the present at all events, continue to be kept up for the purpose. With a sufficient amount of capital expenditure, the general rate for the whole Public Works Department (exclading Sind) would meet the cest of these establishments, but there are now practically no capital works, and the expenditure is chiefly for maintenance of scattered works, which is necessarily more costly than the average rate for the Presidency, in which both original works and repairs are included.

4. I am to again ask the Government of India to bear in mind, the large paring, to the langeral Exchanges, which resulted from the reduction of one Ohief Engineer's office and four Executive Irrigation districts in 1897-88. I am to remark that this reduction was offested without cost to Imperial, for the reduction in the number of appointments was not corobined with a reduction in the strongth of establishment by the transfer to the Government of India of the proportionate number of officers, as was done when the Military Works were separated from Provincial, though that this was originally contemplated, is evidenced by pangraph 18 of this Government letter (Confidential), No. R., dated 20th May 1887. Had the Government of India taken over the surplus Irrigation Officers comprising one Chief Engineer, four Executive and four Assistant Engineers or granted special pensions to retire some or all of the officers concerned, the saving effected to Imperial would have been very largely reduced, but, instead of this, Provincial arranged for the employment of these officers, and this increased the saving to Imperial Funds. It is true that the changes made were accompanied by a re-organization of the Department, but this, without immediately leducing the total strength, reduced the number of the higher appointments.

5. I am to say the large benefit derived to the Imperial Exchequer, however obtained, must, in the opinion of His Excellency the Governor in Council, be considered an important factor in the matter now under consideration and it is to compliasize the moint claim to the compensation asked for that the facte have been now again put forward.

Statement showing a re-distribution of the Establishmen' Charges in the Bombay Presidency (excluding Sind) for the five years ending 1893-94, calculated in proportion to the outlay on Works and Repairs prepared agreeably to the instructions contained in the Government of India, Public Works Department, No. 187 A. G., dated 12th September 1894.

Mr. John Tate. 21 Dcc. 01. Mr. John Tote. 21 Dec. 01. (6) Letter from the Secretary to the Government of Bombay, No. 163 A.—538, dated 21st March 1895, to the Secretary to the Government of India, Public Works Department.

With reference to your telegrams Nos. 14 A. G. and 20 A. G., dated respectively the 18th February and 6th

March 1895, I am directed to forward herewith the stutement, prepared by the Examinor of Public Works Accounts showing a re-distribution of the establishment charges in the Dombny Presidency (excluding Sind) from 1886-87 to 1883-89.

Statement showing a re-distribution of the Establishment Charges in the Bombay Presidency (excluding Sind) for the three years ending 1888-89, calculated in proportion to the outlay on Works and Repairs, prepared agreeably to the instructions contained in the Government of India, Public Works Department, No. 137A.-G., dated 12th September 1894.

Witness.—The question of Provincialisation of these two districts is largely a question for the Financial Department. When certain districts and appointments were abolished, there was a saving of Rs. 96,000;—Rs. 1,000 Provincial and Rs. 95,000 Imperial—and this Government claimed some slare of the direct savings it had effected. It was proposed to retain the three Imperial Irrigation Districts which with Ahmednagar and Násik also Imperial, would balance matters. The Government of India, in replying, noted that this would be nafair to irrigation works in the latter districts and requested that an alteration might he made in the proposal. In 1895, the Bombay Government pointed out their reasons for the retention of the old mrangement, but said they were quite willing to after it if compensation for the loss, viz., Rs 30,000 annually, were granted. Further information was called for, but nothing further was done. This was in 1895.

## (Oral evidence continued from page 261)

- 9. Q. (The President.)—There is doubt that the establishment olarges are unfair to individual works of irrigations—They are made according to the code rules. The average establishment charges in the Bombay Presidency for the 10 years cading 1901, on all works carried out was 27½ per cent. the lowest was 2133 per cent. in 1877; the highest 296 per cent. in 1898-99, this being due to restriction of expenditure, while the cost on the Provincial works was 31:12 per cent. The reason of this and only is the large expenditure on irrigation works in Slud, which reduces the potentiago considerably.
- 10. Q. What is the percentage charged to Provincial and Imperial Funds?—It the district is Imperial we charge 23 per cent, to Provincial funds, and the halance to Imperial, and vice versā. The result is that in such districts as Násik and Ahmedangar, which are Imperial, the Provincial funds are charged 23 per cent, and the Imperial a much larger percentage. The irrigation charge is dependent on the amount of Provincial Works carried out during the year.
- 11. Q. (Mr. Higham.)—A good deal of the expenditure comes from local fauds ?—Yes; we charge local fundsonly 12 per cent and the Provincial Government meet the difference between 28 per cent and 12 per cent.
- 12. Q. You say that the Government of Bombay asked to be compensated if the soheme for provincialising the establishments was carried out?—Yes, but we received no unswer.

The reason for which the Bombay Government wished to retain the two districts mentioned as Imperial or got compensation was that they wished to keep their share of the reductions made by the re-organisation at 18-7. We asked for an additional grant of Rs. 30,000, or an addition to the rate of 23 per cent. on e-tablishment charges for works entried out from Imperial funds.

- chaigs for work earried out from Imperial lands.

  13. Q. It was suggested that the average was 26 per cent.:—Yes, there would be no difficulty if this were given. We have had no further correspondence on the subject since 1:95. In 1896 the Government of India proposed to provincialise the whole of the expenditure in the Presidency; they asked the Finance Department for their apinion, and later on a reply was received that they had no intention of provincialising irrigation in the Decan and Gujurat.
- 11 Q. (Mr. Ibletson.)—If allowance is made for revenue, the uctual expenditore would work out to about 23 per cent.—Probably 25 per cent. might be fair. I am not prepared to say exactly what, but I do think some allowance should be made.
- Mr. Muir-Mackensie to Mr. Higham.—The Government of India suggested in 1896 that the whole of the expenditure on irrigation should be provincialised. This was practically a reply to the Government of Bombuy's letter of 1895.
- 15. Q (Ur. Nighan)—Wr.have been told by some witnesses that a distinction has been unde between works called respectively. "Protectiva" and "Productive." Wo are told that the works which are called "Protective" cannot be worked on commercial principles, so as to secure a maximum revenue, because the water saust be preserved for years of drought. Are there any orders on this subject from the Government of India?—I cannot point to any orders, but there is no doubt that we do make u distinction. There are orders, I think, but whother from the Government of India or the Bombay Government, I cannot say. On "Protective" works you make as much as you oan. On "Protective" works you reserve the water for food crops.

  16. Q. I do not see what unthority you have for the
- 16. Q. I do not see what unthority you have for the distinction P—I cannot point to any order, but it is the general practice. On the Nim canal sugar-cane is restricted because it is n "Pioleotice" work.
- because it is no Protective work.

  17. Q. We have heard of various irrigation projects; what is the present slate of the Maladers and Chankaputanks?—The Maladeri project has come up to the Bombay Gavennment in a complete state. It has gone back to the Superintending Engineer for revision and for repor on certain points.

- 18. Q. Do you propose to recommend the project for sanction?—When we got the information, if the results are satisfactory, we will recommend it. The project has already been reported on by the Revenue officers very satisfactorily at various stages. Mr. Mair-Mackenzie himself reported on it at great length.
- 19. Q. I believe the Local Government are still doubtful, as to whother it should be a protective or preductive work do you know whether they have made up their minds?—So far as the Public Works Department is concerned, we shall recommend it as a protective not a productive work.
- 20. Q. What about Chankapur?—It has gone back to the Superintending Engineer for revision; it is with him at present. The plans and estimates were submitted 2 or 3 years aga, but the Government of India asked for certain further informatioe.
- 21. Q. Has the question of the canals proposed in connection with the Inpti and Sabarmati been before the Government in any definite form P—Not lately, the papers are before us.
- 22. Q. They are old proposals revised again. Are they in any definite form before the Government !—Government have called for the papers, and a report on the projects was submitted some time ago, but they have not yet decided what should be done.
- 23. Q. The Wokak Canal, you say is the only Provincial Canal in the Bowbay Presidency ?—Yes, but we do not consider it as constructed for irrigation purposes. A lease was granted to a Compusy many years ago by Government for the supply of water to the Gakak Alills. Government has undertaken to supply their requirements.
- 24. Q. But the Mills do not pay very well for the water?
  —That is so, but we are bound to supply it.
- 25. Q. A good deal of the water in the Gokak River goes to waste, could not some of this water be used for irrigation?

  There is great made in the monocon, but the reservoir ran dry last year in the hot weather for some weeks, and we were unable to supply water in the Company and were liable to chains for compensation, but they did not press the
- 20. Q. I think Mr. Be de has a project for considerable extensions of this work, which we are going to see ?—Yes, Mr. Bedo has three alternative schemes, the estimates of which are over 91 lakks.
